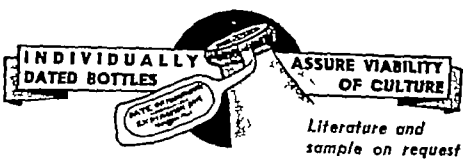
in therapy of

MUCOUS COLITIS



ACCEPTED AMERICAN MEDICAL ASSN

SHEFFIELD B. ACIDOPHILUS MILK*

is of considerable value!

As in chronic constipation,—in the majority of patients with mucous colitis, B *acidophilus* organisms have been suppressed or entirely annihilated by other bacterial forms. By restoring the B *acidophilus*, however, and establishing a fecal flora akin to that of an infant, beneficial clinical results, through regulation of bowel eliminations ensue.

Of course, milk cultures of Bacillus *acidophilus* that are Council Accepted, and husbanded under strict biological control should be preferred for therapeutic purposes. Sheffield B. Acidophilus Milk *meets* these vital requirements and is especially recommended for use in mucous colitis.

Literature and sample on request

SHEFFIELD FARMS COMPANY, INC
524 W 57th Street, New York, N. Y

*Produced fresh daily at the Cheplin Biological Labs., Inc., Syracuse, N. Y., under the personal supervision of Dr. H. A. Cheplin, an authority today on *B. acidophilus* therapy.

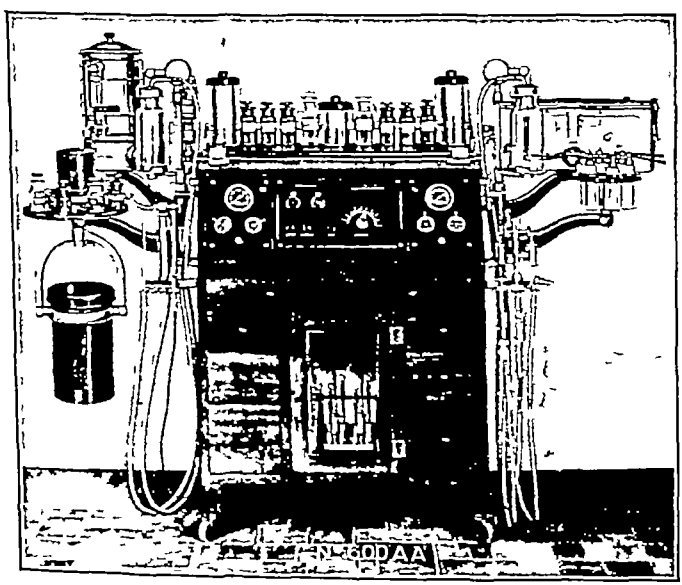
BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages



(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy.

KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

Biliary stasis

For Rapidly Induced and Sustained BILIARY DRAINAGE

The combined use of Decholin sodium and Decholin is an effective means of rapidly inducing intense and sustained choleresis. The former, administered intravenously, provokes a prompt increase in bile secretion by the liver cells The latter, given orally after two or three Decholin sodium injections, dependably maintains the augmented biliary flow. Thus drainage of the entire biliary tree is rapidly prompted and maintained, leading to subjective relief and objective improvement

Comprehensive literature and a copy of the second edition of the brochure "Biliary Tract Disturbances" sent upon request.

SELF-PORTRAIT

OF MANY BUSINESS MEN

MANY a business man pictures himself as a sort of modern Atlas—supporting the fate of the world on his shoulders.

He sincerely regards his work as indispensable to the success of the business, and recoils from anything that he feels might take him away from his job.

That is why it usually is so difficult to get such a man to pay proper attention to his health, even though he is troubled by persistent signs and warnings that something is wrong.

For at any suggestion that he heed these warnings—that he see his doctor—he says "Yes, yes, I suppose you're right. But what if the doctor should order me to stop work for awhile? Who'd take care of my job? What would happen to the business?"

And the irony of it is that by his attitude he is inviting the very thing he fears! For one of the surest ways of encouraging a *serious* sickness is to neglect a seemingly *small* one. Heart and other organic diseases, stomach ulcers, and nervous disorders—diseases to which men in the so-called "prime of life" are particularly susceptible—thrive on neglect.

When you see your doctor he may be sure, prescribe a short rest. But isn't that better than a *forced long* rest later? He might say "Take things a little easy. Leave the office an hour earlier at night." But isn't that better than driving on relentlessly until you're *carried* out of the office?

Let us hope, of course, that your disturbance will turn out to be a minor one—and that its treatment will be simple, its correction rapid. But whatever is wrong, you'll be better off if you start correcting it before it becomes really serious. The most sensible thing you can do, therefore, is to see your doctor *now*.

AMERICAN COLLEGE of PHYSICIANS

April 4-8, 1938

WALDORF-ASTORIA HOTEL

New York City

A POSTGRADUATE WEEK IN INTERNAL MEDICINE and allied specialties covering a wide range of subjects presented by eminent authorities

GENERAL SESSIONS will be consolidated meetings, consisting of about forty formal addresses, revealing the trends and covering the best of recent work in medicine

CLINICAL SESSIONS will consist of hospital visits, ward walks, clinics and demonstration of patients in hospitals, laboratories and medical schools

ROUND TABLE CONFERENCES will cover discussions of timely topics, led by authorities in each particular subject

A SERIES OF SPECIAL DEMONSTRATIONS, dealing with highly technical subjects in special fields, will be scheduled

A TECHNICAL EXHIBIT of special interest will be open throughout the week

INVITATION is extended to all qualified physicians Non-members of the College will pay a nominal registration fee

Address inquiries and requests for Programs to the Executive Secretary

JAMES ALEX. MILLER, M D, *General Chairman*
New York N Y

JAMES H MEANS, M D, *President*
Boston, Mass

E. R. LOVELAND, *Executive Secretary*

Erythrol Tetranitrate

MERCK [Erythrityl Tetranitrate]

The action of Erythrol Tetranitrate on systolic blood pressure

For reduction of high blood pressure

For the relief of, and as a prophylactic for, attacks of angina pectoris

For vascular diseases

- **Vasodilator action slower and more lasting than other commonly used nitrites**
- **Vasodilatation usually begins within about fifteen minutes after administration and persists for 3 to 4 hours.**
- **Individualized dosage may be continued with sustained effect.**

Erythrol Tetranitrate Merck (Erythrityl Tetranitrate) is supplied in bottles of 50 ¼-grain tablets; tubes of 24, and bottles of 100 ½-grain tablets—readily obtainable from your pharmacist

MERCK & CO Inc. *Manufacturing Chemists* RAHWAY, N. J.

Reducing the risk
of severe serum reactions in

SCARLET FEVER ANTITOXIN THERAPY

TIME WAS WHEN PHYSICIANS confronted with a case of scarlet fever felt themselves in a dilemma The use of antitoxin meant a serious risk of serum reactions, withholding it left the patient in danger

Antitoxin was, therefore, frequently given only in severe cases, with the result that many of the milder cases progressed to the severe form of the disease, with a lower expectancy of effectiveness of serum therapy when instituted late

The advent of Globulin Modified Scarlet Fever Streptococcus Antitoxin *Lederle* has changed the old attitude towards antitoxin therapy This potent antitoxin with its greatly reduced liability to cause reactions is now being widely used regardless of apparent mildness of attack The decrease in the incidence of serious complications alone, aside from the favorable effect on the prognosis, far over-balances the lingering hazards involved in the 2% incidence of severe serum reactions following the use of this antitoxin

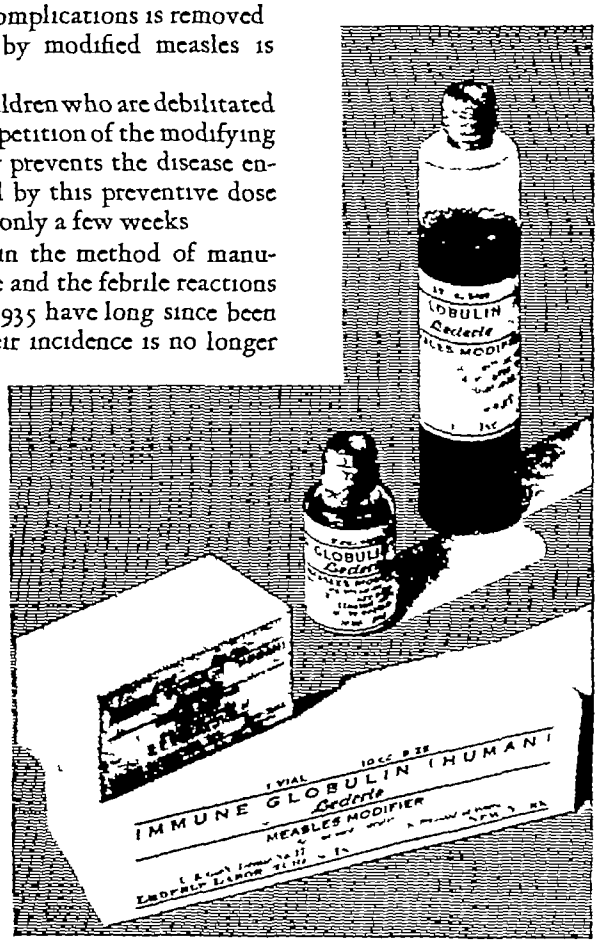
"Scarlet Fever Streptococcus Antitoxin (Globulin Modified) *Lederle*" is available in appropriate packages for both prophylaxis and therapy

Lederle

LEDERLE LABORATORIES, INC.
30 ROCKEFELLER PLAZA NEW YORK

Avoid the danger
of severe complications in

MEASLES



THE CHIEF CAUSE FOR CONCERN in measles continues to be the incidence and severity of complications—chiefly bronchopneumonia—in this epidemic infectious disease

With the measles season at hand, the availability of an effective measure for the control of the disease affords a feeling of relative security

Administration of a relatively small dose of "Immune Globulin (Human) *Lederle*" to the exposed child usually modifies the disease to such a marked extent that the danger of complications is removed Immunity thus conferred by modified measles is active and lasting

In the case of exposed children who are debilitated or weakened by illness, a repetition of the modifying dose is feasible and usually prevents the disease entirely Immunity conferred by this preventive dose is passive and effective for only a few weeks

Through improvement in the method of manufacture, the local irritative and the febrile reactions that were troublesome in 1935 have long since been markedly lessened and their incidence is no longer disturbing

"Immune Globulin (Human) Lederle is available in 2 cc and 10 cc vials

Lederle

NATIONAL

SCARLET FEVER ANTITOXIN

A Real Achievement

Syringes Show Exact Size

Therapeutic Dose — **Prophylactic Dose**

Each package of Antitoxin or Curative Serum (National) contains as illustrated an ampul vial of 1 to 10 dilution of serum to determine sensitivity of the patient by the cutaneous or scratch test

HIGH GLOBULIN CONCENTRATION AND REFINEMENT

Refinement and concentration of the pseudoglobulin fraction of the antitoxin reduces volume 75 per cent, decreases serum reactions, because of low content of non essential serum, proteins, and offers the following advantages

Pain of injection is reduced
Smaller volume is more quickly absorbed
Gives quick therapeutic response

PROPHYLACTIC DOSE

2,000 Units National Institute of Health (100,000 original neutralizing units) in ½ cc volume

THERAPEUTIC DOSE

6,000 Units National Institute of Health (300,000 original neutralizing units) in 1½ cc. volume

Each prophylactic and therapeutic dose contains 30 per cent excess units to insure potency beyond expiration date stamped on each package Furnished in sterile syringes, with rustless (chromium) steel needles and adaptor

The advantages of a highly refined and concentrated Scarlet Fever Antitoxin should materially increase its use for prophylaxis (passive immunity), and for treatment of scarlet fever patients

How the Deaf Hear with
CORONATION ACOUSTICON

This diagram of the ear will help you explain both bone conduction and air conduction to your patients Interestingly colored, it will look very attractive on the wall of your office. We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD, the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE for custom fittings on the Aurogauge and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service.

• HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS, but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye-glasses. Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations. Send us the names and addresses of these "hard to convince" patients. Of course, your name will not be mentioned in our correspondence with them—unless you say so

Why RY-KRISP is a natural corrective for *Common Constipation*

Doctors are finding Ry-Krisp Whole Rye Wafers a natural aid for correcting common constipation due to insufficient bulk because

RY-KRISP is simply whole rye, salt and water — *double baked* for brittle crispness It has a high percentage of bran, high pentosan and crude fibre content to encourage normal bowel action. Each wafer absorbs five times its weight in water, thus producing needed bulk to stimulate natural peristaltic action

RY-KRISP involves no unpleasant dosage. Instead it offers the tempting, crunchy goodness of a *natural,* delicious food — so good with any meal that patients gladly eat it regularly A valuable help to school children, to busy men and women tied down with daily routine.

For free samples and the Research Laboratory Report on Ry-Krisp use the coupon below

When vitality runs low...

A New Complete

VITAMIN-MINERAL THERAPY

Renders Partial Vitamin Treatments Obsolete

CHRONIC fatigue, malnutrition, the general debility of lowered metabolism — how easily these etiologically obscure "run-down" conditions elude accurate diagnosis

Today, thanks largely to the pioneer work of Drs Funk and Dubin, we know that many physiologic disturbances have their origin in faulty eating habits—are due to lack of adequate amounts of vitamins and minerals

In these conditions as in convalescence the immediate objective of the physician must be the upbuilding of vitality—the restoration of metabolic vigor

Today's therapy for these multiple deficiency conditions has its roots in the first discovery by Dr Funk in 1912 of the existence and function of vitamins That startling revelation was the beginning of a brilliant chapter in the modern development of nutritional science.

Determined that the laboratory knowledge of these essential vitamins should be made of practical value to the physician, Dr Funk and his associate Dr Dubin—after long experimentation—finally gave to the world the first commercial concentrate of vitamins A and D in 1923

Today, vitamin therapy has progressed far beyond the A-D concentrate stage—still, however, with Funk and Dubin showing the way For in Vi-Syneral, they have now successfully combined potent concentrates of *all* the known vitamins—A, B_1, B_2 (G), C, D and E—together with eight essential minerals recognizing that the cooperative interrelationship existing between vitamins and minerals requires the presence of both for maximum efficacy

Laboratory research at Columbia University by Dr Walter H Eddy has strikingly demonstrated the superior metabolic stimulus inherent in this multiple vitamin-mineral concentrate, over A-D, A-B-D-G or A-B-C-D-G vitamin preparations

And this showing has been widely confirmed by clinical results reported by thousands of physicians who are using Vi-Syneral so successfully in building up the vitality of the "run-down" or convalescent, and as a protective diet supplement

Vi-Syneral is available in Funk-Dubin balanced potencies for all age groups The usual dosage is one vitamin and one mineral capsule daily, with any meal

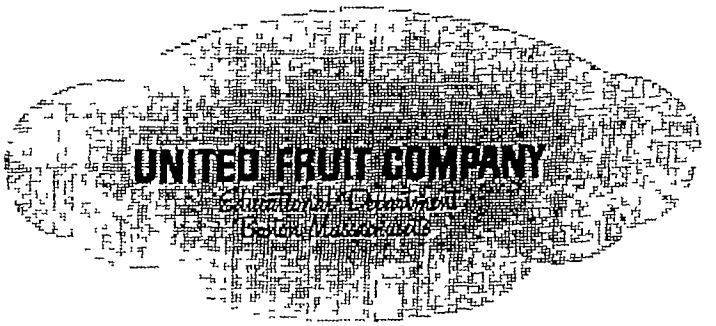
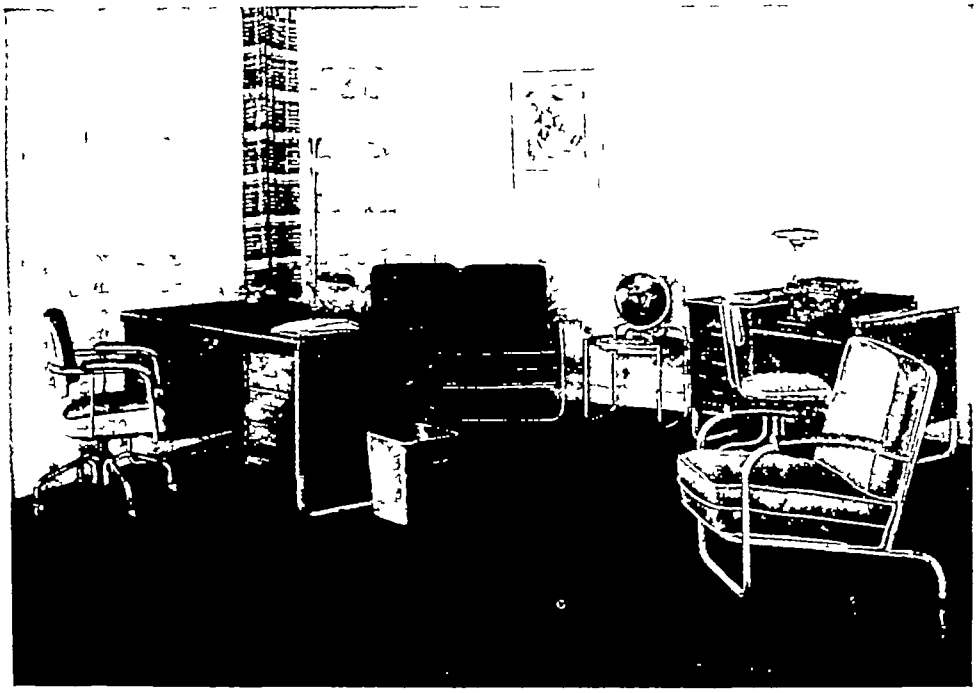
THE REXALL DRUG STORES



RIPE BANANAS are a natural, soft, bland food with a delicate flavor popular with most persons nourishing easily digested non-irritating do not readily ferment in the intestines create intestinal conditions unfavorable to the growth of putrefactive bacteria yield alkaline mineral residues in the body



Because of these attributes, together with their soft fibre, pectins, high content of sugars, satiety value, low content of protein and fat, their vitamins (good source of A-B-C-G) and essential minerals, ripe bananas are prescribed by an increasing number of physicians in many invalid diets, including ulcerative colitis, peptic ulcer, cardiac, diabetes, liver disorders, nephritis, tuberculosis, as well as in various post-operative and convalescent diets

In the field of corrective diets, physicians are finding that ripe bananas help combat diarrhea and spastic constipation, also that in combination with milk they constitute a basis for planning a variety of effective, safe reducing diets for persons who are overweight

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

I. CLEANSING OPERATIONS

● As reference to a recent text on canning will disclose (1) the details of commercial canning procedures will vary from product to product. There are, however, certain basic operations which are included in practically all canning procedures In the belief that they may prove of interest, it is our intention to describe in broad detail the nature and purposes of these essential operations

One of the first and most important steps in commercial canning is the thorough cleansing of the raw food material received at the cannery The purpose of such an operation is, of course, immediately evi dent, namely, to remove soil, dirt or other inedible substances which may be present However, cleaning also serves to reduce substantially the load of spoilage bacteria with which Nature usually endows raw foods

Commercially, cleansing is effected in a variety of ways In general, however, water washers specifically designed for the vari ous types of products are used In these machines, the raw food material is sub jected to high pressure sprays or strong flowing streams of potable water while passing along a moving belt or while being tumbled by agitating or revolving screens Sometimes a "flotation" type of washer is also used to remove chaff or similar material With certain products, water washing is preceded by a "dry" cleaning treatment in which adhering soil and dirt is mechan ically removed from the food by revolving or agitating screens, or by strong air blasts. Also, in certain canning procedures, opera tions whose basic functions are not primar ily to clean the raw material may also exert a cleansing effect. Thus, the "blanch" or scalding treatment accorded many prod ucts serves to clean the food, as does the water spray sometimes applied to foods after the blanch

Modern canners know the necessity of thorough cleansing of the raw materials they use They appreciate that thorough cleaning and removal of extraneous mate rial decreases the load of spoilage organ isms which must be destroyed by the heat processes to which all canned foods are subjected They also appreciate the neces sity of maintaining strict plant and equip ment sanitation to destroy spoilage bacte ria which may be carried in by raw foods.

Because of the efficient cleansing of raw materials and close attention to the other important operations in the commercial canning procedures, modern canned foods must be ranked among the most wholesome foods coming to the American table. (2)

milk

to help lose weight without losing health

Physicians, more than anyone else, know the unscientific diet is likely to bring physical discomfort while it may melt away excess poundage, it is apt to cause the individual to become tired and haggard, perhaps dangerously ill

In its campaign to increase the consumption of milk among adults, New York State is calling attention to the dangers of careless dieting without the guidance of the physician . emphasizing the fact that when caloric intake is decreased, protective foods, such as fruit, greens and milk, *must* be included in the regimen This campaign is attempting to educate people who will or must diet, on the safe and sane way to do it. *The Bureau of Milk Publicity, Albany*

Vol 38 MARCH 1, 1938 No 5

MANAGEMENT OF INTRAOCULAR FOREIGN BODIES

DAVID F GILLETTE, M D, *Syracuse*

The history of an irritated eye sometimes indicates an injury, the details of which may suggest an intraocular foreign body, at times quite evident, but occasionally uncertain The latter needs very careful study

The examiner should always take an exact, searching history [1] This should include the possibility of an injury, the type and manner of work, whether the machines, tools, and metals used are magnetic, and the proximity to and occupation of fellow workmen It is important to get the line of vision, position of the head, and relative height of the working plane, as well as the time of the accident The examiner should also consider the possibility of a second accident, other than that in the line of duty

The oculist must question the patient about pain, loss of vision—whether transitory, gradual or permanent—and any other ocular symptoms, together with his immediate reaction and subsequent treatment He should remember, however, that there may be an absence of pain, and any other subjective symptoms for days, weeks, months, or years following a small puncture wound of the globe

A methodical examination is essential It should include a search for wounds of the lids, especially their margins, of the cornea, conjunctiva, sclera, iris, lens capsule and cortex, together with a careful study of the anterior chamber, vitreous, and all visible portions of the fundus The suspicious case with a meager history requires careful study, for a positive diagnosis is often most difficult

A wound of the lid margin, sometimes only an abrasion in the absence of a direct blow, suggests a flying particle and its position may help to locate the ocular puncture

The wounds of the cornea should be examined very exactly as to depth—this is often helped with fluorescein The examiner should use the loupe, ophthalmoscope and slit lamp,[2] and search for a possible hole in Descemet's membrane, the edges of which have a tendency to retract A shallow anterior chamber in the presence of additional anterior segment trauma strongly suggests a puncture wound, with possible intraocular foreign body If it is impossible to gauge the depth of the corneal wound, and if there is a suspicious trauma, an x-ray is indicated [3] Although it has been claimed that a prolapsed iris contraindicates an intraocular foreign body, it does occur [4] A recently prolapsed iris can often be reduced with the instillation of aminoglaucosin A puncture wound of the bulbar conjunctiva must be studied with care, especially if a hemorrhage is present It is sometimes possible to expose the scleral wound by blanching the conjunctiva with an adrenalin pack The examiner should not probe the conjunctival wound in search of a scleral puncture,[5] for it may further traumatize the vitreous, introduce infection, or cause a secondary hemorrhage

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

The scleral puncture is usually evidenced as a dark line of uveal pigment, or as a clear transparent ridge or bead of vitreous with a white scleral border A puncture wound of the sclera is usually accompanied by hypotony

A hole in the iris may be seen in direct light, but is best revealed by transillumination This can be quickly done at the time of slit lamp and ophthalmoscopic examination, and should always be completed before the pupil is dilated A foreign body imbedded in the iris, either anteriorly or posteriorly, may be hidden by hemorrhage or exudate

When free in the anterior chamber a foreign body will either be anterior in the iris angle, or posterior between the root of the iris and the zonula ciliaris The tug of a small permanent magnet will help to locate such a magnetic foreign body The hand or giant magnet should not be used for this purpose, as the foreign body may become hopelessly entangled in the iris, necessitating an iridectomy at operation This should always be avoided whenever possible, both for cosmetic and visual reasons

The pupillary area of the anterior lens capsule and as much of the cortex as possible should be minutely examined with the ophthalmoscope and slit lamp The examiner should, when possible, dilate the pupil and repeat the examination to the periphery of the lens and fundus

The reaction of the ocular tissues to the trauma depends upon the physical condition of the patient and the eye at the time of the accident, as well as the size, shape, speed, and nature of the flying particle If the foreign body is small and of high speed, the small capsule wound of the lens usually closes immediately, leaving but little opacity However, when aqueous freely enters the lens wound, the cortex becomes opaque and swells, often so rapidly that glaucoma results

The ophthalmologist should use the slit lamp and ophthalmoscope to search the vitreous for the foreign body and its path The latter is usually evidenced immediately by some uveal pigment or blood, and later by a grey streak,[6] which appears soon after the vitreous lamellae have been injured Later this path often becomes filled with fibrous bands that may lead eventually to destruction of the eye.[7] The foreign body may be free in the dependent portion of the vitreous, or located in the retina, where it is usually obscured by hemorrhage If the eye is not too severely traumatized and there is no danger of emptying the anterior chamber, the tension should be taken, preferably with a tonometer However, when a limbal section is indicated, it is best to conserve the anterior chamber, for it simplifies the operation and lessens the possibility of trauma to the iris and lens

Sooner or later most retained particles of iron or steel cause siderosis This is evidenced by the ocher-colored pigment deposited about the metal on Descemet's membrane, the lens capsule, and in the vitreous Other symptoms—dilated pupil, defective color perception, and macular disease—appear later

Retained intraocular copper particles cause a chemical degeneration known as chalcosis, which is shown by the rosette-shaped collections of crystals beneath the posterior lens-capsule and the Kayser Fleischer stain in the cornea

Retained foreign particles are always dangerous and usually lead to degenerative pyogenic or chemical changes that result in blindness [8]

The magnet is an important aid in the diagnosis of a magnetic intraocular foreign body [3 4 9] The location of the foreign body should be known, if possible, before this test is made It is best to approach the eye with a dead magnet and when ready turn on just sufficient current to produce a slight pull and its resultant pain When the foreign body is in the anterior chamber, the effect is also objective

The x-ray is another valuable asset in diagnosis[3] and should be used in all questionable cases—those of long-standing, those in which response to the magnet has failed, and if desired, in any case to confirm the diagnosis A single negative x-ray does not prove the absence of a foreign body, for it may be either radiolucent or small enough to escape detection In suspicious cases the negative findings should always be checked from several angles and distances, to lessen the possibility of an error, which even then may occur [3 4] The x-ray may be

used routinely.[1] The sideroscope has been recommended as a diagnostic help of great value.[8]

The examiner should note every evidence of former pathology in either eye, record the visual acuity of each eye,[2] and note the presence of a tropia or field defect.

The magnet should be sufficiently powerful to pull a small magnetic particle through the vitreous and zonula ciliaris. The surgeon has a precedent for any strength of magnet, from the powerful giant,[10] and weaker hand,[4 6 11] to the small permanent magnet.[4] I prefer to use the hand magnet with a rheostat attachment, since both the direction and strength of its pull are readily controlled. It can be improved by inserting a foot switch that can be operated by the surgeon. The blunt cone-shaped tip is best.[6 11]

In every suspicious case of intraocular foreign body, an early diagnosis should be made, if at all possible. Then the operator should determine the time and type of procedure. The surgeon again has a precedent for any form of treatment he may wish to follow, from watchful waiting[2 12 14] to immediate extraction.[3 4] The shorter the interval following the injury, the easier the extraction.[3] This can be done either by the anterior or posterior route, through the original wound or a section.[3 4 9 15-17] The entrance wound, nature of the trauma, and the size, shape and location of the foreign body should determine the route of operation.[1 2 11 18 19]

The anterior route with a limbal section permits the immediate delivery of the traumatic cataract. This is often advisable for it may prevent undue reaction, secondary glaucoma due to swollen cortex, and shorten the period of convalescence.

When the foreign body is in the lens, the operator should try to pull it through the capsule wound into the anterior chamber. If this is unsuccessful, allow it to remain until the lens becomes opaque or siderosis develops, then both the lens and its contained foreign particle should be extracted. This latter procedure is quite safe since the albuminous lens matter is very tolerant of a foreign particle.[8] A small hypopyon with little or no reaction is not a contraindication to operation,[4] for it may be chemical rather than a pyogenic reaction.[8]

When he has decided on the method of operation, the surgeon should have everything in readiness for any eventuality before proceeding. The type of anesthesia is determined by the case.

He should never approach the eye with a live magnet.[6] It is safer to get it placed, turn on the current very gradually, and hold it as soon as a response is noted. If the foreign body is not readily moved, it may be dislodged by turning the current on and off.

The surgeon should plan to suture the wound when necessary, and always cover it with a conjunctival flap.[4]

In the cases presented, the anterior route was used in all anterior cases and attempted in all that showed trauma of the anterior segment, in many the extraction was made through the entrance wound. When this failed, for the posterior cases a conjunctival flap was prepared and the posterior route attempted as close to the foreign body as possible, but usually between the external and inferior recti muscles. The section was posterior and at a right angle to the ciliary process and just long enough to emit the foreign body. The crucial section was not made, although on several occasions it was necessary to enlarge the scleral wound to permit the removal of a large particle. The scleral wound was touched with iodine following the delivery.

The operator should never plunge a knife into the vitreous body,[6] but should make a careful scleral section—e.g., for a cyclodialysis, but in this case either at a right angle or parallel[4] to the orra serrata. There are several useful knives adapted to the purpose.[4 6]

If the foreign body has not been removed, it is well to again x-ray for a possible movement, and repeat the procedure within safe limits, to avoid overexposure to radiation. When this has failed, the operator may as a last resort insert a small magnet tip into the scleral wound.

After the removal of the foreign body by the posterior route, some method for the sealing of the retinal hole should be attempted. Iodine and phenol[6] cauterization have been used successfully.

The scleral puncture is usually evidenced as a dark line of uveal pigment, or as a clear transparent ridge or bead of vitreous with a white scleral border A puncture wound of the sclera is usually accompanied by hypotony

A hole in the iris may be seen in direct light, but is best revealed by transillumination This can be quickly done at the time of slit lamp and ophthalmoscopic examination, and should always be completed before the pupil is dilated A foreign body imbedded in the iris, either anteriorly or posteriorly, may be hidden by hemorrhage or exudate

When free in the anterior chamber a foreign body will either be anterior in the iris angle, or posterior between the root of the iris and the zonula ciliaris The tug of a small permanent magnet will help to locate such a magnetic foreign body The hand or giant magnet should not be used for this purpose, as the foreign body may become hopelessly entangled in the iris, necessitating an iridectomy at operation This should always be avoided whenever possible, both for cosmetic and visual reasons.

The pupillary area of the anterior lens capsule and as much of the cortex as possible should be minutely examined with the ophthalmoscope and slit lamp The examiner should, when possible, dilate the pupil and repeat the examination to the periphery of the lens and fundus

The reaction of the ocular tissues to the trauma depends upon the physical condition of the patient and the eye at the time of the accident, as well as the size, shape, speed, and nature of the flying particle If the foreign body is small and of high speed, the small capsule wound of the lens usually closes immediately, leaving but little opacity However, when aqueous freely enters the lens wound, the cortex becomes opaque and swells, often so rapidly that glaucoma results

The ophthalmologist should use the slit lamp and ophthalmoscope to search the vitreous for the foreign body and its path The latter is usually evidenced immediately by some uveal pigment or blood, and later by a grey streak,[6] which appears soon after the vitreous lamellae have been injured Later this path often becomes filled with fibrous bands that may lead eventually to destruction of the eye.[7] The foreign body may be free in the dependent portion of the vitreous, or located in the retina, where it is usually obscured by hemorrhage. If the eye is not too severely traumatized and there is no danger of emptying the anterior chamber, the tension should be taken, preferably with a tonometer However, when a limbal section is indicated, it is best to conserve the anterior chamber, for it simplifies the operation and lessens the possibility of trauma to the iris and lens

Sooner or later most retained particles of iron or steel cause siderosis This is evidenced by the ocher-colored pigment deposited about the metal on Descemet's membrane, the lens capsule, and in the vitreous Other symptoms—dilated pupil, defective color perception, and macular disease—appear later

Retained intraocular copper particles cause a chemical degeneration known as chalcosis, which is shown by the rosette-shaped collections of crystals beneath the posterior lens-capsule and the Kayser-Fleischer stain in the cornea

Retained foreign particles are always dangerous and usually lead to degenerative pyogenic or chemical changes that result in blindness [8]

The magnet is an important aid in the diagnosis of a magnetic intraocular foreign body [8 4 9] The location of the foreign body should be known, if possible, before this test is made It is best to approach the eye with a dead magnet and when ready turn on just sufficient current to produce a slight pull and its resultant pain When the foreign body is in the anterior chamber, the effect is also objective

The x-ray is another valuable asset in diagnosis[3] and should be used in all questionable cases—those of long-standing, those in which response to the magnet has failed, and if desired, in any case to confirm the diagnosis A single negative x-ray does not prove the absence of a foreign body, for it may be either radiolucent or small enough to escape detection In suspicious cases the negative findings should always be checked from several angles and distances, to lessen the possibility of an error, which even then may occur [3 4] The x-ray may be

The diathermy point or galvanocautery may be as effective

The scleral wound should be sutured, if necessary, and always protected by a conjunctival flap The patient should be kept quiet in bed until the danger of secondary hemorrhage and early detachment have passed The patient should, after proper precautions, receive an immunizing dose of tetanus antitoxin [2 6] In the case of children it can be given during anesthesia If the operator wishes a foreign protein,[6] he should await the early effect of the antitoxin, which may act in this capacity

The surgeon has a precedent for any position of the patient during the operation [4 6] The rigid mounting of the large magnet makes it imperative to adapt the patient to it, while the hand magnet can be adjusted to the position of the patient and direction of pull desired The exceptional case needs the added strength of the giant magnet, which must always be used with great care.[15] It would be well to mount the giant magnet on a wall bracket similar to that formerly used for the dental motor, thus making it applicable to any position With the patient flat on his back, the vitreous is most dependent, the patient more at ease, and the operative field most convenient

The patient should not be moved about immediately following the operation, hence the advisability of the supine position and the use of the ophthalmic bed, as in other major eye surgery When the patient is in a sitting position the direction of the magnet pull cannot be as accurately controlled and the danger of vitreous prolapse and detachment are greater It is debatable whether the detachment of the retina is due to new formed tissue strands or the retinal hole

The surgeon should use as little trauma as possible, for although the extraction of the foreign body is dramatically satisfying, he must remember that the accident may have caused such damage that an added insult will cause a slow degenerative process that leads to destruction of the eye Although sympathetic ophthalmia is rare[2] and does not occur in the absence of infection,[7] and possibly not often following the early administration of tetanus antitoxin,[2] the operator should explain to the patient and his family its possibility and acquaint them with the prodromal symptoms

The patient should be seen at regular intervals over a period of years, for his own protection, and to correctly determine the end results, for many intraocular foreign bodies are followed by late detachment of the retina, phthisis bulbi, and blindness

The failure in extraction is usually due to the foreign body being non- or too-weakly magnetic, too firmly fixed with exudate, hemorrhage or scar tissue, or the result of a "double perforation"

The examiner should keep an exact detailed record of his findings, and augment this throughout the progress of the case with accurate notes to make the case history complete

The accompanying tables present an analysis of seventy-five of the cases of intraocular foreign bodies treated in my practice

Case Reports

CASE 4 Master D B lacerated the cornea from limbus to limbus while playing with a button strung on a loop of string, and used as a "buzz-saw" His oculist advised, but was refused, enucleation

Five months later the boy presented at the clinic with a soft, blind, irritated eye, at which time enucleation was again advised The father then returned the boy to his oculist, watched the operation, and when inspecting the eye found that a large piece of the button occupied the shrunken vitreous chamber

A malpractice suit, instituted because an x-ray had not been taken at the time of injury, was "non-suited."

CASE 7 C G had an "explosion" or "back-fire" from a toy pistol while shooting .22 blank cartridges

The examination showed a laceration of the right cornea, and the anterior chamber filled with blood-stained vitreous and cortex Vision was nil X-ray showed the blank cartridge shell in the vitreous chamber The eye was enucleated

CASE 9 The foreign body in the vitreous was removed, the eye remained irritated three weeks, then became quiet and had remained so when seen by me three months later

Five years later the patient presented to a fellow oculist with a uveitis of the second eye

The patient was then referred to me because of the question of sympathetic oph-

CASE 25 Six months prior to consulting me this patient had been treated for an ulcer of the cornea and secondary iritis following an injury received while "setting" a nail

The slit lamp revealed the scar of a puncture wound of the cornea, iris, and lens, with a tract of vitreous opacities

The x-ray was positive for foreign body in the vitreous

The foreign body was removed through the sclera, following an unsuccessful attempt by the anterior route

The eye reacted very little, and the vision has remained 20/25

CASE 28 N C had a wound of the left cornea, extending from five to seven o'clock of the limbus The prolapsed iris was covered with a fibrous exudate A broad iridectomy was performed, and the foreign body removed by the anterior route The wound healed without incident. Vision with correction is 20/20

CASE 35 D M injured the right eye while striking two pieces of iron together

The entrance wound was just above the pupil, through the iris and lens, resulting in a traumatic cataract.

Although a small hypopyon was present, extraction was performed by the posterior route. The wound healed—the anterior chamber cleared—and a descission was performed later

The eye has remained quiet since.

CASE 37 L. N had a penetrating wound of the cornea and lens, a path in the vitreous, and a retinal hemorrhage nasally and below

The radiologist reported a foreign body located well back in the globe

Magnet was unsuccessful Later x-rays with movement of the globe showed foreign body to be located behind the eyeball Injury was a double perforation of the globe. This is apparent after absorption of the blood and healing of the wounds

CASE 42 P M presented to me, in the absence of his oculist, soon after being struck by a spicule of steel, which had penetrated the cornea 1½ mm central to the limbus at eight o'clock, and reached from the posterior one-third of the corneal wound, through the iris into the anterior lens

The foreign body was removed through the wound with a small permanent magnet, the wound protected with a conjunctival flap, and the patient referred to his oculist the following morning

The eye did not become quiet although there was no evidence of infection or complications directly attributal to the evident trauma.

An x-ray showed a second smaller foreign body in the vitreous There was only the one visible puncture wound of the globe. Following the removal of the second foreign body the eye became white, vision returned to normal and has remained so since

CASE 44 G O got a foreign body "on the cornea," while hammering on metal This he claims was immediately removed by a fellow workman Twenty-four hours later the eye became red and irritated. Forty-eight hours after the injury he presented with a superficial corneal ulcer and iritis

The x-ray, magnet, and objective examinations were negative for an intraocular foreign body or its path The ulcer healed, eye became quiet, and patient was discharged in three weeks with clear mediae and vision of 20/20 Siderosis developed after fifteen months and patient lost the eye.

I believe there was a second injury, known or unknown, to the patient.

CASE 66 A small foreign body that had become imbedded in the iris was removed through the entrance wound A small thread-like anterior synechia remained attached to the posterior lip The eye remained irritated until this was sectioned at the cornea The eye quickly became quiet and has remained so for past eighteen years Vision 20/30

CASE 74 C H suffered a scleral puncture wound of the right eye in an "explosion in a radio set" Ophthalmoscopic examination was suspicious for foreign body in vitreous

The x-ray and magnet were negative. The patient later had the other eye so lacerated by a "lion" that it had to be enucleated The primarily injured eye now shows beginning chalcosis, especially evidenced on the cortical surface of the posterior lens capsule. Vision 20/20 Vitreous opacities

Conclusions

1 Most intraocular foreign bodies result from hammering

2 Most of these foreign bodies pierce through the outer zone of the cornea

3 The magnet and x-ray are invaluable aids to diagnosis, and should aid in choice of the route

4 A good hand magnet with rheostat is usually sufficient, as it is readily controlled

5 The route of operation depends on

thalmia There was a mild uveitis, the pupil was active, the blind spot normal, and the injured eye had given no trouble. My diagnosis was a uveitis, not sympathetic ophthalmia

His oculist reported that the uveitis subsided within four weeks

CASE 10 J G gave a history of immediate permanent blindness following a painful injury to the eye while pounding a "bar of steel" He also noted some bleeding from the eye Extensive intraocular hemorrhage occurred with a prolapse of iris, lens, and vitreous through the corneal wound. Patient refused immediate enucleation

The x-ray showed a foreign body, but so far posterior that it was questionable if in the eye. An attempted extraction with the hand magnet was unsuccessful

At enucleation two days later, the foreign body was found to have penetrated well into the optic nerve, at the center of the disc

An analysis of the steel showed it to be other than that used in regular employment The patient subsequently admitted that the injury was received while repairing his car

three days he was fairly quiet although was of course under a great emotional strain. On April 16, he visited his wife's bier although he did not attend the funeral A week later he was discharged from the hospital. He returned to work in thirty-four days His vision corrected to normal with lenses and now over two years following operation the eye is quiet and vision normal with correction.

This is by way of illustration to show how differently patients are influenced by their environment in a small community

DR ARTHUR J BEDELL, *Albany*—Dr Gillette's paper is appropriate for it again opens the subject of the proper handling of patients who have magnetic intraocular foreign bodies He has clearly stated his methods, and the other discussers have recorded their experiences

It seems to me that the whole problem is divided into three distinct parts, each of which is important, for the end result depends upon the accurate correlation of all three

1 The exact localization and record of the size and shape of the foreign body
2 The use of the correct magnetic force.
3 The proper understanding of the mechanical principles underlying the removal of the foreign body

The localization must be done by a competent radiologist, who will not only tell the position of the body, but also its size and shape I believe that the Sweet method of localization is best.

The magnet must have sufficient pulling power to attract the foreign body within the globe, even if it is enclosed in exudate Except in extremely rare cases, the posterior route should be avoided I have come to this conclusion after many years of observation of my cases and those of others

The first foreign ophthalmologist I ever met was the renowned Haab of Zurich, when he visited Philadelphia in 1902 Four years later it was my good fortune to spend some time with him and to be shown his extensive collection of foreign bodies and the objects from which they came. His method was excellent in his hands but for many reasons—I now believe, mainly because my magnets were too weak—I failed to draw the foreign body into the anterior chamber and I had to open the globe Unfortunately some detachments followed rather brilliant operations

To succeed by the anterior route the magnet must have reserve power I do not believe that any of the ordinary magnets on the market have sufficient strength to withdraw small embedded intraocular foreign bodies I have a special magnet which is most powerful and so delicately balanced that it can be easily controlled

The magnet must be so manipulated that serious damage to the eyeball is avoided and this cannot be done without a very complete and thorough understanding of magnetic forces I further believe that unless one has an extremely powerful magnet he is not fair to the patient when he attempts removal and causes excessive damage before the case is sent elsewhere.

To summarize, I believe that a foreign body should be exactly localized, the magnet should be of the most powerful type and manipulated with the greatest skill

Nonmagnetic foreign bodies call for the closest association of radiologist and ophthalmologist The Cross method is to be preferred

DR HAROLD H. JOY, *Syracuse*—As Dr Gillette has stated there is, as a rule, little danger of sympathetic ophthalmia occurring as the result of an intraocular foreign body Of nearly 1500 cases of intraocular foreign bodies which have been reported in the literature in the past few years sympathetic involvement occurred in only four The hazard is probably no greater than that following other types of accidental perforating wounds This incidence has been estimated all the way from 08 to as high as five per cent

While every effort should be made to remove promptly an intraocular foreign body, its presence does not necessarily add to the danger of sympathetic ophthalmia Of the cases reported by Duggan and others, foreign bodies had been retained for as long as twenty years without involvement of the fellow eye

A foreign body is only an agent of infection as is any other penetrating object. If it is septic the infection has already been introduced regardless of its extraction, while if it is aseptic it may remain quietly in the globe for years Even if siderosis occurs, it does not add to the danger of sympathetic ophthalmia While there may be the theoretical consideration that a retained foreign body may sometimes act as a secondary focus of infection, such a condition if it ever occurs, must be exceedingly rare

On the other hand the removal of a retained foreign body is not without danger, for the operation is occasionally followed by sympathetic inflammation. There was one such case in the series which I reported to this Society two years ago

If a foreign body has been present for a long time and if the eye remains quiet, the danger of removing the foreign body may overbalance the danger of leaving well enough alone.

the entrance wound—the trauma and the size, shape, and location of the foreign body

6 Exact history, careful examination and complete records are essential

Discussion

DR M H NEWTON, *Little Falls*—After reviewing the paper written by Dr Gillette, there appears little that I can add other than my appreciation for such exacting data and the opportunity in appearing on the program with such capable teachers

The management of an intraocular foreign body case presents very little difference in the small community in which I live than in a larger medical center There is, however, this exception We take our own x-rays and are dependent on our own interpretation of pictures All suspicious cases are rayed and if a foreign body is found a stereo is made with a double exposure plate with rotation of the eyeball in the long axis of the body to determine whether the foreign body is in or outside the globe If, after this procedure, the foreign body is proven to be intraocular, the patient is referred to the nearest localization x-ray—twenty-two miles distant

Another difference in a smaller community presents itself in the fact that nearly everyone knows or knows of everyone else and this social relationship must not interfere with professional and scientific judgment In other words, the sense of triumph for the individual patient and the doctor at a successful delivery of an intraocular foreign body, as though that dramatic event signalized the end instead of the beginning of a long drawn-out struggle against slow degenerative processes, should not overshadow the conservative and detailed preliminary examination and aftercare which Dr Gillette stresses In this same community, where the public at large is cognizant of all details, the surgeon who allows an eye to degenerate without attempting the removal of the offending foreign body subjects himself to severe criticism With all these factors in mind, I am the more impressed with Dr Gillette's admonition that in attempting a removal a prompt, dexterous, and efficient technic must be followed, with the minimum of added trauma so that the damage already done by the entrance of a foreign body is not increased by its emergence.

Dr Gillette's reference to the aftercare and my own reference to our community life reminded me of the following case incident which I shall, with your permission, very briefly mention

On April 9, 1935, W H.F, aged thirty-five, came to my office with the history that ten minutes previously while striking steel with a hammer a foreign body flew in the left eye. The vision, when I first saw this man was 20/30 O U uncorrected. The foreign body could be seen with the ophthalmoscope to the nasal side of the nerve head This patient was referred immediately to the Hospital where ice packs were to be employed but the patient insisted on first going home to see his wife who was that day threatened with pneumonia That same night a vain attempt was made with the hand magnet to remove the foreign body through a scleral incision well back between the internal and inferior recti The following day, the patient was referred twenty-two miles distant for a localization Again the patient insisted on visiting his wife before returning to the Hospital That night an unsuccessful attempt was made to remove the offending body with a giant magnet. At each operative procedure the eye was a little traumatized and no effort was made to introduce the magnet tip into the wound The following day (April 11) at the insistence of patient's employers, patient was taken to Schenectady, a distance of sixty miles where they (the employers) knew the foreign body could be removed, but at the General Electric Hospital further interference was denied Patient again visited his wife on his return to Little Falls Two days later patient's wife was brought into the Hospital moribund and died a few hours after admittance Patient at any cost insisted on seeing his wife this day During the next

daily dosages of androgens Reddening of the circumgenital skin and development of the genitalia of both males and females[4] was observed, but the onset was not necessarily concomitant with the earliest appearance of nasal phenomena Increased vaginal secretion was seen in the females but smears revealed no definite changes in vaginal cell types

In monkeys receiving injections three X weekly, no nasal changes were observed for a longer period They appeared first after doses of four mgm, later in one animal receiving one mgm It failed to appear in three weeks in animals receiving $\frac{1}{16}$ mgm or less It is well to remember in any quantitive measurement of response that the condition of the animal is a significant factor The monkey quarters used in the experiments are small, so that several shipments of animals were used at different times, hence, the monkeys may well have varied in their capacity to

TABLE I

Group	Animals	Hormone
1 (a)	3 Males 2 Females	3–15 mg testosteroneacetate or propionate daily for 21 days
(b)	5 Males 1 Female	Doses graded from 1/64 mg to 4 mg given 1–3 X weekly
2	1 Female	15 mgm testosterotone propionate and ketohydroxyoestrin* 10 000 international units
3	6 Males 4 Females	Control

* Theelin supplied through the courtesy of Parke Davis & Co

respond to the hormones Nevertheless, it appeared definite that there was a longer latent period in the appearance of nasal changes when smaller dosages or infrequent administration were employed

Histologically, congestion and, in particular, perivascular edema were the most striking changes Although considerable moisture was encountered during nasal inspection of the injected monkeys when they were alive, definite growth changes in the mucous glands were not ascertained It may be possible that the increased liquid material observed in the living state was in part associated with the congestion and edema of this region

Humans· As in monkeys, swelling and congestion of the turbinates were obvious in the humans Perhaps the redness was an even deeper color

Histological studies of the humans were not done

Discussion

Medical workers have long been interested in the specialized areas of nasal passages where vicarious menstruation and changes in pregnancy have been observed A definite relationship between the function of these regions and the presence of the *female* sex hormone has been conclusively shown by Mortimer and coworkers. The present data demonstrate that *male* hormone substances *also* influences the state of this region, both in the female as well as in the male monkey and in the human male Possibly clinical treatment of underdevelopment or hypofunction of this nasal region with hormonal substances may be of use The twenty-seven-year old hypopituitary case exhibited pronounced nasal response At present androgenic substances are being employed in the study of atrophic rhinitis Caution should be observed, however, in the use of androgenic substances in females, for they exert a direct masculinizing action, particularly upon homologues of those organs which in the male respond to male substances This is especially marked in the development of Skene's ducts into prostatic type of organ[5] and the clitoris into a penile-like structure[6]

The narrowing, congestion, and mucous secretion of the nasal passageway is significant in regard to warming of inspired air and in infectious processes It is well-known that there is normally a sheet of mucous material which is continually passed back by ciliary action to the pharynx and emphasis is laid upon the importance of this in preventing continued lodging of material on nasal areas It would seem worthwhile to study the effect of gonadal hormones upon the formation and movement of this nasal sheet.

It is worthy of note that Hartman[7] has been unable to produce nasal changes in rodents with estrogens, although such phenomena can be obtained in primates There seems to be species difference and the question might be raised as to additional presence of menstrual endometrial tissue in animals which have nasal changes

MALE HORMONE

Effect Upon the Nasal Mucosa of Man and Monkey

HARRY K TEBBUTT, M D, *Albany*

Until a comparatively recent period the field of endocrinology was far from adequately understood However, within the past few years a great deal of valuable scientific work has been accomplished The volume, however, is far too great to be referred to in this paper

There is one reference, however, which should be mentioned, that is the work done by Mortimer and his coworkers of Montreal They showed that the injection of a female hormone into a group of monkeys caused reddening and sometimes swelling of the superior and inferior turbinates

Several years ago, Dr James B Hamilton of Yale University, came to the Albany Medical College, Union University, to continue his studies in endocrinology Among the various problems he has been working on was the action of male hormones in the treatment of cryptorchidism This work was carried on with funds from various sources and with male hormone supplied by the Ciba Company of Basel, Switzerland This substance is unique in that it is the first time that it has been produced synthetically in quantities sufficient to conduct extensive experiments

Being familiar with the work of Mortimer, the question arose as to whether this male hormone would produce similar changes in the nasal mucosa The material in this paper will be confined to this phase of the problem

Materials and Methods

Animals Twenty-two immature rhesus monkeys, weighing from 1 2 to 2 2 kilograms, were selected and divided into three groups (Table I)

All injections were given in one c c. of peanut oil, since the amount and the type of oil are known to influence the effect of the hormone [5]

For nasal inspection an assistant entered the animal cages, selected each monkey in turn and held the animal against the mesh wire of the cage in such a manner that the face fitted snugly in an opening in the mesh Thus, with only moderate excitement of the monkeys, three observers who remained outside the cage, were enabled to examine the animals, without knowledge aforehand of the monkey's identity

With a small otoscope, study was made of the nasal cavity with reference to the amount of congestion, swelling, and secretion After examination of the nasal cavity, inspection was made of the sex skin and genital organs for comparison with nasal changes Injection was given at completion of the observations Drawings in color were made by an unprejudiced artist unacquainted with the problem

To understand the nasal regions exhibiting changes it is necessary to appreciate the anatomy of the nasal chamber of the monkey, especially with regard to the manner in which it differs from that of the human

Humans Nasal inspection was done on a group of boys and men who were receiving testosterone propionate for various conditions, e g, cryptorchidism, impotence (absence of penile erection), hypogonadism, and acne In this group are five boys ranging from eighteen months to fifteen years, a twenty-seven and a forty-three year old man Drawings in color were made as in the monkeys

Results

After a week or more, marked increase in the congestion, swelling, and secretion was seen in the animals receiving massive

I wish to acknowledge the valuable assistance given us by Dr Arnold F Judge, of Albany, who has recently been bearing an equal share of this burden

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

EXTRAOTITIC MENINGEAL SYNDROMES

Differential Diagnosis

E D FRIEDMAN, M D, *New York City*

Professor of Neurology, New York University College of Medicine, Visiting Neurologist, Bellevue Hospital, and Senior Attending Physician, Neuropsychiatric Service, Beth Israel Hospital

Extraotitic meningitis may be encountered during the course of any severe infection and may occur in many forms of intoxication (meningismus) It may be purulent or nonpurulent

Among the nonpurulent forms, tuberculosis meningitis is the most important It usually occurs in children but may also be met with in adults For weeks before the acute syndrome becomes manifest, there is noted a change in the mood and attitude of the patients Children cease to play, complain of pain in the legs, sit quietly by themselves, and occasionally complain of headache, they show impairment of appetite, nausea with occasional vomiting, and drowsiness In such cases a diagnosis of gastric disturbance is frequently made After a short prodromal period there is a sudden outburst of meningeal signs and symptoms, some exhibit the hydrocephalic cry which wakes the child from sleep

Children with vague digestive disturbances and alterations of mood should not be considered cases of primary acidosis but this grouping of symptoms should arouse the suspicion of tuberculous meningitis There is usually an irregular fever, and the march of events continues rapidly, with death in about three weeks

The meningitic lesion is most pronounced at the base, hence the frequency of ocular palsies The exudate follows the fissures and pial vessels The pathological changes may be part of a general miliary process (hence the importance of x-ray examination of the chest) or may occur as an apparently primary process following an old tuberculoma of the brain There may be tuberculous foci in the glands, in the bones, kidneys or lungs, at times, one observes tuberculides in the skin

Cases of tuberculous meningitis have been described in children who have been exposed to a tuberculous servant in the home I recall such an instance in my own practice.

In the early stages, we find a slow, irregular pulse, and other evidences of vagus irritation The white cell count usually shows a leukopenia with a tendency to polynucleosis At times there may be a moderate leukocytosis Occasionally, the exudate in tuberculous meningitis is purulent (in the rapidly fatal cases), but in most instances the spinal fluid is clear and under increased pressure, the protein content is increased, there is a pleocytosis, consisting chiefly of lymphocytes A coagulum forms in the form of a fine filament in which the tubercle bacilli can frequently be demonstrated The sugar content falls and the figure for chlorides is below 600 There may be a positive tryptophan reaction

The deep reflexes are usually diminished, this is especially true of the knee jerks Frequently there is retention of urine In very young infants we may find a tense fontanelle Tubercles may occasionally be seen in the choroid

The most common pyogenic form of extraotitic meningitis is the epidemic form This usually comes on acutely, with chills, fever, and vomiting The spinal fluid is characteristic (cloudy, purulent, and containing gram-negative organisms) In the septic cases the blood culture may be positive. These may run their course without meningeal signs In some cases the spinal fluid does not show the bacteria early in the disease It is important to remember that cultures may be sterile if the fluid is cooled in transportation

In most cases of meningococcus meningitis there is first an upper respiratory catarrh Later, there follows a blood stream infection and finally, meningitis supervenes

The clinical picture of epidemic meningitis is differentiated from the tuberculous

Read in abstract at the meeting of the Section of Oto-laryngology, New York Academy of Medicine, April 21, 1937

Summary

1 In twelve monkeys and seven humans, testosterone acetate and propionate effected changes on specialized nasal areas

2 These changes produced by androgens occurred in both male and female monkeys Grossly congested swelling and fluid formation were observed Histologically, perivascular edema was pronounced

3 The nasal areas affected are similar to those which exhibit vicarious menstruation Discussion is given as to possible physiological significance in warming of inspired air and in prevention of infection, and therapeutic use in conditions of undervelopment and hyposecretion

Discussion

DR. D'ARCY MCGREGOR, *Buffalo*—I feel highly honored but somewhat bewildered at the responsibility of attempting to discuss such a technical paper as the one which Dr Tebbutt has just presented Since this paper offers a virtually new avenue of therapy in our specialty, I believe it deserves careful consideration

A survey of the literature available to me would indicate that the physiologic relationship between the nose and sexual apparatus has been recognized for a long time The periodic engorgement of the nasal mucosa coincident to menstruation first attracted attention It was noted that these changes were most consistently seen in certain definitely localized areas and the term "genital spots" was employed to describe them

Stimulation of these genital points caused reflex changes in the sexual organs although no definite nervous pathway could be traced which might explain the course of the reflex action

At the same time, it was noted that reflex phenomena—sneezing or coryza—were frequently associated with coitus and menstruation

Thus it was apparent that since intranasal disturbances resulted from stimuli originating in the reproductive system it was quite possible that the reciprocal relationship might establish a logical basis for assuming that certain derangements of the sexual function might be treated intranasally

The most practical application of these early theories was in the study and treatment of dysmenorrhea Rhinologists at the insistence of gynecologists cauterized the genital spots with trichloracetic acid and the actual cautery or applied anesthetics such as cocaine, apparently in an effort to disrupt the reflex pathway

Opinions as to the efficacy of this treatment varied widely, some observers were convinced that their results were consistently satisfactory, others could see no virtue in it, while a third group reported that in selected cases some relief might be expected

Under these circumstances it was not to be wondered at that interest in the subject waned from lack of enthusiasm

In a recent paper Mortimer, Wright, and Collip sum up the situation in the following paragraph "Since 1912 the literature on Naso-Genital relationship has been slight, and for the most part consists of case reports of nasal dysmenorrhoea, vicarious bleeding from the nose, etc. It would appear that the nasal treatment of dysmenorrhea is much less in vogue today and that the nature of the physiological relationship between the sex organs and the nose has become a problem of diminished interest"

Recently there has appeared to be a revival of interest in this subject and approaching the problem from the point of view that the activities might be due to the influence of hormones the literature again begins to contain many references. The Journals of Endocrinology carry articles on the intranasal administration of pituitrin particularly for diabetes insipidus and for the induction of labor, describing the method as efficient, easy, and safe

Dr Tebbutt reports that after administering hormones for varying periods the nasal mucous membranes showed very definite changes characterized generally by thickening and increased vascularity

It may well be that this is the type of research that will provide the answer to many of the perplexing problems of our particular field and Dr Tebbutt is to be congratulated upon the energy and initiative he has shown in undertaking this study

brain which were accompanied by a low grade purulent meningitis

Occasionally we encounter instances of so-called cerebral poliomyelitis without frank evidence of spinal involvement. These cases constitute the so-called meningitic forms of infantile paralysis

Meningitis may at times be simulated by encephalitis, either primary or secondary to the exanthemata In these cases the meningeal signs are usually less pronounced The protein content of the spinal fluid is very little above the normal, the pleocytosis is not very marked, and the sugar content usually remains at or near the normal figure (at times it may be elevated above the normal) There are also the evidences of a far-flung infection in the central nervous system with phenomena referable to the midbrain, the basal ganglia, and the nerve roots

Subarachnoid hemorrhage may occur during the course of arteriosclerosis and hypertension, subacute endocarditis (with the incidence of a mycotic aneurysm in the brain) or on the basis of a congenital anomaly in the vessels of the circle of Willis Occasionally, it is encountered in neoplasm of the brain or in some of the blood dyscrasias, but most of the cases are the result of rupture of an intracranial aneurysm arising from one of the branches of the circle of Willis The onset is usually sudden, with pain in the head, vomiting, and rapid development of either stupor or coma, depending on the extent of the bleeding If the patient does not succumb within the first twenty-four hours, there usually develops a secondary meningeal syndrome, with a positive Kernig sign, nuchal rigidity, fever, leukocytosis, bradycardia, and other evidences of increased intracranial pressure The spinal fluid is characteristic. It is uniformly bloody After sedimentation, the supernatant fluid is xanthochromic The picture slowly subsides and the patient recovers There may be a history of a number of such episodes before the fatal termination

Luetic meningitis may occur in the secondary stage of lues or in the later stages of the disease The process usually manifests itself by multiple cranial nerve palsies due to lesions at the base, the incidence of diabetes insipidus from involvement of the tuber cinereum, and other signs of central nervous disease The spinal fluid shows the characteristic pleocytosis, increased protein content, positive Wassermann reaction, and alterations in the colloidal gold curve In the exudative stage, the symptoms yield readily to active antiluetic therapy

Sympathetic meningitis (first described in 1913 by Plaut, Rehm, and Schottmuller) occurs as a neighborhood phenomenon secondary to local suppuration in the upper respiratory tract (in the ears or the sinuses) It is abacterial and is usually promptly relieved by the elimination of the foci of suppuration It is very similar in nature to the forms of pleurisy which develop in the course of subphrenic suppuration The cellular reaction in the spinal fluid may be either lymphocytic or polynuclear

Influenzal meningitis is a fairly frequent occurrence. The reaction in the spinal fluid is usually that of any other form of suppurative meningitis It is almost invariably fatal, but I have encountered one case with recovery following repeated lumbar punctures

Torula meningitis is due to the invasion of the subarachnoid space by the yeast fungus I had an opportunity (many years ago) to observe such a case which presented a meningeal syndrome with multiple cranial nerve palsies, simulating tuberculous meningitis The organisms were finally identified as Torula and the patient succumbed after a number of months

Actinomycosis is a rare infection of the central nervous system usually secondary to a similar process in the skull or as a metastatic lesion from a focus in the lung It appears in the guise of a purulent meningitis with cranial nerve palsies, shows a tendency to remissions and exacerbations, but ultimately ends fatally We have recently had an opportunity to observe such a case at Beth Israel Hospital

Meningitis may also follow in the wake of trauma to the skull, either soon after the incidence of the fracture or some time later The line of fracture may be only microscopic We encountered such a case which followed fracture in the occipital region and which terminated in an abscess in the occipital lobe with secondary meningitis

variety by the presence of severe constitutional disturbances and more pronounced meningeal signs In the severe cases of epidemic meningitis (especially the septic form) we find excessive perspiration, swelling of the joints, herpes, and purpuric spots, hence, the name spotted fever * We can distinguish this disease from typhus by demonstrating the organism in meningitis and by the presence of a positive Felix Weil reaction in typhus

Pathologically, epidemic meningitis resembles the pneumococcic form In both of them the convexity of the brain is chiefly involved Therefore the focal signs in epidemic meningitis are usually not basilar in type I have, however, occasionally observed cases of this type of meningitis that presented ocular palsies suggestive of a basilar process

Choked disk may occasionally be encountered owing to the presence of hydrocephalus Difficulties in hearing (even complete deafness) and amblyopia or total blindness may occur as sequelae of the disease The process may also eventuate in dementia

If, in a case of purulent meningitis, the source of infection cannot be determined, it is safe to assume that the meningococcus is the infecting agent, hence we should give serum immediately and continue to do so until the organism is identified

The organism is gram-negative It secretes chiefly an endotoxin There are several types and strains of this organism, hence the varying effects of the administration of serum

If the meningeal picture is prolonged beyond seven days, treatment is inefficient The prolongation of symptoms may also be due to loculation of fluid in the subarachnoid spaces In the early stages, the spinal fluid may be normal In the actively treated cases, as the process heals, the fluid becomes clearer, the organisms disappear, the albumin content falls, and the sugar figure rises

There are occasional atypical cases of meningococcemia with prolonged low grade fever, arthritis, endocarditis, and otitis which are quite baffling to the clinician until the blood culture unmasks the disease

The diagnosis is easy in epidemic times But when it occurs sporadically, this form of meningitis must be differentiated from various other meningeal syndromes

Meningismus, which accompanies acute infections, is accompanied by a clear meningeal effusion with fewer cells and without organisms This form of meningitis may be due to hypersecretion or defective absorption

Serous meningitis (term suggested by Quincke) shows fluid under increased intrathecal pressure and containing an increased amount of albumin The distinction between meningismus and serous meningitis is still not clear This condition has sometimes been called a nontuberculous hydrocephalus It may be due to trauma, toxic factors (e g alcoholic wet brain), angioneurotic edema, or venous stasis

Symonds has recently called attention to a syndrome which he terms otitic hydrocephalus because it is most frequently encountered in the course of otitic disease It manifests itself clinically by the presence of a marked papilledema, an incidence of bilateral external rectus paralysis, and evidences of high intrathecal tension The spinal fluid is usually clear, free from organisms, or any striking increase in the protein content The pressure readings are frequently 400 mm of water and over In contrast, however, to these findings, the patients present very little constitutional disturbance and a striking sense of well-being These cases, as a rule, recover after repeated lumbar punctures, but occasionally subtemporal decompression may become necessary in order to save vision I have carried out encephalography in some of these cases and have found suggestive evidence of internal hydrocephalus, apparently not due to obstruction at the foramina of exit from the ventricles but rather due to changes in the absorptive mechanism and blocking of the pathways in the arachnoid villi (hydrocephalus aresorptorius of Foerster, or communicating hydrocephalus of Dandy)

I recall a case of viridans sepsis with evidence of multiple embolic lesions in the

*I recall the case of a child which was admitted to the hospital in stupor She presented signs of a fulminating sepsis, a diffuse petechial rash, and a positive blood culture, with the organisms crowding the leukocytes in the blood smear

PROTAMINE AND INSULIN THERAPY

One Year's Experience

HERBERT POLLACK, M D and HERMAN LANDE, M D , *New York City*
From the Medical Service of Dr George Baehr and the Diabetic Clinic, Mount Sinai Hospital

It can be said that the more closely one approximates the normal physiological changes, the more ideal the therapy Rational therapy in diabetes means the avoidance of the intense fluctuations in blood sugar concentration and the control of the glycosuria It is logical to think of the insulin secretion in the normal individual as being present continuously throughout the day It is difficult to conceive of insulin secretion stopping at any time in the normal This continuous secretion is unquestionably a basal requirement of the body It is true that conditions vary from day to night, but compensatory provisions have been made by the body

The regular commercial insulin exerts its maximum activity after a latent period of from fifteen minutes to one hour Its activity is comparatively evanescent and is complete within four to six hours The variability of the latent period of the insulin and the intensity and comparatively short duration of its activity make it difficult to achieve perfect control It is customary to measure the capacity of a diabetic to dispose of glucose in terms of the total number of grams of glucose metabolized in the twenty-four hour period This concept does not take into account the rate at which the glucose enters the blood stream The maximum tolerance of the diabetic patient for glucose is dependent upon four factors

1 Amount of glucose liberated into the blood stream
2. Time over which this absorption takes place
3 Intensity of the insulin activity
4 Time during which the insulin exerts its action

The time factor, then, becomes of importance both from the point of view of the glucose as well as from the insulin It is common clinical experience that the intravenous administration of glucose can be tolerated by normal individuals without the production of a glycosuria providing the time factor is considered Woodyatt, Wilder, Sansom, Jordan, Pollack, and others have shown that the tolerance must be regarded and measured in terms of velocity as well as of total weight of injected glucose It is not surprising that diabetic patients may tolerate a definite amount of carbohydrate in a twenty-four hour period when it is administered in frequent small feedings, which would produce glycosuria if given in the three customary meals

The clinical difficulties encountered in the control of the glycosuria of the diabetic patients were at times almost insurmountable with the commercial insulin available The effort was made to have the time of maximum absorption of the carbohydrate coincide with the time of the maximum activity of the injected insulin This was not always possible These difficulties led to the use of such devices as multiple insulin injections or multiple feeding schedules As these procedures were not compatible with the usual social activities, the attempt was made to find a method whereby the action of the insulin could be prolonged Various mixtures as insulin and adrenalin, insulin and oil, insulin and metallic salts, and insulin and tannic acid were tried For numerous reasons these proved to be impractical

In 1936 Hagedorn, Jensen, and Krarup[1] published their work on a slow-acting insulin preparation They had found that when crystalline insulin is allowed to react with a protamine, a compound is formed which is insoluble at the pH of mammalian serum Such an insulin compound could be suspended in an aqueous medium and injected in the subcutaneous tissues where a deposit was formed The tissue fluids acted on this compound to release the insulin over a period of twenty-four to thirty-six hours By this means the insulin activity could be extended over the whole day Since their original announcement a great deal of work has been done on the use of this preparation in the treatment of clinical diabetes Their original method involved the use of protamine and insulin as well as regular in-

In our early work on encephalography, we met with a number of instances in which, following the introduction of air, the patient developed a meningeal syndrome with a polynucleosis varying from 5,000 to 20,000 and fever As a rule, this syndrome subsided in forty-eight hours, and was abacterial The same type of purulent meningitis may follow the introduction of serum I have observed a number of instances of aseptic meningitis following spinal anesthesia

Suppurative epimeningitis is a condition usually due to the staphylococcus It follows in the wake of a low grade staphylococcus sepsis with the formation of a metastatic focus either in the bodies of the vertebrae or in the epidural tissues The meningeal signs are usually limited to the lower part of the body There are sensitive pressure spots over the vertebrae In the early stages the spinal fluid may be clear Later on, it becomes purulent In one instance which came under my observation, the spinal fluid was clear and yet, a staphylococcus was recovered from a culture of the cerebrospinal fluid It was probably introduced as the needle passed through the infected epidural zone If these cases are recognized early and drained promptly, many of them recover This is true especially of the cases in which the meningitic process has not become too active

Occasionally, subdural hematoma may simulate a meningitic syndrome These hemorrhages into the subdural space are apt to occur following relatively slight trauma, and in cases which show no evidence of fracture or concussion There is slow oozing into the subdural space with the gradual accumulation of a considerable layer of clot, usually over the convexity of the brain The patients gradually develop headache, slowing of the pulse, suggestive focal signs, phenomena of meningeal irritation, and at times, low grade fundus changes They are apt to pass alternately into a low grade stupor and then emerge into a state of relative well-being Aerographic studies are very helpful in doubtful cases and a trephine exploration gives prompt relief in most instances

In recent years, the syndrome of acute benign lymphocytic meningitis has come up for consideration in the diagnosis of meningeal syndromes But the march of events in these cases is usually towards recovery

Finally, we must bear in mind that occasionally a primary sarcomatosis of the meninges or a secondary carcinomatosis of the coverings of the brain may give rise to a meningeal syndrome In these cases the spinal fluid is usually xanthochromic, rich in protein and cell elements, and occasionally the tumor cells can be identified in smears of the spinal fluid In these cases we meet with multiple cranial nerve palsies or polyneuritic manifestations, or both We recently reported a case of a primary pinealoma with diffuse seeding metastases throughout the subarachnoid space This patient presented oculomotor palsies with polyradicular signs and symptoms and the characteristic spinal fluid already described

CONFERENCE ON DIGESTIVE DISEASES

The Third Annual Postgraduate Institute, offering an intensive and interesting study of the Diseases of the Digestive Tract, will be conducted by The Philadelphia County Medical Society from March 28 to April 1 inclusive

The program to be held in the Bellevue-Stratford Hotel, Philadelphia, has been designed to meet the needs of all members of the profession, but particularly those in general practice

Physicians from fourteen States having attended last year's institute, an invitation to attend the 1938 session has been extended to the members of all County Societies

Lecturers, seventy-three in number, have been selected from among the foremost teachers in this great medical center While approaching the subject from specialized viewpoints, the presentations will be of a strictly practical nature and of real value to the general practitioner, who finds digestive conditions occupy a considerable portion of his time.

The only charge is a $5 00 registration fee to cover the Institute's expenses

Additional information may be secured from your County Society or from The Philadelphia County Medical Society, 21st and Spruce Streets, Philadelphia, Pa.

PROTAMINE AND INSULIN THERAPY

One Year's Experience

HERBERT POLLACK, M D and HERMAN LANDE, M D , *New York City*
From the Medical Service of Dr George Baehr and the Diabetic Clinic, Mount Sinai Hospital

It can be said that the more closely one approximates the normal physiological changes, the more ideal the therapy Rational therapy in diabetes means the avoidance of the intense fluctuations in blood sugar concentration and the control of the glycosuria It is logical to think of the insulin secretion in the normal individual as being present continuously throughout the day It is difficult to conceive of insulin secretion stopping at any time in the normal This continuous secretion is unquestionably a basal requirement of the body It is true that conditions vary from day to night, but compensatory provisions have been made by the body

The regular commercial insulin exerts its maximum activity after a latent period of from fifteen minutes to one hour Its activity is comparatively evanescent and is complete within four to six hours The variability of the latent period of the insulin and the intensity and comparatively short duration of its activity make it difficult to achieve perfect control It is customary to measure the capacity of a diabetic to dispose of glucose in terms of the total number of grams of glucose metabolized in the twenty-four hour period This concept does not take into account the rate at which the glucose enters the blood stream The maximum tolerance of the diabetic patient for glucose is dependent upon four factors

1 Amount of glucose liberated into the blood stream
2 Time over which this absorption takes place
3 Intensity of the insulin activity
4 Time during which the insulin exerts its action

The time factor, then, becomes of importance both from the point of view of the glucose as well as from the insulin It is common clinical experience that the intravenous administration of glucose can be tolerated by normal individuals without the production of a glycosuria providing the time factor is considered Woodyatt, Wilder, Sansom, Jordan, Pollack, and others have shown that the tolerance must be regarded and measured in terms of velocity as well as of total weight of injected glucose It is not surprising that diabetic patients may tolerate a definite amount of carbohydrate in a twenty-four hour period when it is administered in frequent small feedings, which would produce glycosuria if given in the three customary meals

The clinical difficulties encountered in the control of the glycosuria of the diabetic patients were at times almost insurmountable with the commercial insulin available The effort was made to have the time of maximum absorption of the carbohydrate coincide with the time of the maximum activity of the injected insulin This was not always possible. These difficulties led to the use of such devices as multiple insulin injections or multiple feeding schedules As these procedures were not compatible with the usual social activities, the attempt was made to find a method whereby the action of the insulin could be prolonged Various mixtures as insulin and adrenalin, insulin and oil, insulin and metallic salts, and insulin and tannic acid were tried For numerous reasons these proved to be impractical

In 1936 Hagedorn, Jensen, and Krarup[1] published their work on a slow-acting insulin preparation They had found that when crystalline insulin is allowed to react with a protamine, a compound is formed which is insoluble at the pH of mammalian serum Such an insulin compound could be suspended in an aqueous medium and injected in the subcutaneous tissues where a deposit was formed The tissue fluids acted on this compound to release the insulin over a period of twenty-four to thirty-six hours By this means the insulin activity could be extended over the whole day Since their original announcement a great deal of work has been done on the use of this preparation in the treatment of clinical diabetes Their original method involved the use of protamine and insulin as well as regular in-

In our early work on encephalography, we met with a number of instances in which, following the introduction of air, the patient developed a meningeal syndrome with a polynucleosis varying from 5,000 to 20,000 and fever As a rule, this syndrome subsided in forty-eight hours, and was abacterial The same type of purulent meningitis may follow the introduction of serum I have observed a number of instances of aseptic meningitis following spinal anesthesia

Suppurative epimeningitis is a condition usually due to the staphylococcus It follows in the wake of a low grade staphylococcus sepsis with the formation of a metastatic focus either in the bodies of the vertebrae or in the epidural tissues The meningeal signs are usually limited to the lower part of the body There are sensitive pressure spots over the vertebrae In the early stages the spinal fluid may be clear Later on, it becomes purulent In one instance which came under my observation, the spinal fluid was clear and yet, a staphylococcus was recovered from a culture of the cerebrospinal fluid It was probably introduced as the needle passed through the infected epidural zone If these cases are recognized early and drained promptly, many of them recover This is true especially of the cases in which the meningitic process has not become too active

Occasionally, subdural hematoma may simulate a meningitic syndrome These hemorrhages into the subdural space are apt to occur following relatively slight trauma, and in cases which show no evidence of fracture or concussion There is slow oozing into the subdural space with the gradual accumulation of a considerable layer of clot, usually over the convexity of the brain The patients gradually develop headache, slowing of the pulse, suggestive focal signs, phenomena of meningeal irritation, and at times, low grade fundus changes They are apt to pass alternately into a low grade stupor and then emerge into a state of relative well-being Aerographic studies are very helpful in doubtful cases and a trephine exploration gives prompt relief in most instances

CONFERENCE ON DIGESTIVE DISEASES

The Third Annual Postgraduate Institute, offering an intensive and interesting study of the Diseases of the Digestive Tract, will be conducted by The Philadelphia County Medical Society from March 28 to April 1 inclusive

The program to be held in the Bellevue-Stratford Hotel, Philadelphia, has been designed to meet the needs of all members of the profession, but particularly those in general practice

Physicians from fourteen States having attended last year's institute, an invitation to attend the 1938 session has been extended to the members of all County Societies

Lecturers, seventy-three in number, have been selected from among the foremost teachers in this great medical center While approaching the subject from specialized viewpoints, the presentations will be of a strictly practical nature and of real value to the general practitioner, who finds digestive conditions occupy a considerable portion of his time

The only charge is a $5 00 registration fee to cover the Institute's expenses

Additional information may be secured from your County Society or from The Philadelphia County Medical Society, 21st and Spruce Streets, Philadelphia, Pa

the disturbance of control during the transition from the regular to the protamine insulin lasting up to ten days He treated twenty-five patients including age groups to seventy years with satisfactory results Waring et al[15] reported experiences with fourteen patients ranging in age from 13 to 51 years He reported better control of fasting blood sugars and decreased blood sugar fluctuations The hypoglycemic reactions were generally fewer and milder He observed no difference in action between the protamine and insulin compound with or without zinc. Boyd[16] published her results on the treatment of twenty-five diabetic children She states that there is a wider margin of safety in errors in the dose of insulin as well as in the food taken She concludes that with protamine there is better control of the disease and that fewer injections per day are necessary Black[17] reports six cases, his best results being in the so-called insulin sensitive group Bowcock[18] accomplished perfect control in most of his sixteen cases using the single dose method of administration Sprague, Blum, Osterberg, Kepler, and Wilder[19] presented an excellent summary of their early experiments with the insulin protamine compounds They demonstrated conclusively the complete absence of a prompt response to this preparation as well as the prolongation of its activity for at least thirty-six hours Many hypoglycemic reactions were observed with their early cases which were characteristically less violent than those following the use of regular insulin They were among the first to point out the necessity of supplementary doses of regular insulin during the first few days of the transition to the protamine therapy They used protamine preparations as an adjunct in the treatment of diabetic infection and ketonic coma

Krarup's original statement said

> It is very uncertain how much can be gained for the treatment of diabetes mellitus by a uniform prolonged absorption of insulin during the day, even though it is probable that a considerable improvement can be obtained in certain cases, whereas there seems that much can be said for the idea that slow and uniform absorption during the night will always be a great advantage

Krarup originally treated his diabetic patients with protamine insulin in the evening and the old insulin in the morning He found this method of treatment much more satisfactory than the exclusive use of the old insulin It has been found that his theoretical arguments do not hold true In this country, as suggested by Wilder, there is conclusive evidence that the single dose of insulin with protamine in the morning can effectively control diabetes One reason for Krarup's early success with his protamine preparation is in part due to the diets which he used While the total carbohydrate, fat, and protein content of his diets do not differ from those in this country, the source of the carbohydrates are completely different The Danish diet contains a minimum of fruits and other sources of soluble sugars The American diets contain liberal quantities of readily absorbed sugar It is good practice in prescribing diets for patients using protamine and insulin to determine their optimum carbohydrate distribution with the conventional three meal habit Many patients will show periodic glycosurias when the carbohydrate distribution follows the usual ⅓, ⅓, ⅓ division Glycosuria may occur shortly after breakfast and, as is usually the case in these patients, there is a late night hypoglycemia The distribution of ⅕, ⅖, ⅖ or ⅕, ⅕, ⅗ is better tolerated without altering the insulin dosage. It is also better to avoid the use of the immediately available sugars such as orange or other fruit juice which produce greater fluctuations in the glycemic levels Cereals, breads, and vegetables are a better source, as the glucose is liberated more slowly, uniformly, and over a longer period of time The latter type of carbohydrate is much more suitable for use with the new slow-acting insulin Occasionally the simple expedient of substituting cereal for fruit at breakfast will eliminate the temporary postprandial glycosuria and also the necessity for a supplementary dose of the old rapidly-acting insulin The successful use of protamine and insulin will require the individualization of the diets to a greater extent than previously However the advantages of the new therapy are so great as to make this factor negligible

The procedure in this series was to admit the patients to the hospital for a preliminary period of study Diabetic

sulin They demonstrated that the sharp peak in blood sugar changes usually seen three or four hours after the injection of ordinary insulin was largely avoided by the use of the protamine and insulin mixtures They observed no local ill-effects and no allergic reactions They obtained their best results by giving the patients ordinary insulin in the morning and protamine insulin in the evening, or by giving the protamine and insulin at twelve hour intervals Root and his coworkers[2] in Boston corroborated these results in all respects They emphasized that because of its slow action this preparation might not be satisfactory in diabetic emergencies during infections or acidosis Scott and Fisher[3 4] working on the American continent found that the protamine obtained from the Pacific salmon worked as well as the original trout protamine suggested by the Danish investigators They also showed that the addition of zinc facilitated the formation of the protamine insulin complex They explained the slow activity of the protamine compounds on the basis of insolubility alone Several months later Joslin and Root and their associates[5] published the results summarizing the therapy of ninety-one patients with protamine and insulin mixtures In the light of this increased experience, they were able to elaborate their earlier results They found a greater liberality in carbohydrate distribution possible than they had originally suspected Their indications for the use of the protamine and insulin were (1) high fasting sugars, (2) avoidance of multiplicity of insulin injections, (3) sensitivity to insulin as indicated by frequency of reactions, (4) hepatomegalia, (5) lipodystrophy They also suggested its possible value in mild diabetics with hyperlipemia and in cardiac cases in whom hypoglycemic reactions must be avoided Gray[6] compared the value of insulin tannate with insulin and protamine He found that insulin tannate produced numerous local reactions because of bacterial contaminations In the same patients he was able to compare the two preparations and found both equally effective. Gray observed the subcutaneous lumps and skin reactions with protamine insulin as well as with the tannate He preferred the tannate for general usage because of its availability and cheapness Rabinowitch[7 8] lists the contraindications for the use of protamine as coma, infection, and emergency pre- and postoperative treatment of surgical diabetics He was quite impressed with Scott's statement that zinc is a normal constituent of insulin regardless of the method of preparation He found clinically that the addition of zinc to the extent of one milligram per 500 units of insulin definitely prolonged the activity up to thirty-six hours in some patients He observed a latent period of approximately ten days before complete efficiency of the protamine and insulin preparations could be attained He found this type preparation most efficacious in cases which had required multiple injections He was particularly impressed with the large amounts of insulin which could be tolerated without hypoglycemic reactions Campbell, Fletcher, and Kerr[9] observed that diets very high in carbohydrate and low in fat were apparently less suitable for this type of treatment They observed the postprandial glycosuria after breakfast which they overcame by timing the injections one to three hours before this meal and by the use of a supplementary dose of regular insulin Richardson and Bowie[10] summarized the literature with the following conclusions

1 Protamine compounds act more slowly than regular insulin

2 They act over a much longer period of time

3 These mixtures are accompanied by fewer hypoglycemic reactions

4 They steady the blood sugar levels

5 The full effect is shown about five days after the time of the first injection

6 Patients report a definite subjective improvement.

There have been numerous reports from various clinics dealing with their individual results under different conditions Winnett[11] reported fairly satisfactory results in four cases He apparently experienced considerable difficulty with hypoglycemic reactions Conklin[12] published the results of the treatment of three cases Palmer and Capaccio[13] summarized the results of their treatment of sixteen patients They were fairly successful with the single dose method of administration Smith[14] used two doses daily at twelve hour intervals He also noted

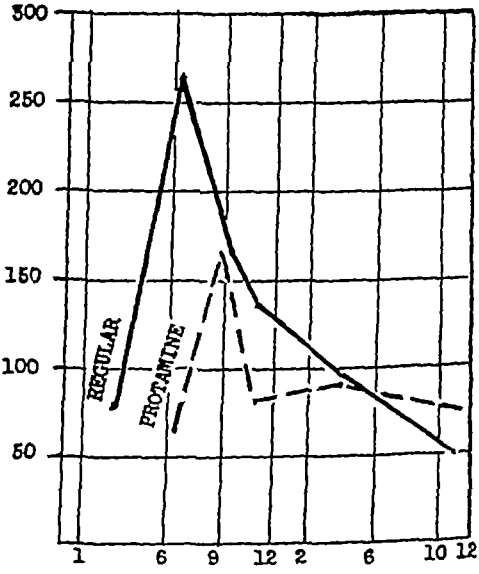
tically all shocks could be traced to improper handling of the insulin by both patients and nurses

At first it was said that the protamine insulin lost its activity in three to five days of standing It has been found that standing up to fourteen days does not impair its activity when kept cold If the mixture is allowed to stand for any length of time in a warm room, the precipitate will adhere to the glass and consequently lose part of its available activity It has been necessary for the patients to bring in their empty protamine vials to check this The syringes should be cool, dry, and sterile at the time of use A 24 to 25 gauge needle is preferable

These difficulties described have been obviated in part by the introduction of certain stabilizing agents, namely zinc salts The preparation which we have used has been supplied through the courtesy of the manufacturers, Eli Lilly & Company, Indianapolis, Ind, and is now available in single vial packages The vial contains the mixture of Insulin, Protamine and Zinc It is quite stable within the limits of the time stamped on the package The ease of management by the patient and its definite, uniform activity make it practical for general distribution The amount of zinc present is said to be one mgm in each 500 units of insulin This is well within the tolerance of the normal human being It must be clearly understood that certain of our early prejudices against this preparation have been eliminated since the introduction of zinc stabilized mixture Reactions with the protamine and insulin preparation may be as violent as those with the regular insulin Fortunately, after the first few cases we did not observe them very often Subjectively, the patients feel better with the new insulin Psychically, of course, there is a tremendous relief especially in the wage earners and school children who are forced to take midday doses

The daily dose of regular insulin required is determined for the patient Protamine insulin to the extent of approximately three-quarters of the amount of the regular insulin is then ordered to be given daily about thirty minutes before breakfast Regular insulin in five unit doses is given immediately before each of the three meals on the first day Rarely if ever will one observe hypoglycemic reactions with this regime The patient is instructed to collect the fractional urine specimens during the succeedings days These specimens are collected immediately before each meal and at bedtime From the amount of glycosuria present the supplementary dose of regular insulin is varied In the event of a complete absence of sugar in the urine before any one meal, regular insulin is omitted At the end of four to six days the regular insulin is omitted in all patients and the urines followed closely to determine the peak incidence of glycosuria during the day Usually one finds this is within an hour after breakfast The diet is then rearranged so that the carbohydrate distribution is shifted to $\frac{1}{5}$, $\frac{3}{5}$, $\frac{3}{5}$ If the glycosuria occurs at bedtime or immediately after supper, the shift is to $\frac{2}{5}$, $\frac{2}{5}$, $\frac{1}{5}$ This regime is followed for at least forty-eight hours and another series of urines are analyzed If the postprandial glycosuria is not eliminated by this simple procedure, then the fruits are eliminated from the offending meal and carbohydrates are substituted in the form of the complex starches This method has been found to be satisfactory in the majority of the cases If the patient complains of headache or mild hypoglycemic reactions on awakening in the morning or if the fasting blood sugars are excessively low, then fruit juices are ordered to be taken immediately upon arising even before the protamine injection for the day This amount of carbohydrate is of course deducted from the regular breakfast We have found it preferable to avoid the use of fruits at supper time as a matter of routine This means that all the carbohydrate given at this particular meal is of the type that is slowly digested and slowly absorbed so that its activity is prolonged throughout the long interval until the next meal

As can be seen by reading the protocols, certain of these patients could not be brought under perfect control by means of the single injection of protamine insulin compound daily These were the patients who showed rapidly elevated blood sugar concentrations immediately after breakfast, lasting at the



patients who had been under observation in our clinic for at least three years were chosen as the subjects for the first studies Those patients who were difficult to control and who presented a real problem in management were first given the protamine and insulin This was done in order to subject the new agent to as severe a test as possible After a period of stabilization with regular insulin and a weighed diet, the twenty-four hour blood sugar cycle was determined Bloods were drawn by capillary puncture at 6 30, 9, 11 A M , 4 and 11 P M The meals were served at 7 30 and 11 30 A M , and 4 30 P M The blood sugar concentrations were determined by the micro method of Schaffer and Hartman Protamine insulin was then administered In the first few cases the procedure as advocated by Hagedorn and followed by Root was used, namely, a morning dose of regular insulin and a mid-afternoon dose of protamine insulin In subsequent cases, following a personal communication by Wilder, the single morning dose method was used When the glycosuria had been controlled, another twenty-four hour blood sugar cycle was determined

In all respects our results confirmed those of the Danish, Boston, and Mayo Clinic investigators The maximum activity of the drug was noted on the third to the fifth day after the onset of its administration The most striking effect was the leveling of the fluctuations in the blood sugar concentration variations J Z (Chart I) had blood sugar variation from 40 to 350 mgs daily After protamine therapy had been stabilized, the blood sugar varied from 80 to 135, well within the normal limits

The technic of administration and the gauging of the dosage is different from that employed in the use of the regular insulin These patients have been observed in the outpatient department now for several months Many facts were learned concerning the common errors made in its administration Patients must be instructed carefully in the technic of the withdrawal of the insulin from the bottle Since this admixture contains a slight excess of the protamine which exerts its protein-like action on the surface tension, frothing of the liquid occurs very easily Hence when the usual technic of forcing air into the vial is followed and the air forced up through the protamine suspension, considerable frothing occurs This has two disadvantages *first,* an uneven redistribution of the suspension, and *second,* a waste owing to the inability of utilizing almost ½ c c in each bottle It becomes quite important to instruct the patients to put the air in first, with the vial in the upright position, and then turn the bottle over and withdraw the required amount

The time and technic of withdrawal is also important Many patients slowly withdraw the plunger to the mark This allows at times for a visible settling of the

CHART I

suspension Consequently, the first few times a bottle is used more insulin than is calculated is withdrawn This can easily be checked by asking the patient to bring in their partially used vials at their regular visits When a group of several vials are examined side by side, the difference in density of the turbidity can easily be seen The instructions must be explicit on the resuspension of the precipitate each time immediately before the vial is used Many patients will agitate the bottle carefully and get a uniform suspension Then they set it aside and prepare the syringe, and without further shaking, withdraw the insulin This is not proper technic and leads at times to severe insulin reactions After the initial stabilization period, prac-

tically all shocks could be traced to improper handling of the insulin by both patients and nurses

At first it was said that the protamine insulin lost its activity in three to five days of standing It has been found that standing up to fourteen days does not impair its activity when kept cold If the mixture is allowed to stand for any length of time in a warm room, the precipitate will adhere to the glass and consequently lose part of its available activity It has been necessary for the patients to bring in their empty protamine vials to check this The syringes should be cool, dry, and sterile at the time of use A 24 to 25 gauge needle is preferable

These difficulties described have been obviated in part by the introduction of certain stabilizing agents, namely zinc salts The preparation which we have used has been supplied through the courtesy of the manufacturers, Eli Lilly & Company, Indianapolis, Ind , and is now available in single vial packages The vial contains the mixture of Insulin, Protamine and Zinc It is quite stable within the limits of the time stamped on the package The ease of management by the patient and its definite, uniform activity make it practical for general distribution The amount of zinc present is said to be one mgm in each 500 units of insulin This is well within the tolerance of the normal human being It must be clearly understood that certain of our early prejudices against this preparation have been eliminated since the introduction of zinc stabilized mixture Reactions with the protamine and insulin preparation may be as violent as those with the regular insulin Fortunately, after the first few cases we did not observe them very often Subjectively, the patients feel better with the new insulin Psychically, of course, there is a tremendous relief especially in the wage earners and school children who are forced to take midday doses

The daily dose of regular insulin required is determined for the patient Protamine insulin to the extent of approximately three-quarters of the amount of the regular insulin is then ordered to be given daily about thirty minutes before breakfast Regular insulin in five unit doses is given immediately before each of the three meals on the first day Rarely if ever will one observe hypoglycemic reactions with this regime The patient is instructed to collect the fractional urine specimens during the succeedings days These specimens are collected immediately before each meal and at bedtime From the amount of glycosuria present the supplementary dose of regular insulin is varied In the event of a complete absence of sugar in the urine before any one meal, regular insulin is omitted At the end of four to six days the regular insulin is omitted in all patients and the urines followed closely to determine the peak incidence of glycosuria during the day Usually one finds this is within an hour after breakfast The diet is then rearranged so that the carbohydrate distribution is shifted to $\frac{1}{5}$, $\frac{3}{5}$, $\frac{3}{5}$ If the glycosuria occurs at bedtime or immediately after supper, the shift is to $\frac{3}{5}$, $\frac{2}{5}$, $\frac{1}{5}$ This regime is followed for at least forty-eight hours and another series of urines are analyzed If the postprandial glycosuria is not eliminated by this simple procedure, then the fruits are eliminated from the offending meal and carbohydrates are substituted in the form of the complex starches This method has been found to be satisfactory in the majority of the cases If the patient complains of headache or mild hypoglycemic reactions on awakening in the morning or if the fasting blood sugars are excessively low, then fruit juices are ordered to be taken immediately upon arising even before the protamine injection for the day This amount of carbohydrate is of course deducted from the regular breakfast We have found it preferable to avoid the use of fruits at supper time as a matter of routine This means that all the carbohydrate given at this particular meal is of the type that is slowly digested and slowly absorbed so that its activity is prolonged throughout the long interval until the next meal

As can be seen by reading the protocols, certain of these patients could not be brought under perfect control by means of the single injection of protamine insulin compound daily These were the patients who showed rapidly elevated blood sugar concentrations immediately after breakfast, lasting at the

most for about one hour The delayed action of the protamine insulin does not allow for the control of this short period Up to the time of the writing of this report, this type of reaction has been handled by the supplementary injection of the old insulin at the same time, but in doses no larger than five to ten units The supplementary dose has been given with a separate syringe in a different part of the body These patients therefore required two injections daily The advantage remains, however, that the injections are both given early in the morning, while the patient is still at home and has all required facilities This frees him for the rest of the day from any bother Patients express their opinion that they prefer the new insulin because of their freedom during working hours

One patient was found to be allergic to protamine and insulin However this patient was also sensitive to crystalline insulin as well as all brands of commercial insulin available No fat atrophy has been observed The regular insulin syringe has to be discarded in many cases because the single dose technic may require up to 100 units at a time

One of the aims of this new therapy is simplification in administration, the required preliminary hospitalization period defeated its own purpose Consequently, we attempted to change from the standard insulin to the protamine in ambulatory patients This is quite feasible in a limited group In the markedly brittle cases the transition is too dangerous to be carried out unless the patient will submit to a short period of hospitalization T F (Case 8) illustrates this point She required four injections a day of the standard insulin (40–20–20–15, the latter being a midnight dosage) Protamine insulin therapy was introduced starting with a preliminary dosage of one-half the amount of the required standard insulin This was gradually increased to seventy-five units, thirty minutes before breakfast daily At present the patient's urine shows no glycosuria and she is having no periods of hypoglycemia During the transition period, however, the patient had a severe reaction while riding in the subway, lost complete consciousness, and awoke to find herself in a strange hospital in another borough Fortunately, no serious damage was done, but potentially this presents a menace

The ambulatory introduction to the therapy is now limited to the milder cases where it is a question of convenience to take only one injection daily

There is no doubt that protamine and insulin therapy, properly stabilized, represents a distinct advance in the treatment of the diabetic patient The juvenile and adolescent diabetics until recently presented a pathetic problem These unfortunate children were practically social outcasts because of the fact that they were known to take injections many times daily, and because of their dietary restrictions The psychological relief at not having to carry syringes, needles, alcohol, cotton, and insulin to school for their midday and afternoon injections is tremendous. The patient who worked and who had no facilities for his midday injections frequently neglected it with detrimental effects upon the control of his diabetes With protamine and the single dose administration, these daily handicaps have vanished Hypoglycemic reactions have not been entirely eliminated by the use of protamine and insulin, especially during the transition period The most common time of the day for the occurrence of these reactions is during the early morning hours while the patient is sleeping The reason for this is quite obvious as this is the time of the day the furthest removed from the previous meal and, as pointed out previously, the protamine and insulin activity is practically uniform throughout the twenty-four hour period During the transition period the patient and the patient's relatives or nurses must be thoroughly instructed in the care of the patient and in the signs and symptoms to be watched for at these hours Happily, once the readjustment has been completed, these reactions are rare and never very severe In the adolescent and adult patient the introduction of a small meal at bedtime frequently prevents this reaction This fourth meal is no hardship, as generally the social conventions make it more of a hardship to refrain from a late evening supper, and the ultimate aim of any therapy in a disease such as diabetes mellitus is to allow the patient to live as

normal a life as is consistent with his condition An effort is made to keep the insulin administration as constant as possible, and to vary the type and total amount of the daily distribution of the carbohydrates for each individual patient according to his reactions

Another caution which must be given to those patients using protamine and insulin is the danger of hypoglycemic reactions following unusual exercise This is illustrated by a patient whose habits ordinarily were sedentary, but who ran two blocks for a street car one morning and precipitated an acute hypoglycemic reaction

It is important, therefore, that the patient carry with him some form of carbohydrate to be taken immediately before or after exercise periods One of the adolescent diabetics who engaged in the sport of basketball has learned to drink one-half glass of orange juice before the game in which she plays Regularity in the hours of meals does not have to be as rigidly adhered to with protamine as with standard insulin It is preferable to space the time between the meals as far as possible The ordinary hospital routine calls for breakfast at 7 30 A M , with luncheon four hours later, and the evening meal five hours after that, leaving a free interval of approximately fourteen hours without food This is not conducive to the best insulin therapy especially with protamine If there is any tendency towards early morning hypoglycemia, the evening meal should be taken as late as possible

The incidence of ketosis has been markedly decreased in the group of patients receiving protamine and insulin therapy With the use of the old, rapidly acting insulin it was not uncommon to see the patient undergo periods of intense glycosuria associated with mild to severe ketosis The causes for these periods of glycosuria are still unknown They do occur at times with protamine therapy, the difference being that the return to the normal control with protamine insulin takes place spontaneously without alteration of the insulin dosage One also does not see the rapid changes in the tolerance which followed the hyperglycemia, and, as stated above, the urines rarely show evidences of the ketone bodies even, as has been observed, when the glycosuria is present to ten per cent

The advantages of the protamine and insulin therapy then become quite apparent. The chief one is in the reduction of the total number of injections required daily It can be seen on the protocols, even though the control of the glycosuria is not always perfect, with this new insulin it is always equal to and generally better than that obtained with the multiple dose method of the old insulin There is in addition the advantage of avoiding the preparation of syringes and needles more than once a day In several of the cases cited the control of the blood sugar as well as the glycosuria has been perfect with the protamine therapy With these patients, such control was never achieved with the standard insulin Another advantage is the decrease in the number of hypoglycemic reactions Rarely does one experience severe reactions after the initial transitional stage There is no adequate explanation to be offered for the sense of well-being which these patients experience

During the past year a number of the patients who have been using the protamine and insulin compound as well as the protamine, insulin and zinc compound have had intercurrent infections The effects on the carbohydrate tolerance of these diabetic patients is very much the same as those observed in the past when the standard insulin was used It was found that protamine insulin therapy should be continued throughout the acute episode with the addition of small doses of regular insulin according to the degree of glycosuria and hypoglycemia This means that those patients who normally received a single dose of protamine and insulin before breakfast were given supplementary doses of from five to ten units of regular insulin before each of their meals during the time that the tolerance was depressed It is important to note that ketosis was conspicuously absent in the acute episodes even at its onset in those patients using the slow-acting insulin This is in decided contrast with our past experience with ketosis which was almost always present at least during the

most for about one hour The delayed action of the protamine insulin does not allow for the control of this short period Up to the time of the writing of this report, this type of reaction has been handled by the supplementary injection of the old insulin at the same time, but in doses no larger than five to ten units The supplementary dose has been given with a separate syringe in a different part of the body These patients therefore required two injections daily The advantage remains, however, that the injections are both given early in the morning, while the patient is still at home and has all required facilities This frees him for the rest of the day from any bother Patients express their opinion that they prefer the new insulin because of their freedom during working hours

One patient was found to be allergic to protamine and insulin However this patient was also sensitive to crystalline insulin as well as all brands of commercial insulin available No fat atrophy has been observed The regular insulin syringe has to be discarded in many cases because the single dose technic may require up to 100 units at a time

One of the aims of this new therapy is simplification in administration, the required preliminary hospitalization period defeated its own purpose Consequently, we attempted to change from the standard insulin to the protamine in ambulatory patients This is quite feasible in a limited group In the markedly brittle cases the transition is too dangerous to be carried out unless the patient will submit to a short period of hospitalization T F (Case 8) illustrates this point She required four injections a day of the standard insulin (40–20–20–15, the latter being a midnight dosage) Protamine insulin therapy was introduced starting with a preliminary dosage of one-half the amount of the required standard insulin This was gradually increased to seventy-five units, thirty minutes before breakfast daily At present the patient's urine shows no glycosuria and she is having no periods of hypoglycemia During the transition period, however, the patient had a severe reaction while riding in the subway, lost complete consciousness, and awoke to find herself in a strange hospital in another borough Fortunately, no serious damage was done, but potentially this presents a menace

The ambulatory introduction to the therapy is now limited to the milder cases where it is a question of convenience to take only one injection daily

There is no doubt that protamine and insulin therapy, properly stabilized, represents a distinct advance in the treatment of the diabetic patient The juvenile and adolescent diabetics until recently presented a pathetic problem These unfortunate children were practically social outcasts because of the fact that they were known to take injections many times daily, and because of their dietary restrictions The psychological relief at not having to carry syringes, needles, alcohol, cotton, and insulin to school for their midday and afternoon injections is tremendous. The patient who worked and who had no facilities for his midday injections frequently neglected it with detrimental effects upon the control of his diabetes With protamine and the single dose administration, these daily handicaps have vanished Hypoglycemic reactions have not been entirely eliminated by the use of protamine and insulin, especially during the transition period The most common time of the day for the occurrence of these reactions is during the early morning hours while the patient is sleeping The reason for this is quite obvious as this is the time of the day the furthest removed from the previous meal and, as pointed out previously, the protamine and insulin activity is practically uniform throughout the twenty-four hour period During the transition period the patient and the patient's relatives or nurses must be thoroughly instructed in the care of the patient and in the signs and symptoms to be watched for at these hours Happily, once the readjustment has been completed, these reactions are rare and never very severe In the adolescent and adult patient the introduction of a small meal at bedtime frequently prevents this reaction This fourth meal is no hardship, as generally the social conventions make it more of a hardship to refrain from a late evening supper, and the ultimate aim of any therapy in a disease such as diabetes mellitus is to allow the patient to live as

Now taking sixty-five units of protamine once daily Glycosuria well-controlled No reactions Diet 125–60–60 divided ⅓,⅓,⅓ *Note* During transition period from regular insulin to protamine insulin the patient suffered severe hypoglycemic reaction in subway when she was late getting home for lunch However, has had none since

CASE 9 M T, male, age fourteen Diabetes about five years duration Very difficult to control Frequent episodes of hypoglycemia and transient ketosis Glycosuria at times intense. Previous insulin sixty units daily divided in three doses Now taking protamine fifty-five units once daily before breakfast with ten units of regular insulin Control of glycosuria while somewhat better than with regular insulin is still not good Diet of 175–90–100 divided ⅜,⅜,⅜

CASE 10 A M, male, age thirty-three. Diabetes of eleven years duration. Diabetes has become progressively more severe over a period of time. Whereas patient was controlled easily with no insulin at first, for the past several years he has been requiring increasing dosages of insulin without adequate control of the glycosuria. Previous to protamine therapy required seventy units of regular insulin daily divided into two doses Now controlled on fifty units of protamine, once daily before breakfast with ten units of regular insulin

CASE 11 G S, male, age fifteen Diabetes of five years duration Control never adequate with regular insulin given in three doses daily totaling from fifty to sixty units Now taking twenty-five units of protamine once daily before breakfast with excellent control of glycosuria Diet of 150–80–60 Normal division of the diet

CASE 12 S K, female, age thirty-three Diabetes one year's duration Admitted to hospital with carbuncle and general sepsis, at which time she required approximately 100 units of regular insulin daily given in hourly and two hourly doses Protamine insulin was introduced at the height of the septic period, and it was found that the protamine insulin supplemented with one dose of water soluble insulin would replace effectively the multiple dose system in effect up to the time. The control of glycosuria with the protamine was excellent whereas the frequent small doses of water soluble insulin gave only fair control Patient now taking thirty-five units of protamine once daily with excellent control of glycosuria Diet of 150–70–60 with normal division No hypoglycemic episodes No ketosis

CASE 13 P L, female, age fifty-three Diabetes of seven years duration Always very difficult to control on regular insulin, requiring from two to four injections daily totaling sixty units Now receiving forty units of protamine daily Control of glycosuria is only fair Patient maintaining fractional percents of sugar in the urine in contrast to the glycosurias of one and two percent on the regular dose of insulin Diet 120–60–80

CASE 14 K. S, female, age thirty-seven Diabetes eleven years duration Always very difficult to control requiring three and four injections of regular insulin daily totaling from seventy-five to one hundred units Control of glycosuria was very poor Frequent episodes of mild ketosis and severe nocturnal hypoglycemia Patient now receiving eighty units of protamine once daily Control of glycosuria excellent most of the time, with occasional exceptions when patient goes on a dietetic spree There have been no hypoglycemic episodes for several months on protamine therapy Diet of 120–60–80, ⅜,⅜,⅜

CASE 15 A J, female, age thirty-seven Duration of diabetes twelve years Control of diabetes has been exceedingly difficult because of frequent hypoglycemic episodes as well as intense glycosuria, even in hospital on weighed diet regime Previous insulin therapy of three and four injections totaling ninety-five units Now taking seventy units of protamine and ten of regular insulin once daily before breakfast Has frequent hypoglycemic reactions in the early morning hours Control of glycosuria has been difficult, but with division of diet to ⅓,⅜,⅜ fractional urine specimens show only nocturnal glycosurias with the complete disappearance of the nocturnal hypoglycemia Diet of 120–60–100

CASE 16 J S, male, age twenty-six Duration of diabetes five years Difficult to control on regular insulin with three injections daily totaling eighty units Now taking eighty units of protamine before breakfast Control of glycosuria is excellent Hypoglycemic episodes have disappeared completely Diet of 140–60–100, divided ⅓,⅓,⅓

CASE 17 J Z, female, age twenty-one. Duration of diabetes ten years Control very difficult with three injections daily totaling 120 units Now taking sixty units of protamine once daily with perfect control of glycosuria Diet of 150–60–60 No episodes of hypoglycemia nor ketosis with protamine insulin therapy in contrast to that with the regular insulin

CASE 18 B B, female, age twenty-three Duration of diabetes twelve years Control of diabetes difficult with ninety units

very early stage of the intercurrent infection

The use of protamine insulin zinc compound in the management of the postoperative and surgical diabetic patients represents a distinct advance In the past it has been the custom on this service to use the multiple insulin injection method coupled with multiple feeding schedules in those postoperative patients whose diabetes was difficult to control In a few cases which we have observed, a single dose of protamine and insulin compound in the morning has served to control glycosuria when the multiple feeding schedule was maintained This is of particular value in those postoperative cases where the oral ingestion is limited to small amounts of fluids taken at frequent intervals The protocols given herein represent the series of patients who have been under observation for a period of six months or more We have in addition an equal number of patients who have been under observation for shorter periods of time It was thought that this report should be limited to those patients who have been subjected to observation long enough to evaluate the therapy

Protocols

Case 1 E M, female, age twenty-three Diabetes of seven years duration Required insulin *25–5–20* Frequent episodes of mild ketosis Glycosuria fairly well-controlled Acute middle ear infection August *1936* following which protamine therapy was started Seven months later taking thirty-five units protamine injected single dose before breakfast. Sugar free in all specimens No reactions No additional insulin Diet of 120–60–100, divided ⅓,⅓,⅓ *Comment* Patient doing well on protamine

Case 2 I L, male, aged twenty-nine Diabetes ten years duration Always difficult to control Frequent episodes of nocturnal hypoglycemia Glycosuria never adequately controlled Received regular insulin in divided doses from two to four injections daily, totaling up to ninety units daily Now receiving fifty units of protamine and ten regular before breakfast. Diet 150–80–120, divided ⅜,⅜,⅜ Complete disappearance of hypoglycemic episodes Glycosuria adequately controlled except when patient goes on a spree It is to be noted that even with the diet indiscretions that the severe fluctuations in the glycosuria do not occur

Case 3 G G, female, age twenty-two First patient to receive insulin at Mt. Sinai Hospital Diabetes of fourteen years duration Previous insulin dosage of sixty units daily, divided in two and at times, three injections Now receiving sixty units of protamine once daily before breakfast. Excellent control of glycosuria No hypoglycemic episodes Slow but constant gain in weight since the introduction of protamine Diet 125–70–60, divided ⅓,⅓,⅓

Case 4 K R, female, age thirty-five. This patient particularly difficult diabetic to control at all times Duration of diabetes, ten years Frequent episodes of hypoglycemia Almost constant glycosuria which necessitated several hospital admissions for control Previous insulin was 20–10–10, but glycosuria was never controlled Now receiving one injection daily thirty-five units of protamine Inconstant fractional glycosuria No hypoglycemic episodes No ketosis Diet 120–60–100 ⅜,⅛,⅜

Case 5 J B, female, age nineteen Duration of diabetes five years Previous insulin eighty units daily divided into three doses Frequent episodes of hypoglycemia and intense glycosuria Now receiving fifty-five units of protamine once daily before breakfast Entirely sugar free No reactions No ketosis Diet 150–80–80 divided ⅓,⅓,⅓

Case 6 G K, female, age sixteen Previous insulin thirty units daily divided in two doses Admitted to the hospital in ketosis at which time she required over 100 units daily Shifted to protamine Now takes sixty-five units once daily before breakfast Control of glycosuria is excellent Diet of 145–65–110, divided ⅓,⅓,⅓ Occasional very mild late evening hypoglycemia

Case 7 P G, female, age eighteen. Diabetes eight years duration Always difficult to control Has never been sugar free since onset of diabetes Required four doses daily of regular insulin totaling fifty-five units Repeated episodes of mild and severe ketosis Now taking sixty units protamine once daily before breakfast. Glycosuria adequately controlled Diet of 130–60–50, ⅓,⅓,⅓ One severe reaction when patient refused to eat supper and breakfast consecutively

Case 8 T F, female, age forty-four Diabetes three years duration Previous insulin four injections daily totaling ninety units Glycosuria never controlled Frequent episodes of hypoglycemic reactions

ASTHMA AND TUBERCULOSIS

JOSEPH R WISEMAN, A B, M D and FREDERICK N MARTY, A B, M D, *Syracuse*
Professor of Clinical Medicine, College of Medicine, Syracuse University (J.R.W.), Clinical Instructor, College of Medicine, Syracuse University (F.N.M.)

Our interest in the relationship between asthma and tuberculosis was stimulated by observation of the following case

C R., aged forty-five, was admitted to the Syracuse Memorial Hospital April 7, 1936 He had two children both of whom had asthma, and a wife who was well His mother and two maternal uncles also had had asthma. At the age of nine months, following an attack of bronchopneumonia, he began to have asthma and has been partially incapacitated ever since He never could attend school regularly or hold a steady job He has changed occupations often and has worked as a farmer, taxi driver, and automobile factory hand. Asthma came at any time of the year but was aggravated by cold and dampness or by changes in weather Epinephrin injections caused severe reactions, and ephedrine also produced symptoms There were frequent attacks of bronchitis with fever associated with or following asthmatic attacks In 1928 he was skin tested and given injections of an autogenous vaccine which seemed to make him worse. In 1930 he visited the outpatient department of the Onondaga Tuberculosis Sanitarium Coarse rales were heard in the chest. Two sputums were negative for tubercle bacilli X-ray of the chest showed general increase of lung markings—no evidence of tuberculosis In November and December 1933 he made four visits to the Allergy Clinic of the Syracuse Free Dispensary Intradermal skin tests gave positive reactions to house dust, feathers, cow dander, flaxseed, sheep dander, wheat, chicken, and rye Of late he has gone downhill fairly rapidly, lost weight, and his cheeks have become sunken The asthmatic paroxysms are best relieved by morphine, but the dose has had to be increased to gr 2/3 The effect would not be dramatic but he would get gradual relief from his terrific efforts to breathe and would become relaxed.

Admission examination Temperature 103°, pulse 120, respiration twenty-eight Tall man with hollow cheeks and anxious expression, slight cyanosis and marked asthmatic breathing, looks older than stated age (45) Teeth in poor condition Blood pressure 150/90, heart tones are distant Emphysematous type of chest with depression of lower lateral walls Wheezing rales throughout with occasional moist rales Radial arteries firm Abdomen negative.

April 8 Reds 5,400,000, Hb 100 per cent, whites 6,700, polys eighty per cent, monos twenty per cent, reds appear normal

April 11 Whites 11,300, polys eighty-eight per cent, monos eleven per cent, basophiles one per cent. Fifty per cent of the polys are nonfilamented Urine negative

Chest x-ray Diffuse coarse mottling extending practically from apices to bases, tending to blot out normal lung markings Root shadows heavy on both sides, extending along the larger bronchial trees The reaction has the appearance of nodulation. Pneumoconiosis should be considered. Doubtful if reaction is tuberculous There is unquestionably chronic bronchitis and possibly bronchiectasis Diagnosis deferred.

The patient ran an irregular fever with rapid pulse, labored respirations, and dyspnea He required frequent injections of morphine gr 1/4 for relief He became irrational and would not tolerate an oxygen tent or mask Ether and oil per rectum were unavailing Because of a history of epinepehrin sensitivity a small dose (1 c.c) was administered Succeeding doses were gradually increased by 1 c.c. until a maximum of 9 c.c. was reached No unfavorable effects appeared, but he experienced little relief Marked sweating supervened, the cyanosis increased and he died April 12 (five days after hospital admission)

AUTOPSY BY DR. T C WYATT

External examination Body is that of a fairly well-developed, rather poorly nourished adult male There is a rather marked deformity of the chest with increase in the anteroposterior diameter and a definite fullness of the left side which also shows a Harrison's groove.

Pleural cavities Scattered over the pleural surfaces, particularly of the upper lobes, are several pinhead-sized grayish nodules which in places show definite grouping These are also present over the lower portions of the lungs but in fewer numbers and tending to be single.

Mediastinum Without evident lesion.

Pericardial cavity Without evident lesion

Heart Weight 435 grams Without evident lesion

Lungs Weight of left lung 757 grams, right, 825 grams Scattered throughout the lungs are

daily divided in three doses At present taking sixty-five of protamine once daily before breakfast with absolute control of glycosuria Diet of 130–70–80 No hypoglycemia No ketosis

CASE 19 D S, female, age seventeen Diabetes three years duration Poorly controlled with 104 units daily divided in three doses Perfect control on seventy-five units of protamine once daily before breakfast. Diet of 120–60–100 No reactions No glycosuria

PRIZE AWARD

The rules governing the award of "The Foundation Prize" of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons are as follows

(1) The award which shall be known as "The Foundation Prize" shall consist of $500

(2) Eligible contestants shall include only (a) interns residents, or graduate students in Obstetrics, Gynecology or Abdominal Surgery, and (b) physicians (with an M D degree) who are actively practicing or teaching Obstetrics, Gynecology or Abdominal Surgery"

(3) Manuscripts must be presented under a nom-de-plume, which shall in no way indicate the author's identity, to the Secretary of the Association together with a sealed envelope bearing the nom-de-plume and containing a card showing the name and address of the contestant.

(4) Manuscripts must be limited to 5000 words, and must be typewritten in double-spacing on one side of the sheet. Ample margins should be provided Illustrations should be limited to such as are required for a clear exposition of the thesis

(5) The successful thesis shall become the property of the Association, but this provision shall in no way interfere with publication of the communication in the Journal of the Author's choice Unsuccessful contributions will be returned promptly to their authors

(6) All manuscripts entered in a given year must be in the hands of the Secretary before June 1

(7) The award will be made at the Annual Meetings of the Association, at which time the successful contestant must appear in person to present his contribution as a part of the regular scientific program, in conformity with the rules of the Association The successful contestant must meet all expenses incident to this presentation.

(8) The President of the Association shall annually appoint a Committee on Award, which under its own regulations shall determine the successful contestant and shall inform the Secretary of his name and address at least two weeks before the annual meeting

—JAS R. BLOSS, M D *Secretary*
418 Eleventh Street, Huntington, W Va

ELEVEN AGES OF MAN

First—Milk
Second—Milk and Bread
Third—Milk, bread and spinach
Fourth—Oatmeal, bread and butter
Fifth—Ice cream soda and hot dogs
Sixth—Minute steak, fried potatoes, coffee and apple pie
Seventh—Bouillion, roast duck, escalloped potatoes, creamed broccoli, fruit salad, divinity fudge, demi-tasse
Eighth—Pate-de-foie-gras, weiner-schnitzel, potatoes, Parisian egg plant, a-Yopers, demi-tasse and Roquefort cheese
Ninth—Two soft poached eggs, toast and milk
Tenth—Crackers and milk
Eleventh—Milk

—*Journal of the Michigan State Med Soc*

1000 patients with tuberculosis [illegible] had asthma. In discussing the [illegible] suggested that tuberculosis [illegible] effects in asthma that tuberculosis [illegible] an allergic role in the production [illegible] asthma.

[illegible] emphasizes the [illegible] developing tuberculosis in the lungs [illegible] tuberculosis and emphysema and chronic [illegible] He stresses the slow [illegible] tuberculosis rate in uncomplicated asthma [illegible] and recommends sputum examinations [illegible] every [illegible] asthma patients showing an [illegible] increased sedimentation time.

[illegible] and Heald examined the [illegible] records of 1,000 cases of asthma and [illegible] found in which there was evidence [illegible] pulmonary tuberculosis. Eighteen of [illegible] these cases attended the Clinic with [illegible] a disease said to be careful studied [illegible] All of these were positive skin reactors [illegible] and presented one of their asthma to [illegible] sensitization to the offending protein. The [illegible] remaining cases who were skin negative, [illegible] showed chronic respiratory infections, [illegible] but no signs and could be classified [illegible] as tuberculous asthma. There was no [illegible] evidence to show that tuberculosis played a [illegible] role in the development of asthma.

[illegible] the main subjects and comparing in- [illegible] terpretations of the study of asthma and [illegible] [illegible] with an extensive review of [illegible] [illegible] is presented by Brayton [illegible] [illegible] [illegible] the existing facts on the [illegible] [illegible] [illegible] findings and tu- [illegible] [illegible] reactions. He comments on the [illegible] [illegible] of dealing with asthma the [illegible] [illegible] [illegible] of the chronic phase [illegible]

[illegible] studies gathered from various [illegible] [illegible] show that the presence of [illegible] [illegible] and asthma in the same [illegible] [illegible] less than one in a [illegible] [illegible] [illegible] the incidence of allergic [illegible] [illegible] [illegible] the figures [illegible] [illegible] [illegible] case in [illegible] [illegible] asthma. When [illegible] [illegible] [illegible] cases of [illegible] [illegible] [illegible]

fairly numerous pinhead-sized grayish nodules which in the upper lobes and to a lesser extent in the lower lobes tend to be somewhat grouped to form sizable areas of grayish solidity These areas tend to measure one to two cm in diameter There is no cavity formation and no apparent caseation or calcification The dependent and lower portions of the lungs between the above described areas tend to be uniformly rather firm and dark red in color A rather large amount of grayish frothy fluid and reddish fluid can be expressed from the cut surfaces

Liver Weight 2075 grams Scattered over the surface of the liver are a few rather indistinct pin-point grayish lesions Liver on section is not remarkable

Anatomical diagnosis Areas of tuberculous pneumonia in lungs acute hypostatic pneumonia, a few possible miliary tubercles in liver and kidneys, congestion of brain, deformity of chest, and left inguinal hernia.

MICROSCOPIC DESCRIPTION

Lungs In some of the sections there are rather large areas in which the normal lung structure is replaced almost entirely by conglomerate tubercles in connection with which there is more or less central necrosis and hyalinization, as well as peripheral fibrosis Here and there a surviving air space is found, these tend to be lined with cuboidal epithelium of uniform size and shape and arranged in a single layer In certain sections of lung only an occasional miliary tubercle is seen

Sections of the *large bronchi* show no striking variation from the normal except for a few scattered lymphoid and plasma cells in the submucous layer There are no definite changes in the epithelium and no evidence of an unusual number of eosinophiles

The *smaller bronchi* which are imbedded among alveoli tend to show a definite acute inflammatory process Lumina are filled with an exudate which consists almost entirely of polymorphonuclear leukocytes The epithelium and subepithelial connective tissue show varying degrees of necrosis In places the epithelium is entirely missing In some areas the muscle of the bronchial wall has undergone partial necrosis

Bronchial lymph nodes show a few miliary tubercles

Spleen, liver, kidneys, brain, and meninges show no tubercles

This case, therefore, presents acute tuberculosis in a patient who had suffered with asthma for nearly his entire life of forty-five years In spite of this long history a careful study of the microscopic sections fails to reveal the usual changes noted in bronchial asthma

A wide divergence of opinion exists as to the relationship of asthma and tuberculosis On one hand the conception has been held, particularly abroad, that the two conditions are mutually exclusive and that an asthmatic patient rarely if ever becomes tuberculous Contrariwise, a larger number of Continental writers, particularly in France and Germany, are confident that tuberculosis is a common or even the usual cause of asthma Here in America a median view appears to hold sway, asthma and tuberculosis are believed to be occasionally associated by fortuitous occurrence, not by etiological relationship

Trasoff[1] quotes Duke[2] to the effect that "patients with allergy have a relative immunity to chronic infections as syphilis and tuberculosis, and that in them the disease runs a remarkably favorable course"

Amsler,[3] however, is greatly opposed to the idea that asthma protects against tuberculosis He cites case histories which demonstrate the development of pulmonary tuberculosis in patients who had suffered for years with bronchial asthma Asthmatic patients become so accustomed to coughing and raising that pulmonary tuberculosis may get well under way before it gains recognition Amsler further believes that asthma is usually the sequel of an unrecognized pulmonary tuberculosis

Jacquelin, Turiaf, and Badouin[4] report statistics of 200 cases of asthma, of which twenty-three per cent showed evidence of tuberculosis They refer to what they call the classical conception of Bezancon and de Jong[5] that tuberculosis of the lungs has a local irritant action on the respiratory passages which, in individuals with a suitable hereditary diathesis, causes the development of bronchial asthma For therapy they advise the intravenous administration of gold and sodium chloride dissolved in ten per cent calcium gluconate solution They believe that in certain tuberculous patients the intensity of the asthma depends upon faulty hygiene brought about by suralimentation (abuse of eggs and fats, especially cod-liver oil), forced inactivity, and lack of exercise

Girbal[6] separates asthma caused by a tuberculous infection from asthma developing in the course of pulmonary tuberculosis In the former case asthma is produced by a latent tuberculosis The patients are asthenic, thin and pale, with slender chests, dilated subclavicular veins, slight tachycardia, hypotension, and slight elevations of temperature He presents

DISTRIBUTION OF TYPES OF PNEUMOCOCCI

In Specimens from Normal Individuals and from Patients Having Pneumonia

JOSEPH SCHLEIFSTEIN, M D, *Albany*
From the Division of Laboratories and Research, New York State Department of Health

The purpose of this study was to obtain information concerning the distribution of types of pneumococci in the throats of normal individuals and in the sputum of patients having pneumonia, in order to evaluate the significance of types other than I, II, and III

It has been known for many years that pneumococci are present in the throats of a large percentage of normal individuals This fact was given added significance by the work of Dochez and Gillespie[1] on the classification of pneumococci, published in 1913 Epidemiological studies of lobar pneumonia by Stillman,[2 3] Rosenau, Felton, and Atwater,[4] and Powell, Atwater, and Felton[5] have demonstrated that almost every individual is a carrier of pneumococci at some time during the course of a year The carrier rate has been shown to be from forty to nearly one hundred per cent, depending upon seasonal variations and the frequency with which the examinations were made Type I and II pneumococci are rarely found in the throats of normal persons who have not been in contact with pneumonia patients, while type III is frequently demonstrated Unclassified strains designated as group IV are present in about fifty per cent of all individuals

After Cooper and her colleagues[6 7] demonstrated that group IV could be divided into a large number of types, the need for information in regard to the incidence and distribution of these types became apparent.[8 18] Most authors, while differing as to the relative frequency with which types IV to XXXII occur in cases of pneumonia, agree, in general, that many of them are present in sufficient numbers to be of significance

In our investigation, specimens were collected from members of the laboratory staff who were not ill A brief history with particular reference to colds, pneumonia, sinusitis, and tonsillitis was obtained Inquiry was also made concerning contact with known cases of pneumonia Physical examination was limited to the nasopharynx, special attention being given to the condition of the mucosa and tonsils Swabbings were obtained from the nasopharynx and from both tonsils

Blood-agar plates were inoculated from the material collected on the swabs The swabs were then placed in Avery's broth and incubated for from four to seven hours at 35-37°C After the red blood corpuscles were removed, the cultures were centrifugalized Mice were inoculated with some of the sediment and the remainder was examined by the Neufeld method Peritoneal exudates from the mice dying spontaneously, as well as from those chloroformed after forty-eight hours, were also examined for types of pneumococci Cultures were prepared from the peritoneal exudates and from the heart's blood of all the mice The cultures were studied for colonial characteristics and bile solubility and were typed by the Neufeld technic. Strains which proved to be atypical or were nonvirulent for mice are still under investigation

Of 100 individuals studied, seventy-three were found to harbor pneumococci in their throats—thirty-two a single type and forty-one two or more One hundred and thirty-two strains were present, but only eighty-four could be classified and of the latter, fifty-two were isolated In fifteen instances, a *Quellungsreaktion* was obtained in pooled sera, but the pneumococci were present in such small numbers that identification was not attempted Thirty-three cultures which were bile soluble could not be classified Five of them were mucoid strains, apparently belonging to a single type, which could not be identified with the sera available The types that predominated were III, VIII, and XXI The pathogenicity for mice of strains of the two former types may have a bearing on the frequency with which

Read at the meeting of the New York State Association of Public Health Laboratories, Binghamton, May 10, 1937

case of asthma occurring during the course of pulmonary tuberculosis, the latter plays a nonspecific role, similar to influenza, pneumonia, etc which produces the necessary tissue damage for sensitization and asthma to appear Since asthmatic symptoms occur in less than one per cent of tuberculous cases he considers the tubercle bacillus *per se* a poor sensitizing agent He quotes the suggestion of Malone[14 15] that secondary bacterial invaders may be the source of the sensitizing proteins Usually, however, Bray has found the common inhalants to be the offenders When these were eliminated and desensitization instituted, the asthma was usually relieved

An examination of the records of the Allergy Clinic, which was opened at the Syracuse Free Dispensary four years ago, showed eighty-six patients with asthma who had an x-ray examination of the chest By careful examination and reexamination of the films it was found that thirteen patients or 15 1 per cent presented evidence of past or present tuberculosis Most of them would have been missed without an x-ray study At the Onondaga (Tuberculosis) Sanitarium, just outside of Syracuse, among the last 3,712 patients discharged from the hospital, twenty-two cases of asthma were recorded

Discussion

The recognition of pulmonary tuberculosis occurring in the course of bronchial asthma is often difficult, many cases are missed Chest roentgenograms and sputum examinations are usually essential An estimation of the sedimentation rate may be helpful

No convincing evidence has been brought forward to prove that tuberculosis is an important or frequent cause of asthma Although tuberculous changes, usually inactive, are not infrequently found in the lungs of asthmatic patients we have little reason to believe that an etiological relationship exists Infectious asthma caused by bacterial allergy resulting from chronic respiratory infections—usually with pyogenic organisms—is admitted by most allergists It might therefore be reasoned that the great chronic respiratory infection—tuberculosis—could likewise produce the type of tissue sensitization which can result in bronchial asthma This may still be shown to be true, for the final word on this subject has not been spoken, but the evidence assembled to date makes us feel that we cannot consider tuberculosis an important factor in bronchial asthma

DOCTORS REVOLT AT 'GIN MARRIAGES'

The Medical Society of Lake County, Indiana, has unanimously voted a resolution calling on the state authorities for legislation to halt the "gin marriages" that are making the county notorious Lake County, it seems, adjoins Cook County, Illinois, where Chicago is located, and where a medical examination is required for a marriage license.

To dodge this, there is a huge hegira of careless couples across the border into Lake County to assume the so-called holy bonds of matrimony, many of them so befuddled with drink that they do not know what they are about, as they testify later in the divorce court. The *Journal* of the Indiana State Medical Society says that the various clerks and factotums who "solemnize" the marriages have turned the business into a racket, charging and pocketing all kinds of extra and irregular fees

DISTRIBUTION OF TYPES OF PNEUMOCOCCI

In Specimens from Normal Individuals and from Patients Having Pneumonia

JOSEPH SCHLEIFSTEIN, M D, *Albany*
From the Division of Laboratories and Research, New York State Department of Health

The purpose of this study was to obtain information concerning the distribution of types of pneumococci in the throats of normal individuals and in the sputum of patients having pneumonia, in order to evaluate the significance of types other than I, II, and III

It has been known for many years that pneumococci are present in the throats of a large percentage of normal individuals This fact was given added significance by the work of Dochez and Gillespie[1] on the classification of pneumococci, published in 1913 Epidemiological studies of lobar pneumonia by Stillman,[2 3] Rosenau, Felton, and Atwater,[4] and Powell, Atwater, and Felton[5] have demonstrated that almost every individual is a carrier of pneumococci at some time during the course of a year The carrier rate has been shown to be from forty to nearly one hundred per cent, depending upon seasonal variations and the frequency with which the examinations were made Type I and II pneumococci are rarely found in the throats of normal persons who have not been in contact with pneumonia patients, while type III is frequently demonstrated Unclassified strains designated as group IV are present in about fifty per cent of all individuals

After Cooper and her colleagues[6 7] demonstrated that group IV could be divided into a large number of types, the need for information in regard to the incidence and distribution of these types became apparent.[8 18] Most authors, while differing as to the relative frequency with which types IV to XXXII occur in cases of pneumonia, agree, in general, that many of them are present in sufficient numbers to be of significance

In our investigation, specimens were collected from members of the laboratory staff who were not ill A brief history with particular reference to colds, pneumonia, sinusitis, and tonsillitis was obtained Inquiry was also made concerning contact with known cases of pneumonia Physical examination was limited to the nasopharynx, special attention being given to the condition of the mucosa and tonsils Swabbings were obtained from the nasopharynx and from both tonsils

they were isolated While type XXI was found in ten specimens by the Neufeld method, none of the strains were isolated Four strains of type II were identified but only one was isolated Apparently the pneumococci were present in such small numbers that they were overgrown by other bacteria The only types not encountered in specimens from normal individuals were I, V, IX, XIV, XXIV, XXV, XXVII, and XXVIII It is of interest that Harris and Ingraham,[17] while studying carriers of type II pneumococci, also did not find types I, V, and XIV among the 142 individuals examined

A study was made of swabbings from both nostrils of forty of the 100 individuals and pneumococci were found in only one instance This seemed an interesting observation in view of the frequency with which these micro-organisms were present in the throat

It might be mentioned, incidentally, that during the course of the investigation, type I pneumococci were isolated from a person with a severe cold She did not have pneumonia and was able to attend to her duties Pneumococci were not found in a specimen collected after recovery from the "cold"

From September 1, 1936 to April 1, 1937, in the examination of 250 specimens of sputum submitted for pneumococcus-type differentiation, 277 strains of pneumococci were found, all but six (two per cent) of which could be classified This low percentage of unclassified strains was in marked contrast to thirty-six per cent which could not be classified in the series of strains harbored by normal persons In 231 specimens, one type was found, in nineteen, two, and in two, three Eighty per cent of the strains belonged to types I, III, VIII, V, IV, II, VII, VI, XV, XXXI, and XIV The frequency of occurrence was in the sequence shown The incidence of types I to XXII, with the exception of types VII and XIV, corresponds very closely with the findings of Bullowa and Wilcox[18] (Table I)

Summary and Conclusions

Of 100 normal individuals who had not been in contact with pneumonia patients, seventy-three per cent were found to be carriers of pneumococci and over fifty per cent harbored micro-organisms of two or more types

The incidence of the strains of the various types is compared with those found in specimens of sputum from patients with pneumonia Type I, which heads the list of incitants of pneumonia, was not found in specimens from normal persons Types V and XIV, not infrequently present in specimens from patients with pneumonia, also were not encountered in those from persons who were not ill Types III and VIII, which were present in considerable numbers in both groups, are markedly pathogenic for mice This factor may have a bearing on the number isolated

The series of specimens included in this study is small, but the findings suggest that continuation of the investigation is warranted

AMERICAN COLLEGE OF SURGEONS MEETING

The Great Lakes Sectional Meeting of the American College of Surgeons, including Ontario, Quebec, and the states of New York, Ohio, Michigan and Pennsylvania, will be held in Toronto, Ontario, on March 22, 23, and 24 The headquarters will be at the Royal York Hotel A most active Committee on Local Arrangements, headed by Dr W Edward Gallie, is making excellent plans for this meeting There will be an exceptionally interesting program consisting of clinics, scientific sessions, hospital conferences, medical motion pictures, and other features during the meeting A visiting group of ten or twelve outstanding surgeons will be present to participate in this program

A general outline of the program is as follows

March 22

8 00–9 00 Registration and general information for Fellows of the College, hospital representatives, and guests
9 00–12 00 Operative and non-operative clinics, surgery and the surgical specialties, local hospitals
10 00–12 30 Hospital conference.
2 00–4 30 Hospital conference
2 30–4 30 Medical motion pictures 1 General surgery 2. Eye, ear, nose and throat surgery
4 30–5 00 Annual meeting, Fellows of the College
6 30–8 00 Medical motion pictures, general surgery
8 00–10 00 Scientific meeting, general surgery
8 00–10 00 Medical motion pictures, eye, ear, nose and throat surgery
8 00–10 00 Hospital conference

March 23

8 00–9 00 Registration and general information for Fellows of the College, hospital representatives, and guests
9 00–12 00 Operative and non-operative clinics, surgery and the surgical specialties, local hospitals
10 00–12 30 Hospital conference.
1 00–2 00 Medical motion pictures, general surgery
2 00–5 00 Scientific meeting, general surgery
2 00–5 00 Scientific meeting, eye surgery
2 00–5 00 Scientific meeting, ear, nose and throat surgery
2 00–5 00 Hospital conference
6 30–8 00 Medical motion pictures, general surgery
8 00–10 00 Scientific meeting, general surgery
8 00–10 00 Scientific meeting, eye surgery
8 00–10 00 Scientific meeting, ear, nose and throat surgery
8 00–10 00 Motion pictures for hospital representatives

March 24

8 00–9 00 Registration and general information for Fellows of the College, hospital representatives, and guests
9 00–12 00 Fracture clinic
9 00–12 00 Operative clinics, eye, ear, nose and throat surgery
10 00–12 30 Hospital conference
2 00–5 00 Scientific meeting (panel round table conference, eye surgery)
2 00–5 00 Scientific meeting (panel round table conference), ear, nose and throat surgery
2 00–5 00 Cancer clinic
2 00–5 00 Hospital conference
8 00–10 00 Medical motion pictures, general surgery
8 00–10 00 Community health meeting

This meeting will be of interest not only to Fellows of the College but to the medical profession at large, as well as to hospital trustees, superintendents, nurses and hospital personnel Members of the State Medical Association are most cordially invited to attend There will be no registration fee

point to become embedded The position of the pin will thereafter remain unchanged In the tracheobronchial tree, the shortening and lengthening which accompanies respiration will produce the same result As a rule, however, a pin which is wide open will be arrested in the larynx if it should be carried into it, and a pin which is only slightly open will fall into one of the branch bronchi before it is brought to rest To summarize pins in the esophagus lie in the lateral plane, pins in the tracheobronchial tree lie in or near the sagittal plane In both instances, the keeper extremity is applied to one wall of the lumen and the pointed extremity crosses the lumen and is embedded in the opposite side With these facts in mind, the endoscopist is enabled to visualize in advance the position of the foreign body and to deduce at once the location of all other parts of the pin as soon as any portion of it presents through the instrument

One other contingency must always be kept in mind, especially in children They are very unlikely to remove a pin manually from their own mouths It is, moreover, not uncommon, that more than one pin may enter the mouth at the same time and violent movements of the tongue may force the pin, or one of the pins, into the posterior nares, where it would be hidden

Fig 1 X-ray of lower abdomen of child who stated she had 'sewing machine needle stuck in her throat." X-ray was negative. This figure shows shadow of sewing machine needle in upper pelvic basin, and also common pin at intervertebral disk between third and fourth vertebrae

THE OPEN SAFETY PIN

MILTON SILLS LLOYD, M D, *New York City*

A number of years have passed since Jackson[1] described his sixteen methods for the removal of a safety pin from the air and food passages The warning which he issued at that time, that every safety pin must be treated as an individual problem, applies, however, with equal force today Medical failures are, unfortunately, too infrequently reported, but deaths, as a result of attempted removals of the open safety pin, are known to occur with sufficient frequency to keep us alert to the dangers of this problem

Although every safety pin presents individual difficulties which must be worked out with strict regard to the case at hand, there are, at the same time, a number of pertinent and valuable facts which may be observed with sufficient regularity to establish their usefulness as a basis for general considerations When a safety pin enters the mouth, it is placed between two surfaces one of which is fixed and the other mobile In adults, the individual may remove the pin from his own mouth by means of the fingers when it can be reached in this way In such instances, the fixed surface may be said to begin with the posterior pharyngeal wall and the mobile surface, at a point on the dorsum of the tongue correspondingly opposite As far as the further progress of the pin into the body is concerned, these two surfaces may be said to continue downward until the constrictor pharyngeus inferior muscle is passed In infants and very young children, on the other hand, these two surfaces act in the same mechanical way, beginning with the palate and proceeding backward and downward to the same level If the pin enters the mouth, as it usually does, due to its triangular shape, with the point directed outward, attempts to eject it by movements of the tongue will serve generally to carry it further downward When the tongue is drawn inward, with the purpose of placing it behind the pin, the point is caught on its rough surface and the pin is carried backward In this way, the "keeper" extremity of the pin is thrown outward and applied to the wall of the mouth or throat When the tongue is moved forward in preparation for the next similar attempt, it slides over the pointed extremity and catches it again on the next backward movement Since the keeper extremity is smooth throughout, it slides easily along the mucosal surface In this way, the pin is quickly forced into the position in relation to the surrounding structures which it is eventually to assume This position is, with minor variations, as follows the keeper extremity, from the ring outward, is applied to the posterior fixed surface, while the pointed extremity crosses the lumen of the passageway and is embedded in the anterior mobile surface

After the pin has passed the soft palate, the immediate succession of events will decide whether it is to enter the trachea or the esophagus The trachea is the ultimate destination in children when the pin is dropped far back into the mouth and produces an immediate and violent cough reflex, and in adults when a pin held in the mouth is suddenly thrown backward by gasping or a quick movement resulting from surprise or fright In such instances, the mouth is opened and a sudden forced inspiratory movement is made and the pin is drawn into the trachea with the rush of air In entering the trachea, it is forced into the sagittal plane by the vocal cords, and continues to occupy this relative position

On the other hand, a pin that works its way gradually backward as a result of the forces described above, will enter the esophagus The walls of the esophagus will force it into the lateral plane and it will continue thereafter to occupy this relative position Most pins will fail to negotiate the anterior curvature of the upper esophageal lumen, corresponding to the direction of the lower cervical and upper thoracic segments of the vertebral column, which present the greatest anterior prominence at the same level as the narrowing produced by the constrictor pharyngeus inferior muscle In the esophagus, the peristaltic movements of the muscle will either carry the pin downward by pressure on the point or cause the

point to become embedded The position of the pin will thereafter remain unchanged In the tracheobronchial tree, the shortening and lengthening which accompanies respiration will produce the same result As a rule, however, a pin which is wide open will be arrested in the larynx if it should be carried into it, and a pin which is only slightly open will fall into one of the branch bronchi before it is brought to rest. To summarize pins in the esophagus lie in the lateral plane, pins in the tracheobronchial tree lie in or near the sagittal plane In both instances, the keeper extremity is applied to one wall of the lumen and the pointed extremity crosses the lumen and is embedded in the opposite side With these facts in mind, the endoscopist is enabled to visualize in advance the position of the foreign body and to deduce at once the location of all other parts of the pin as soon as any portion of it presents through the instrument

One other contingency must always be kept in mind, especially in children They are very unlikely to remove a pin manually from their own mouths It is, moreover, not uncommon, that more than one pin may enter the mouth at the same time and violent movements of the tongue may force the pin, or one of the pins, into the posterior nares, where it would be hidden

Fig 1 X-ray of lower abdomen of child who stated she had sewing machine needle stuck in her throat" X-ray was negative. This figure shows shadow of sewing machine needle in upper pelvic basin, and also common pin at intervertebral disk between third and fourth vertebrae

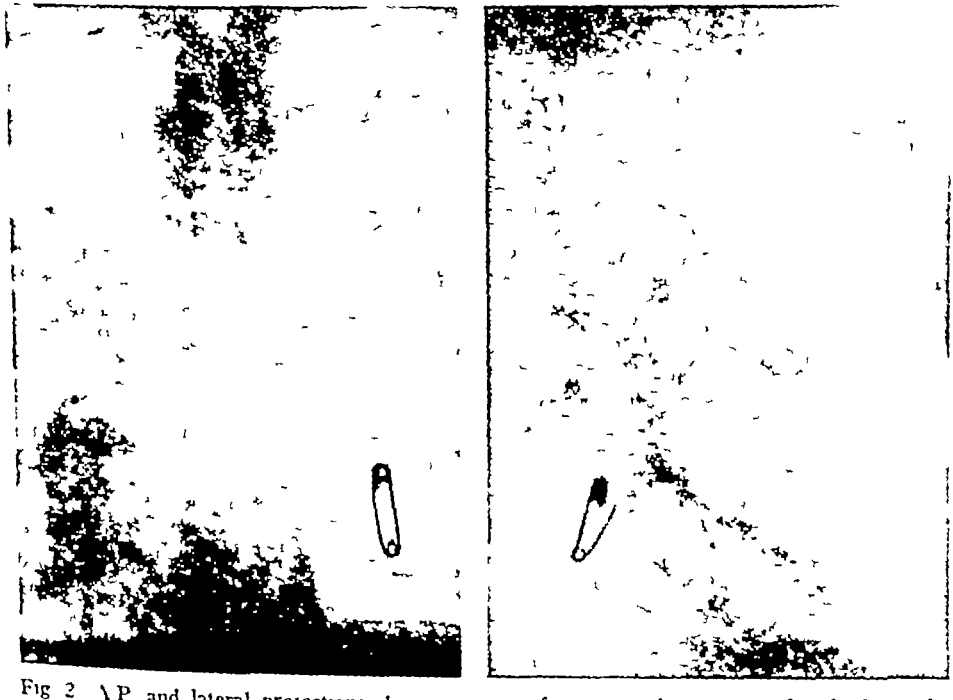

Fig 2 A P and lateral projections showing open safety pin in lower part of right lung, the point directed anteromedially (Case 1)

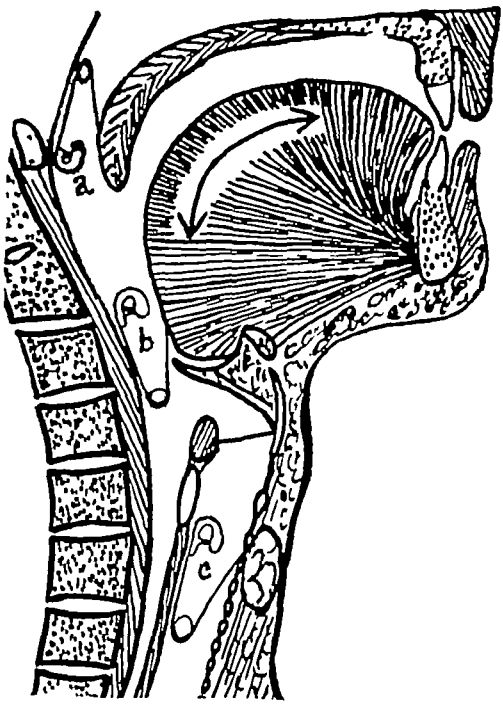

Fig 3 Position of safety pin in (a) posterior nares, (b) entrance to esophagus, (c) upper end of trachea

from view by the soft palate It may also happen in children that one pin may enter the trachea and another pass down the esophagus as far as the stomach Consequently, it is advisable, in making the diagnostic x-ray, to adhere to the rule which is now followed in every bronchoscopic clinic and expose the entire respiratory and digestive tracts from the nose to the pubic arch (Fig 1)

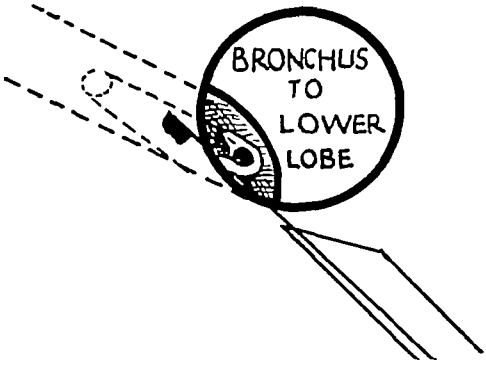

Fig 4 Diagrammatic drawing of safety pin in mediastinal branch of right lower lobe. Keeper only is visible. Forceps passed below keeper (Case 2)

In the further preparation of the case, careful attention to detailed diagnosis will be rewarded Oblique x-rays will demonstrate the exact direction of the point and also the distance separating the point from the keeper, due allowance having been made for distortion by the rays A knowledge of this factor alone may decide between success and failure when the extraction of the foreign body is actually undertaken (Fig 2)

The problem presented by the open safety pin depends upon its location—airways or esophagus, stomach or intestine In the first two locations, its removal is indicated, and can generally be accomplished under direct vision by an electrically lighted endoscopic tube By the time the pin has reached the stomach, this

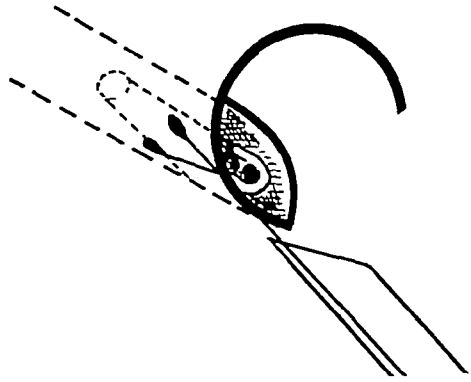

Fig 5 Same as Fig 4 showing forceps' blades after rotation (see text) ready to grasp pointed end of safety pin

procedure is no longer possible In institutions with the proper equipment, the best recourse is then to the Tucker flexible gastroscopic forceps, manipulated under the guidance of the biplane fluoroscope

The removal of an open safety pin in any part of the stomach is generally possible by this method, with proper equipment in trained hands Where, however, equipment is lacking, and the necessity or advisability of open operation presents itself, the surgeon should proceed with the full consciousness that the greatest risk is involved by opening the gastric wall This need not be done, and lives will be saved if it is not done The necessity may be circumvented by two methods (1) When the abdominal wall has been opened, the pin may be located in the

stomach and closed by manipulation through the gastric wall Unless the pin is large, it will pass on in the natural course of events without injury If the pin is large, in comparison to the patient's age and the acuity of the curvature of the duodenum, it is safer and comparatively simpler to follow the second course (2) While the patient is under anesthesia, the pin is maneuvered through the gastric wall until it is brought into such a position that it is visible to the gastroscopist It may then be seized under direct vision and removed with a gastroscope The abdominal incision, in either case, may then be closed without the risk of peritonitis or adhesions

In case the pin has passed beyond the pylorus, it should be observed at twenty-four hour intervals with the fluoroscope, and its position marked with ink on the body wall Failure to show evidence of movement over a period of forty-eight hours is an indication for open operation In practically all of these cases, the simple closure of the pin *in situ* is sufficient to insure its delivery with the intestinal contents It is not necessary to manually propel the foreign body from the small to the large intestine, or from the large intestine to the sigmoid colon Such a manipulation tends to paralyze the intestinal musculature It leads to meteorism, reverse peristalsis and postoperative vomiting—all of which delay the ejection of the foreign body, rather than advance it

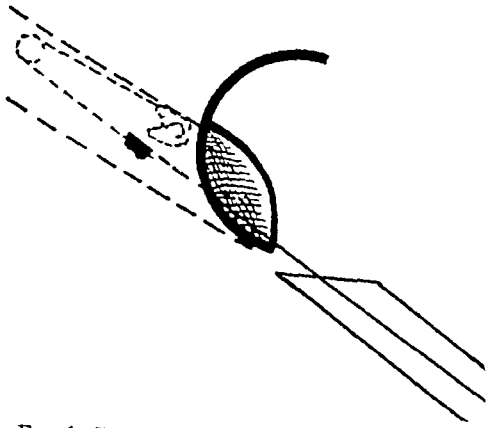

Fig 6 Point of safety pin grasped in forceps, disembedded by displacement downward and brought into line with shank of forceps by Tucker blades

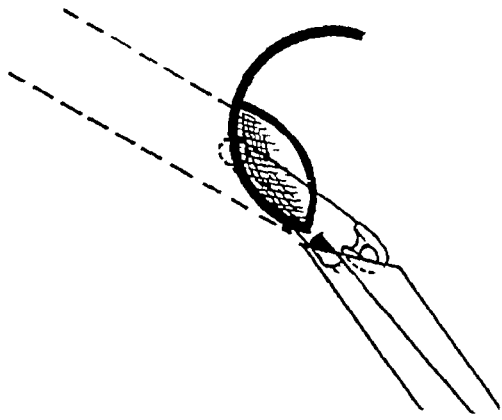

Fig 7 Extraction of safety pin begun with pointed extremity inside mouth of bronchoscope

In the following case reports, the technic employed for a successful removal illustrates the value of being prepared with an accurate study of the case, on one hand, and also of being prepared for the individual or unexpected difficulty on the other

Case Reports

Open Safety Pin in the Right Lung for 32 Months

CASE 1 N M, white female, seventeen years of age, was suffering from cough, afternoon fever, loss of weight, and wheezing sounds in the chest. She consulted her physician (Dr H A Cochrane), who ordered an x-ray, under suspicion of tuberculosis The x-ray revealed the presence of an open safety pin in the right bronchus, point upward

The patient recalled having "swallowed" it nearly three years previously

She was admitted to St. Vincent's Hospital, Staten Island, on May 15, 1936 Except for a temperature of 99.2°F, and limitation of movement on the right side, the physical examination revealed nothing of importance

On May 16, under local anesthesia, a seven mm bronchoscope was passed The pin was located between the upper and middle lobe branch bronchi It was completely buried in granulation and fibrous tissue, and the bronchus was almost occluded in the remainder of its lumen by heavy mucous secretion After careful removal of the secretion, the margin of the keeper became visible on the lateral side An attempt to expose the point resulted in slight extravasation of blood It was then attempted to bring the point into view by exerting pressure on the keeper with the tip of the bronchoscope.

This, however, dislocated the pin from the encapsulating fibers and forced it downward into the lower portion of the bronchus The field was again cleared up, but the pin was not visible, and the patient was returned to the ward for further x-ray study

Anteroposterior and lateral views showed the pin to be then in the mediastinal branch of the right lower lobe, the point directed anteromedially Thirty-six hours after the first bronchoscopy, a second examination was made After considerable difficulty, a small portion of the keeper was brought into view The point was invisible A Tucker pin forceps was introduced to avoid the keeper (Fig 4) When the blades had passed beyond the keeper, they were opened, the shank was rotated one-half turn in a clockwise direction (Fig 5) in order to separate the pin point from the bronchial wall, and the blades were closed Forceps and pin were forced downward about one-quarter inch, in order to disembed the point (Fig 6) When traction was begun, the keeper was seen to move upward The bronchoscope was held in such a position as to maintain the bronchial orifice in the center of its lumen Further traction completed its removal through the bronchoscope (Fig 7) When the nurse removed it from the blades of the forceps, it broke into two portions at the ring The pin measured twenty-eight mm from keeper to ring

The patient's further recovery was without incident, and she was discharged on May 18

The bronchoscopic maneuver reported in the above case was carried out without fluoroscopic control because the advisability of biplane fluoroscopy was not anticipated Under such circumstances, there is no reason why a difficult manipulation should not be attempted so long as the operator bears in mind the Jackson aphorism "If you can't do any good, at least do no harm"

Open Safety Pin Removed from Stomach

CASE 2 J R, white male, six months, admitted to Staten Island Hospital, January 7, 1935 and discharged the following day The mother stated that while dressing the infant, it swallowed an open safety pin The x-ray showed the pin open, point upward, about the middle of the esophagus A seven mm esophagoscope was passed without anesthesia As the pin was approached, and the esophageal lumen was widened, it began to descend toward the stomach The esophagoscope was inserted as rapidly as the pin descended, so as to keep it constantly in view, hoping that at the diaphragmatic pinchcock it would come temporarily to rest In spite of the fact that the pin was large, this did not occur It proceeded at the same pace into the stomach The esophagoscope was then passed between the shafts of the pin and, as soon as it entered the stomach, it was carried forward on the end of the tube until the gastric wall on the cardiac portion of the greater curvature was reached Momentarily, the foreign body was lost to view in the folds of the gastric mucosa It could still be felt, however, in contact with the end of the tube By careful manipulation, the pointed shank was again brought into view It was followed backward until the ring could be seen This portion of the pin was then grasped by rotation forceps, the pin was inverted and withdrawn ring upward through the esophagoscope

The patient suffered a slight reaction, and on the following day the temperature rose to 100 6°F The mother, however, insisted on removing the infant against advice A few weeks later, he was seen in the hospital dispensary in a perfectly healthy state

MOST VALUABLE ASSET LOST

Having witnessed socialized medicine during his stay in Vienna, Dr Aaron Kramer of Brooklyn, arriving on the *Conte de Savoia* recently, said he hoped he would never be a party to it in this country

In an interview he told of the disintegration of private practice in Austria through socialized medicine He said it was appalling to see the biggest professors and specialists waiting in their offices day after day for patients who never came

"Why should they come when they can get the doctor's service in the clinic free?" he queried To supplement the small wages paid them by the government Viennese professors are only too glad to tutor American doctors seeking postgraduate studies

According to Dr Kramer, the profession in Austria has lost the most valuable asset in the cure of human ills—the personal relationship between doctor and patient

"When hundreds of people come to clinics to be treated for colds treatment becomes mechanical The doctor loses interest and there is no incentive for further self-development and improvement," he said

GYNECOLOGICAL MORBIDITY AND MORTALITY

Analysis at Harlem Hospital—1936

PETER MARSHALL MURRAY, M D , ScD , *New York City*
Visiting Gynecologist, Harlem Hospital (Dr H C Falk, Director)

The late Dr John O Polak very wisely said, "We all like to report our successes but it is from our failures that we learn our short comings and the lessons which should be indelibly impressed upon our memories" If we are wise every failure should teach us a very valuable lesson from which every future patient will benefit

Fully appreciating and accepting this philosophy it is the practice on the Gynecological Division of Harlem Hospital to carefully and fully record in what we are pleased to call a "Calamity Book," every death, every infection, every complication, and the details of every interesting and unusual case for ready access and periodic study This practice has proved of very great value to us in keeping alive a healthy discontent in our work and is a constant challenge to improve our results

It is unnecessary to state that the generally accepted minimum preoperative requisites for gynecological surgery, are scrupulously observed Conservatism is the ruling principle on our service Our objective is to return our patients to their usual routines of life as near as possible anatomically corrected, clinically relieved or cured, and economically efficient

From January 1 to December 31, 1936, there were 1,255 cases admitted to the Gynecological Division of Harlem Hospital Of these, 440 were submitted to some form of surgical treatment, an operative incidence of 35 08 per cent The total number of deaths for the same period was thirty-five Five of these deaths were non-gyn , giving a corrected total of thirty deaths or 2 39 per cent Autopsies were performed on eighteen cases or 51 4 per cent

In the nonoperative group of 815 cases, there were twenty-two deaths or 2 69 per cent Autopsies performed in this group were sixteen or 72 7 per cent

In the operative group 440 cases there were eight deaths or 1 81 per cent There were two autopsies or 25 per cent

There were 353 laparotomies, with infected wounds in eighteen cases, or 5 09 per cent

There were eighty-seven operations of vaginal or other type

These operations were performed by twenty-two men, all members of the Visiting or House Staff The largest number, 149 laparotomies and forty-seven vaginal operations (total of 196) were performed by the House Gynecologist under proper supervision

The total number of abortions admitted during this period was 287, of which thirty were curetted There were twelve deaths among the abortions, a rate of 4 18 per cent All of the deaths among the abortions were nonoperative

Thirty-two ectopic pregnancies were admitted during this period The diagnosis was made and not found in seven cases The diagnosis was not made and found in two, the diagnosis was made and found in thirty cases There were no deaths among the ectopics

Seven hundred and fifty-five cases returned for follow-up examination The percentage of those requested to return was seventy-two per cent

Analysis of Eight Operative Deaths

These eight patients were operated on by seven different surgeons

CASE 1 A thirty year old colored nullipara was admitted January 27, 1936, complaining of prolonged menorrhagia and abdominal cramps Her menses were irregular occurring for the past four years q two or three weeks and never flowing less than eight days, accompanied by cramps She admitted one induced miscarriage Examination revealed an irregularly enlarged nodular uterus about ten cm in its greatest diameter There were no other pelvic masses Her general condition was fairly good Heart and lungs negative B P 156/110 Urine negative Rbc 3½ million, Hgb sixty per cent Wbc 8,800 Polys eighty-two per cent, lymph eighteen per cent Sedimentation rate ten mm in

sixty minutes On Feb 8 under avertin-ether anesthesia, laparotomy revealed a multinodular fibroid uterus The omentum, broad ligaments, cul-de-sac anterior abdominal wall, as well as the mesoappendix were studded with firm, pearly discrete nodules of fibromatous consistency A supracervical hysterectomy was done with removal of both tubes and ovaries Patient died from a generalized peritonitis on the fourth postoperative day after a simple laparotomy with almost no postoperative shock Autopsy disclosed purulent peritonitis, infection of incisional wound, and pulmonary edema

CASE 2 A thirty-six year old III-gravida, II-para, was admitted January 28, 1936, complaining of severe cramps in lower abdomen She admitted an induced abortion in July 1935, since which time she had lost forty pounds in weight. No menstrual abnormality There was a nonproductive cough for the past week The patient was extremely emaciated Heart negative X-ray of chest showed no abnormality of lungs The abdomen was distended, somewhat soft, with a sensation of cystic mass filling the left side of abdomen and bulging in left flank There was flatness on percussion over this mass with fluid wave through it There was no shifting dullness Urine was negative Blood chemistry was Creatinin 1 4, Urea N 13 0, Sugar 128 Rbc 3,800,000, Hgb seventy per cent, Wbc 23,400, Polys eighty per cent, lymphs sixteen per cent.

Preoperative diagnosis Tuberculous peritonitis, infected ovarian cyst, and tuberculous pyosalpinx Laparotomy on Feb 6 disclosed a large pus sac filling the lower abdomen, with adhesions to omentum and small intestine Aspiration by suction removed about one gallon of yellowish pus with B coli odor This proved to be a large pyosalpinx Because of the difficulty in separating adhesions from intestines, the lower part of this mass was caseous and necrotic, and because of poor condition of patient, portion of the sac was removed and the remainder was marsupialized and sutured to anterior abdominal wall The abdomen was drained and closed Patient left table in poor condition

Postoperative diagnosis Giant tb pyosalpinx Pathological report showed wall of abscess with areas of caseation and giant cells present Her postoperative course was stormy from the beginning, temperature rising to 103° F on the third day On the fourth day she was transfused, but this was of no avail and patient gradually sank, until she died on the fifth day postoperative No autopsy

CASE 3 A twenty year old colored female was admitted June 16, 1936, complaining of pain in the lower abdomen, backache, and fever Attack began six days previously Has had a vaginal discharge for the past year and occasional burning on urination Complains of frequency at present. Has had attacks of lower quadrant pain every year since 1931 Last menstrual period was May 18, menses occasionally come twice a month Pregnancies denied Examination revealed a tender lemon-sized mass in the right fornix, lying in front of the fundus Patient had been operated on three times for mastoid infections in 1932 and 1936 Heart and lungs showed no abnormal findings B P 124/86 Urine 1+ albumin and occasional pus cells Rbc 4,100,000, Hgb sixty per cent, Wbc 11,650, Polys eighty two per cent, lymphs eighteen per cent Kahn test negative Laparotomy performed June 30 revealed right adnexal disease with firm adhesions to posterior surface of broad ligament. The appendix formed a part of the mass In separating the appendix from the mass, a fair-sized fecalith was extruded into the pelvis Simple appendectomy was done with penrose drainage of the abdomen The postoperative course was stormy from the beginning Pulse and temperature increased rapidly, and on July 4 there were signs of generalized peritonitis and 103 temperature One week later she developed a cellulitis of floor of mouth and ulcerating stomatitis Mouth and throat swab showed fusiform Bacilli of Vincents In addition to supportive treatment, infusions, and transfusions, neoarsphenamine locally to mouth lesions Pulse continued above 130, temperature from 100 to 104 Blood culture negative Patient died on July 23, mainly, we believe, from the fulminating mouth infection No autopsy

CASE 4 A twenty-five year old colored woman was admitted June 6, 1936, complaining of pain in lower abdomen, chiefly in right lower quadrant, and fever of one week's duration She had experienced several similar attacks during the past year Three children, the youngest of which was five years

Menses regular, of q twenty-eight day type, three days duration Last period began one week before admission and coincided with beginning of present illness

Examination Heart and lungs essentially negative Abdomen protuberant A large ovoid mass of cystic consistency filling right side of abdomen and extending to within two fingers of the umbilicus Cervix was pushed up under symphysis by this mass which filled posterior and right fornices A smaller mass was present in the left fornix The rectovaginal septum was

thickened and indurated and exquisitely tender Urine examination was negative and blood chemistry within normal limits, but temperature spiked between 100 and 104 Sedimentation time repeatedly rapid A posterior colpotomy was done on June 21 yielding no pus The patient continued to spike and the masses enlarging and filling the abdomen to the umbilicus Six days later a bilateral extraperitoneal drainage was done leaving four penrose drains in either side, about Poupart's ligaments On the ninth postoperative day there was drainage through both extraperitoneal openings and the temperature receded to 99 On the thirteenth day, temperature was flat. On the sixteenth day patient suddenly became drowsy and looked toxic, with temperature rising to 101 6, and a thready pulse Third operation was then done for abscess of rectovaginal septum, the colpotomy yielding about a pint of pus From this point patient gradually grew weaker and died from chronic sepsis on the eleventh day after last colpotomy Autopsy revealed a pelvic abscess, left parametric abscess, right tubo-ovarian abscess, and right hydronephrosis

CASE 5 A forty-five year old colored woman was admitted July 22, 1936, with complaints of menorrhagia and mass in abdomen Two miscarriages preceded birth of only child in 1923 Patient was told two years ago that she probably had a fibroid uterus Menses usually eight days, but beginning March 1936, periods began to be prolonged lasting as long as two weeks, and associated with abdominal cramps

Examination showed patient in good general condition Heart and lungs essentially negative Urine 1 013, no albumin or sugar and few Wbc., creatinin 1 1, Urea N 8.2 sugar seventy-eight Rbc 3,500,000, Hgb sixty per cent, Wbc 9,200, Polys seventy-four, lymphs twenty-two, trans, four, B P 165/115, sedimentation time, seven mm in thirty minutes

Fundus was converted into multinodular mass extending to level of umbilicus On Aug 4 at laparotomy, a routine supracervical hysterectomy was done Two days later patient began to cough Temperature 101 pulse 124, subcrepitant rales, increased fremitus, and whispered voice sounds over L L. lung posteriorly There was moderate abdominal distension and while temperature and pulse remained high, the chest condition under croup tent cleared On Aug 9 the skin clips were removed The wound apparently healed and clean Following supper the same day, patient began to belch with sour eructation and vomiting of ingested food She was cold, bathed in perspiration, and an inspection of wound showed complete separation of incision with evisceration In the operating room the intestines were replaced and wound resutured Patient grew progressively worse, with increasing abdominal distension and rapid pulse and died on the eleventh postoperative day of a generalizing peritonitis No autopsy

CASE 6 A thirty-eight year old colored woman was admitted September 4, 1936, complaining of a feeling of heaviness in the lower abdomen Nine years before patient first noted a movable mass in the abdomen This mass has been getting progressively larger and is not painful or tender Menses regular duration—four to six days

Examination Heart and lungs essentially negative Blood pressure 120/85 Urine negative Creatinin 1 2, Urea N 8 7, sugar ninety-three, Rbc 3,100,000, Hgb sixty per cent, Wbc 6,550, Polys seventy-four, trans six, lymphs seventeen, eosin two, and baso one, Kahn 4+

The abdomen was filled by a large, firm mass extending above the umbilicus to within two fingers of the costal border

This mass sprang from and included the fundus and adnexa, the latter apparently negative On September 19 at laparotomy, giant fibroid uterus, twenty cm or more in diameter, with pedunculated, intramural, and submucous types of growths was removed by supracervical hysterectomy The postoperative course was uneventful until the ninth day when patient began to complain of palpitation and dyspnea The pulse became thready Medical consultation gave opinion that there was pulmonary infarction Patient died within forty-eight hours, probably from multiple emboli with one large occlusion No autopsy

CASE 7 A twenty year old colored female was suddenly seized four days before admission with severe pain in lower abdomen, both sides Her menstrual periods usually last from nine to ten days, accompanied with cramplike pains occur every three weeks, and always irregular Last period began October 22, 1936 She was flowing on admission She was never pregnant On physical examination, patient had a soft blowing systolic murmur over the precordium transmitted to apex and base B P 110/75 Urine negative Rbc 3,950,000, Hgb sixty-five per cent Wbc 10,500, polys seventy-eight and lymphs twenty-two Sedimentation time twelve mm in sixty minutes Vaginal examination showed some tenderness in both lateral fornices with thickening of right tube The uterus was in retroposition At laparotomy November 14, an acutely inflamed left tube, a

closed thickened right tube, and a small ovarian cyst were removed. After closure of the peritoneum the pulse was 108 and of good quality On closing the skin the anesthetist reported that the patient had stopped breathing Despite attempts at resuscitation, stimulation, and artificial respiration, patient expired on table No autopsy

CASE 8 A twenty-two year old colored female, II-gravida, II-para, was admitted December 2, 1936, complaining of pain in R L Q She had experienced this pain off and on for the past five years It had grown worse in the past three weeks Last menstrual period one month prior to admission, and had continued the entire time until admission Her usual periods were four days in duration

Physical examination Heart and lungs essentially negative B P 110/70 Urine negative Rbc 3,600,000, Hgb seventy-five per cent, Wbc 17,500, Polys seventy-six and lymphs twenty-three Sedimentation time was eighteen mm in thirty minutes

The fundus was posterior and pushed over to patients left by a large, globular tender mass filling the right fornix The diagnosis of acute pelvic inflammatory disease with right tubo-ovarian abscess was changed to ectopic pregnancy and tubal abortion, on account of sudden enlargement of the mass in the right fornix with acute pelvic symptoms and fairly slow sedimentation time Laparotomy on Dec 8 disclosed a right tubo-ovarian mass and left pyosalpinx with extensive adhesions of intestines The abscess was ruptured during removal The abdomen was closed without drainage The postoperative course was stormy from the beginning, death coming on the fourth day from generalizing peritonitis No autopsy

Of the seventeen wound infections, fifteen may be classified as mild infections They were all completely healed and patients discharged from the hospital by the sixteenth postoperative day, thirteen of these were healed and discharged by the fourteenth day These infections ranged from simple serous exudate from lower angle of wound or stitch abscess to those cases where a small amount of pus was evacuated usually after applying moist dressings to an induration along the entire suture line

It is our feeling that there are two important contributing factors in this group, (1) Failure to ligate small bleeding vessels in the subcutaneous tissue followed by formation of small hematomata and (2) leaving excessive catgut knots in the subcutaneous tissue especially at the lower angle of the wound

In two cases the infections were severe. A few of the lower clips in the incision were removed and the wounds dakinized These areas completely healed by granulation on the twenty-second and twenty-fourth postoperative days We regard any moisture exuding from the wound as an infection in clean cases, where pus is spilled during operation or where drainage has been instituted the case is not considered a clean one

Major complications were eighteen, including three resulting in postoperative deaths There were seven pulmonary complications—three pulmonary embolus, one atelectasis, one pneumonia, and two bronchitis There were two generalizing peritonitis, one acute dilatation of stomach, one laceration of bladder, one thrombophlebitis, one cervicosigmoid fistula, three partial intestinal obstructions, one complete intestinal obstruction, one paralytic ileus

It is to be remembered that this service is in a busy city hospital where there can be no selection of cases The worst possible types of cases usually declined at other institutions regularly present themselves for admission

Long periods of bed rest and supportive treatment with free use of transfusions, tonics, etc, is the rule Every attempt is made to put these patients, their defensive mechanism, physical and mental already at lowest ebb, into the best possible condition to withstand major surgery

With the abundant material at our disposal we recognize our duty to train younger men in the proper management of gynecologic cases Consequently our organization provides for intimate and personal responsibility on each member of the junior attending staff for a limited number of cases These patients are thus individualized and despite the fact that the major part of the surgery is done by junior attendings and members of the house staff under proper supervision we believe our results compare very favorably with other large clinics where the material is more highly selective and where the type of pathology with which we deal daily is an infrequent occurrence rather than the rule

EMBOLISM FOLLOWING HEMORRHOIDAL INJECTION

FRANK A MARSHALL, M D, *New York City*

In a search for the complications following the injection treatment of internal hemorrhoids, which has become quite popular within the past few years, it is surprising to note the paucity of case reports or even opinions on embolism following injection

Extremely optimistic has been Junghaus [1]

Actually serious complications have not occurred during injection treatment of hemorrhoids according to the reports in the literature Bensaude in 10,000 such injections has never observed any serious accompanying manifestations or sequelae *Emboles have never been observed* (Bensaude, Glaser, Meisen and others) Elener observed in one case a thrombosis of a vein of the leg

The rich vascular network surrounding the rectum would seem to indicate a greater frequency of embolism The two chief plexuses of veins surrounding the rectum are the internal hemorrhoidal plexus in the submucous coat of the rectum and the external hemorrhoidal and superior hemorrhoidal veins respectively Thus connections are present between both the portal and systemic vessels creating possibilities of emboli to both the liver and lungs

Newman[2] mentioned one case of embolism following the injection of quinine and urea HCL

The following case resulted from the use of five per cent phenol in vegetable oil

Case Report

W D, male, age twenty-eight, married, following injection of five c c phenol in oil into the anterior left quadrant of the rectum on August 3 1936 developed a sudden chill and fever three hours later In addition there was a slight cough and pains in the right upper quadrant of the abdomen He also felt slightly nauseated

Patient called me to his home two days later at which time he complained of pain in the epigastrium and in both eyes and legs

On physical examination there was tenderness in the epigastrium and right hypochondrium Temperature at the time was 98 4° Patient still complained of occasional coughing spells

On August 9, about a week after the injection, patient was completely recovered.

Previously, patient had been given six quinine and urea HCL injections into the hemorrhoids proper The last injection was the third phenol in oil injection he had received None of the previous treatments affected him in any way

It is probable that this patient experienced emboli in the liver and possibly the lungs as evidenced by pain and tenderness of the right hypochondrium and epigastrium and by his slight cough

BONE CONDUCTION HEARING AS GOOD AS NORMAL

Hearing by means of bone conduction, resorted to by those suffering from a certain sort of impaired hearing, can reach as high a degree of perfection as normal hearing Dr N A. Watson of the University of California at Los Angeles reports (*Journal Acoustical Society of America* October 1937)

Many handy suggestions for deaf people using this means of keeping in touch with the audible world were contained in Dr Watson's report.

Bone conduction using the bones of the head to conduct sound instead of the air inside the ear as normally occurs, works best if the mouth is closed and the teeth are together, but not clenched, he finds He found that conduction through the bones of one ear gave as good results as simultaneous use of both ears

Dr Watson who used a special sound chamber and test rooms for conducting his experiments, was his own "guinea pig" He conducted the experiments on himself, checking comparative ability to distinguish conversational sounds by ordinary hearing and bone conduction—*Science News Letter*

Preventive Medicine

Umbilical Cord Wassermann and Kahn Tests

The incidence of congenital syphilis seems to be on the decline, but there are still some cases In our experience, it is extremely important that treatment should be begun at the earliest possible moment, for we find that, as in acquired syphilis, any delay in starting treatment makes the case much more difficult to cure Therefore, any help at arriving at a diagnosis should be welcomed

There are many localities or situations where the Darkfield examination of skin lesions on the baby or the umbilical cord, the microscopical examination of the placenta, or the x-ray examination of the long bones are impracticable or impossible, and yet where a test of the umbilical cord blood may be very easily done

There is still some confusion as to the significance of this cord test We have reported on our experience with it, and some further experiences with the Wassermann and Kahn tests are here given in the hope that if our experience is duplicated in other laboratories it may be a help in arriving at an early diagnosis

The Rochester Health Bureau Laboratories report three tests on any blood submitted for a diagnosis of syphilis—each in six different intensities—negative (—), doubtful (±), 1+, 2+, 3+, 4+ Two of these tests are Wassermann tests—the noncholesterinized (Bordet) and the cholesterinized—the third is the Kahn test They are reported in this order In this region, where there is no yaws or leprosy, a strongly positive test like a 4 4 4 is assumed to mean syphilis Very rarely bloods have been reported as 4 4 4 that subsequently show frank negative tests Some of these we have ascribed to errors, either in the collection and labeling of the specimens or at the laboratory Some are unexplained It is pretty generally agreed that an acquired secondary syphilis will always give a 4 4 4

Our thesis is that a baby born with congenital syphilis is in practically the secondary stage of the disease (for it cannot be over nine months) and that, therefore, the cord blood should show a 4 4 4 in a case of congenital syphilis

In October 1933, we published a paper in the *American Journal of Syphilis* indicating that the "reagin" (or the substance in the blood giving the positive Wassermann reaction) in a pregnant woman passes through the placental circulation, and appears in the cord blood showing the same intensity of reaction as the mother's blood does at the time of labor, that is, a 4 4 in the mother shows as a 4 4 in the cord blood, a —3, in the mother as a —3, in the cord, and a frank negative in the mother as a frank negative in the cord There is apt to be a slight hemolysis in the cord blood so that one frequently sees a slightly less intense Bordet in the cord blood than in the mother's—the mother's being a 3 4 and the cord a 2 4

A corollary to our thesis is that the "reagin" giving the positive Kahn test does not as a rule pass through the placental circulation, and that if the mother shows a 4 4 4 at delivery, the cord blood may also show a 4 4 4 meaning syphilis in the baby, and that the fetus has developed the substance giving the 4+ Kahn, or that the cord blood may show a 4 4 — indicating the absence of syphilis in the baby There have been some instances in which the Kahn, although perhaps not a frank negative, will be only a +

We believe that although this observation is not as absolute as our experience would indicate in the case of the Wassermann test duplicating the mother's test, it is significant enough to be of some practical use. In other words there are some cases in which the Kahn "reagin" does pass through, and yet the baby does not have syphilis, and rarely there are some cases in which the Kahn is negative in the cord and yet the baby may have syphilis

I—Examples of peculiar reactions coming through
(Bordet is usually weaker than the cholesterinized)

Probable explanation of IV Fetus on the way to cure by prenatal treatment of mother, Kahn coming down first, but as the treatment stopped at birth, the disease recurred in the baby to be cured later by treatment

Probable explanation of cases like V-2 That the fetus is actually cured but it takes some time for the test to come to a negative We have seen this in acquired syphilis where a 4 4 4 dropped in five months to a negative with no treatment in the meantime.

To RECAPITULATE—A positive Wassermann of the Cord Blood indicates syphilis in the mother The baby may or may not have it A strongly positive Kahn test in the Cord Blood indicates, but is not pathognomonic of, congenital syphilis in the baby A positive Wassermann but negative Kahn in the Cord Blood indicates the baby is alright in most cases but it should be followed.

DR JOSEPH ROBY,
Deputy Health Officer

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

A Few Words on Feeblemindedness and Signs of Feeblemindedness

Although mental hygiene or preventive mental medicine deals both with light psychosis and with feeblemindedness, we should not confound one with the other

Mental disease does not exclude intelligence The brighter the patient the more material he has at his disposal for his disturbance.

But feeblemindedness signifies lack of intelligence to a higher or lower degree in the same sense that cold is only a smaller amount of heat It is not a disease, but an insufficient development of the mind, which remains lower than the average It is not curable In many cases, under favorable circumstances, an improvement is possible

Intelligence is the capacity to understand and to relate facts and ideas We can have more or less of it Human minds differ in many ways—just as physical qualities differ We can be tall or short, pale or red, weak or strong We show various degrees of muscular strength So our minds may be weaker or stronger, slower or more alert. Some are exquisitely fine and quick, others are dull, and still others are average or between the extremes Low mentality in children or adults, whether we call it *dullness, borderline, moronism, imbecility, or idiocy* or various stages between, is usually congenital, though sometimes it may be acquired through somatic illness, acute or chronic It is probably often due to a real pathological, organic change

In the less pronounced cases it is amenable to treatment, training, and teaching or to an adjustment to well-chosen surroundings and to special work, but almost never to a real cure—that is, to normal or adequate intelligence When not extremely advanced, it may not interfere with ordinary living or with social life, and, if simple and uncomplicated, not even with usefulness

Contrary to the prevailing belief, I am convinced that most people are fairly intelligent, that is mentally fit and not inferior to their expected "mental age," whether educated or not, especially if they are judged from the point of view of their occupation and their station in life One, somewhat superficial, although extensive, investigation found the mentality of the average American young man above twenty-one equal to that of a twelve-year old Another more scientific, inquiry raised the intelligence level of the adult to that of a fourteen year old youngster and discovered at the same time that there is *no important difference between the sexes* in this regard and that intelligence as such fails to develop or to decrease *after twenty* But the defect of this latter work was that it was done on a comparatively very small scale The results of such "studies" lead to much misinterpretation The tests that have been used should be regarded as resting on a false basis and the so-called twelve-year mental age as the normal or average adult mental age

Education and training should not be mixed up with intelligence Nor should they, by the way, be mistaken for character, as it is sometimes erroneously done An illiterate, unpolished peasant may be highly intelligent, gifted and have an independent, strong character, while a savant may be dull and, or, simultaneously characterless, selling his knowledge to the first-comer for mercenary ends

Also, there are people who are great in some fields of activity and stupid in others, as we see in some exceptional and famous persons *Gifted, talented exceptional children,* because of their difficulty to adjust themselves to surroundings and because parents and teachers do not recognize them, may be mistaken for inferior intelligences

Heredity in the Mendelian sense is considered as an etiologic factor in mental deficiency But many cases are also due to poverty, congestion in living quarters, too many children in the families It may be a further increase from a latent and pre-existing dull and borderline, socially scattered, condition But stupidity in human beings is constantly being implanted by all forms of bigotry, misinformation, wrong upbringing, and wrong education Therefore, feeblemindedness would tend to decrease and perhaps to disappear in a society where men would be more masters of themselves and would learn to think as independently as possible We may say that while we cannot control past heredity, we may under ideal conditions, control future heredity

The most evident subnormalities can be easily detected even by the merest tyro

The others are known through "psychometric" examinations or special mental tests or, in the hands of the competent, through an estimation which may amount to exact knowledge.

With the exception of the very evident cases it is difficult and sometimes impossible to recognize real feeblemindedness in the *first two years* of the child's life But the interest of the children in their immediate environment, the smile, the cry, the reaction to stimuli, provided they *see and hear* well, should be of some help in differentiating the normal from the abnormal

In later childhood years some of the plainest methods, such as the following, to be of use to the *general practitioner* and even to the *parents,* should be sufficient to attract attention to mental deficiency

At the age of three Should be able to show mother, father, mouth, hands, feet, to give names of familiar people, to imitate body motions, to repeat a simple sentence. Talking and walking difficulties should have been overcome

At *four* Designate familiar objects and name them, knowledge of boy, girl, imitation of various more complicated motions, reciting a very brief story after it is told, right and left, building with objects or blocks a tower, a wall, stairs, name furniture shown, differences in size, big, little, bigger, smaller, higher, taller, some striking colors, explain some plain pictures, put things where they belong, counting

At *five* Imitation of drawings, drawing from memory, names of well-known animals, answers to questions with "why" and "what for" within the child's range, counting, children's games, counting of several identical or similar objects, dressing, undressing, recognizing more colors

At *six* More intricate building with blocks and more difficult drawing, tying, untying, more refined dressing, working with scissors, the use of a key, modeling, differences of lengths, widths, opinions about acquainted people, repeat or make up a longer story, tell what food on previous day, what significant event on previous day or in the recent past, something about friends and playmates, counting backwards, about things seen, grass, tree, boat, river, mountain, sea

Retardation is not the same as feeblemindedness

Retarded children are slower or temporarily slower in their progress They may be more advanced in some respects and more behind in other respects Their intelligence is improving steadily, but at a less lively pace than in the ordinary child In their case prognosis should be guarded They should be watched

Institutions are unavoidable for the worst forms of mental subnormality But institutionalism is at best a necessary evil Whenever the weak-minded children can be kept at *home* or in somebody's home, they are better off

The higher grade of hypophrenic as well as the delayed children will benefit from the contact with other children and adults and will learn much from the scheme of things to be seen and witnessed around them

The principles of upbringing, education and pedagogy are the same in the normal and the abnormal, as all minds are based on the same psychological foundations But the methods must be different or must be applied in a different way

The system of the so-called "ungraded classes," as it exists in New York City, in spite of the sincere and well-meant efforts of their often splendid special teachers, is nothing more than an inefficient makeshift and a promiscuous dumping ground. Its unfitness to solve the difficult problem of teaching the feebleminded is greater than the unfitness of its little patrons themselves Retarded children should never belong there. They would be worse off in those classes than the incurable defectives

PREPARING BRITISH DOCTORS FOR WAR

Britain's preparation for war includes a canvass of all physicians to find and list those available in case of emergency As we are told in the London letter of the *A M A Journal* a classification into the following categories is proposed 1 Those willing to accept whole time service at home or abroad 2 Those willing to accept part time service at home 3 Those willing to offer emergency service for the medical care of civilian casualties after air raids or bombardments (*a*) in any part of the country to meet a local emergency or (*b*) in their own areas The inquiry will be conducted with regard to all physicians whether members of the British Medical Association or not.

Federal Health Management

Although faced with a legislative deadlock growing out of the Anti-Lynching Act, the Administration has on several occasions reiterated its determination to press for reorganization of the executive branch Two bills are, in fact, prominent on the Senate agendum, one having already passed the House of Representatives

If reorganization of the Federal government is really to be effected this year, the time is ripe for enactment of a reform which organized medicine has urged for over sixty years, namely, the establishment of a national Department of Health As Federal functions have expanded, the Cabinet has been correspondingly enlarged to give agriculture, commerce, and labor a voice in important executive, deliberations The nation's health is deserving of equal consideration, particularly since Federal health activities are continually on the increase

Influenced, perhaps, by the social service group which looms large in the present Administration, Mr Roosevelt has declared himself in favor of placing public health under the control of a general Welfare Department This is incompatible with maximum efficiency in planning and accomplishing public health programs

A lay Secretary, however well informed on sociological questions, is unqualified to pass judgment on public health projects or the abilities and capacities of public health officers If medical plans require the mediation of a lay department head to reach Congress and the President, they will be subject to misunderstandings and mistakes, which must inevitably delay the organization of national health work and impair its effectiveness

At present Federal health functions are scattered in a number of agencies without uniform supervision or control Concentration of these various enterprises in a single department would undoubtedly promote greater efficiency and produce better results—provided the department were a medical one

To subordinate public health work to a general welfare program is to repudiate fundamental tenets and ignore the technical demands of this field With their special knowledge of what is involved, the physicians of the country urge the creation of an independent Federal Department of Health to plan and direct national health work

The New Lien Bill

Framed with the aid of the New York Bar Association, the physicians' lien bill sponsored by Assemblyman Fite answers the legal objections raised to previous legislation of this nature With techni-

calities out of the way, there can be no serious opposition to a law which grants medical men a measure of protection such as hospitals and lawyers already enjoy

The new bill is simple and easily understood It provides that a physician rendering service for personal injuries may impress a lien for the amount of his fee against subsequent damages granted the injured person

This is elementary justice When a physician is summoned to attend the victim of an accident, he does not stop to inquire whether he will be paid for his services He takes care of the patient first and worries about his bill later

All too often it happens that he has cause for worry The injured person sues, including medical costs among the losses he has sustained When an award is granted, however, he frequently forgets the item of medical expense and pockets the doctor's share of the grant

The hospital has a lien on the award to protect its bill The lawyer deducts his fee before paying over the monies recovered Only the physician is left out in the cold

The Fite bill does not confer any special or undeserved privileges on the medical profession It merely aids the physician to collect a just bill at a time when the patient receives money for the express purpose of paying it

If the profession makes itself heard, the Fite bill should be enacted this year It is just and practicable With legal technicalities disposed of, there can be no conscientious objection to it Every medical man should get behind this measure and let his representatives in Albany know he is wholeheartedly for it

---

Medical Leadership

There has come to us an address delivered by our President in Rochester, on Leadership It was published in our last issue Dr Goodrich stresses the need for expert leadership in welfare and health for our people The combination which medical men possess—knowledge of human ills, ability to comprehend the relationship of cause and effect and an experience which teaches them to discard what trial proves to be fallacious, makes of a thinking doctor an ideal community leader—requires no reiteration here

In the choice of leaders the profession often faces similar difficulties as are inherent in our democracy The clever politician, the man who has the knack of staying on both sides of a given question until the trend in public opinion is clear and then joins with the winning side, is as known to our circles as he is to the observer in the larger field of general politics Organized medicine is but a segment cut from the whole body-politic and contains the same elements

Medical leadership at its best, is seen where given situations are studied against the background of the trends in current affairs, and a course determined upon, after knowing what the best is that organized medicine can deliver With us there is neither a right nor a left wing Every element in our ranks has but one objective, and the goal towards which all are striving is the same—the improvement of the health of the whole community, and bringing the details which are employable to combat disease and lessen its incidence among the people The problems we face embrace economics, engineering, slum-clearance, crime prevention, safeguards to lessen health hazards in mine, factory, store, school and home Into our field there come problems of transportation, not only of people, but of food-stuffs, and sanitary conditions of marketing and food preparation These all present problems concerned with medicine Medical leadership must evolve from among those of us who have vision broad enough to encompass this large horizon

Doctors are traditionally trained to stand alone and thus face and take responsibility In assuming medical leadership, this training is vastly important For the majority of those on whom the responsibility of leadership rests must have

both the intellectual honesty and the courage to face reality, study causative factors, and determine a course of action to be taken

Gentle Reminder

Before the entrance of our nation into the Great War, and before the rapid increase in the number of specialists in our profession, an outstanding pediatrician presented to his class a small male child who had a swollen knee joint, bleeding gums, and hematuria He asked the group of fourth year students to attempt a diagnosis They all demanded blood studies, x-ray examination of the kidney and joints, functional tests of the kidneys and even cystoscopic investigation! All this to make the evident diagnosis of scurvy In his kindly manner he then reproached the class as follows "Gentlemen, please don't become pseudoscientists"

In the mad rush of the years that followed, the keen clinician, whose influence is still stamped deeply in the mind of the practitioner of forty and over, has been relegated to the background of the teaching side of medicine Anyone who has examined applicants for the position of intern, cannot help but be impressed with the disparity between the amount of laboratory data and the paucity of pure clinical knowledge which is evident in the written papers It must not be implied that the value of scientific training is questioned but it is meant to be understood that the bedside training in everyday clinical medicine has been neglected

The above has been inspired by the perusal of a seemingly unimportant contribution by Dr Howard Lilienthal which appeared in a recent publication of the *A.M.A. Journal*[1] One of the physicians responsible for the outstanding progress of the development of surgery in this country writes for us a concise clinical note on "Pruritis Ani, A Simple and Efficient Treatment" The therapy he advises is of less importance than the hidden warning contained in his trite communication It almost seems, after repeated readings, that he had intended his article to be entitled "Pruritis Medicinae." Therefore, with all italics, omissions and additions ours, we quote "The therapy of pruritis ani seems to have come into prominence during the past year More and more the operative treatment has monopolized the literature While I do not doubt that in some instances the formidable procedures which have been described may be advisable, yet the cases most frequent in general practice may easily be relieved or even cured by simpler means" He claims no priority for his simple remedy, but he states that it has been so successful that *"it is my duty to describe it here"*

Fortunately there are still among us many doctors of the "hard-headed" school of medicine, and we ask that they please leave as their legacy such pertinent information as Dr Lilienthal has recently contributed in the *J.A.M.A.*

1 Lilienthal H *J.A.M.A.* 110 509, 1938

Surgery of Essential Hypertension

Experimental investigation to date has failed to reveal the exact cause of essential hypertension There is no conclusive evidence at hand to demonstrate that the organs of internal secretion or the central nervous system are the sole factors resposible for the appearance of an otherwise unexplainable rise in blood pressure It is true that the splanchnic vessels to a large extent control the variations in arterial tension but it seems that the peripheral blood vessels are themselves supplied with a nerve mechanism capable of governing the level of the arterial pressure

In estimating the value of the several surgical procedures advocated for the relief of essential hypertension, Heuer[1] feels that in the main all are effective only to a limited degree Severance of the anterior spinal roots, removal of the celiac

1 Heuer G J *Bull N Y Acad Med* 13 692 1937

ganglion or a splanchnicotomy merely serve for the interruption of those sympathetic fibers which control the pressure in a particular part of the blood stream Nevertheless, certain definite results from surgery are apparent and warrant a continuation of the investigation along clinical lines

In almost every instance, Heuer has found that all the subjective symptoms, and headache in particular, were definitely improved following section of the anterior roots Retinal hemorrhages and papilledema likewise disappeared even though the blood pressure showed no more than a slight reduction following surgery Most encouraging of all was the ability to rehabilitate patients who were completely incapacitated and to return them to their normal fields of activity From the patient's standpoint, the relief obtained in itself would justify the operative measures despite the failure in many instances, to obtain a substantial reduction in the pressure Exactly what type of surgery will finally prove most effective remains to be decided The physician who has treated a case of essential hypertension and has failed to obtain an improvement in the symptomatology should consider surgical therapy as a means which at present affords the hope of a symptomatic cure

CURRENT COMMENT

"THE PHYSICIAN IS AS NECESSARY to the public health as is the health officer or the sanitary engineer The work of the private nurse or the visiting nurse is as necessary as that of the public health nurse The hospital and its out-patient department are as necessary as the health department "—The words of the late Edgar Sydenstricker

"'IN WELFARE PROGRAMS the State and nation are taking steps that will affect not only the pocketbooks but the lives and philosophies of our grandchildren Will those effects be desirable ones? my remarks are chiefly addressed to those of you who will test and be tested by, the present eagerness for State-provided security

"'Every civilized man has sought a stable future for himself and his family As industrial civilization developed, power, through property, centralized in a few hands, those few who had enough property could face the future with relative confidence, but the many who had little were less complacent'" Dr Alan Valentine, president of the University of Rochester, addressed the student body on February 10, and drove home many points regarding "security" We quote further from *The New York Times* report of his talk.

"Dr Valentine continued that 1914 and 1929 brought 'two different kinds of chaos and showed us how uncertain in spite of all efforts, were both our lives and our daily bread A man's ability to protect his future vanished in the smoke of artillery and the flutter of pieces of paper ironically called securities

"'We only know that we wanted more security and that only the State could provide it, since only the state can successfully spend money that it does not have,' he said

"'It is one thing for individuals, or private groups of individuals, to provide for their own future, it is quite another to demand that the State provide individuals with financial guarantees Therein lies the difference between the old way and the new When government offers to us, as individuals, financial security, and we, as individuals, accept it, we have worked a fundamental change in the American concept of government, and also in the American concept of individual independence

"'The new concept changes not only our traditional political thinking but also our traditional idea of the importance and responsibility of the individual

"'We have been brought up to think of the American as a man who stood upon his own feet and blamed only himself for failure

"'Americans of that tradition had their faults, but timidity was not one of them—as pioneers they took chances and usually gained their objectives'"

WE CALL ATTENTION TO the fact that "The so-called national health inventory financed by a $4,000,000 grant from the WPA has been brought nearly to completion It comprises investigation of health conditions and their relation to economic status among 3 000 000 individuals in ninety cities Results of this survey the most extensive of its kind ever made are about ready for distribution"—*Medical Economics* for February

"THE MOST FORMIDABLE WEAPON that we possess against state medicine, irregular

practice, cults and other elements that threaten organized medicine is the conscientious practice of our profession No amount of protective legislation that we may pass can equal the painstaking performance of our daily tasks"—If this is not the *most* formidable weapon at our command, we agree with the *Bulletin* of the Academy of Medicine of Toledo and Lucas County (Illinois) in that it is at least a very valuable one indeed

"H G Wells some years ago made the statement, 'We must have education, or we will have catastrophe' Contrary to the opinion of many who read this statement, Wells referred to the education of adults, and not of the younger generations in our public schools

"In our educational considerations, the campaign for the education of adults as well as the youth of America in health matters, is of utmost importance Medical societies and medically trained individuals must be leaders in all health considerations, and a complete uniformity of ideas and ideals is essential if we hope to be successful in our endeavors"—Dr Harold M Camp, Secretary of the Illinois State Medical Society, in an article on "The Correlation of Secretarial Duties in the State Medical Society" to be found in the *Illinois Medical Journal* of February

In the same journal, Dr J R Neal writes of "Medicine in an Evolving Society," and he states that, " Medicine has not been overlooked by those who would create a new society in a new world The practice of medicine is rightly considered as a fundamental factor in social life Many of the plans put forward with respect to change however, appear to assume that the medical profession is not aware of this fact They presume that the practice of medicine has been and continues to be static The proponents of these plans either refuse to see or are blind to the ever changing progress and adjustments made by medicine to meet new situations They offer the idea of compulsory health insurance as a panacea of medical care

"Social conditions are unsettled Reform is the order of the day Medical practice is a matter of deep public concern *Guiding the trend of changes which are bound to come will require sound thinking and a clear vision* " (Italics ours)

"The science of Semantics deals with certain Mental Monsters that are found abundantly in all media of communication A more academic definition would state that Semantics is the science of communication, embracing matters having to do with significance or meaning To put it still another way, Semantics embraces the study of words, appreciation of what words refer to, and the awareness or disregard of words or phrases that suggest different things to different people, or that mean absolutely nothing to anybody The great injunction from Semantics is to find the referent—or, as the old duchess said with a toss of her head when first she heard the word, technocracy—'and what, precisely, do you mean by that'

"If Rugged Individualism were allowed to flourish in a More Abundant Life that were tempered by Human Values and respect for Social Justice, the Human Budget would soon be balanced for The Law of Supply and Demand would stymie The Law of Diminishing Returns Value would unite with Wealth to inflate Capital, Agriculture would combine with Labor to feed Destitution, the Consumer would take a walk with the Producer, Truth would play pinochle with Justice, and Individualism would sit on the sidelines to view this beautiful spectacle when Government would come around with ice-cream and would get sick and yell for National Health and Adequate Medical Care

"From other sources we learn that the League of Nations is considering the establishment of a Department of Verbal Peace in an effort to discourage peoples of the world from developing and brandishing Terms and slaying one another with words" —A wise bit of nonsense from the February *Westchester Medical Bulletin*

At the February meeting of the New York Polyclinic Clinical Society, the following program was presented

"Spinal Anesthesia" by Thomas F McLaughlin, M D

"Modern Concepts on Addisonian or Macrocytic Anemia" by Lea A Riely, M D of Oklahoma State Univ Discussion was opened by James P Croce, M D

"Clinical Review of Results of 241 Operations for Essential Hypertension" by George W Crile, M D, Cleveland Clinic, Cleveland, O Discussion was opened by S Philip Goodhart, M D

COMMITTEE ON LEGISLATION

Bulletin No 5

New Bills Introduced

February 4, 1938

Senate Int. 591—Schwartzwald, Assembly Int 797—Gugino, extends to April 1, 1938, time for report of commission for study of treatment of cancer cases Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Senate Int. 637—Dunkel, prohibits sale of poisonous, deleterious or habit-forming proprietary medicines by manufacturer or wholesaler to other than those registered by education board, with certain exceptions Referred to the Education Committee

Comment This bill has been before the Legislature several times Last year's bill was amended twice and this bill is identical with the last print of last year The chairmen at the conference in 1937 approved it. The bill passed the Senate last year but was defeated in committee in the Assembly

Senate Int 644—McNaboe, provides for commitment to care and custody of lunacy board of persons in confinement for felony or for certain misdemeanors where there is reason to believe such person is insane or mentally defective Referred to the Codes Committee.

Comment This bill has not yet been printed Comment will be made in the next bulletin

Senate Int 647—McNaboe, requires each pupil upon entrance in public schools, and semi-annually thereafter, to be examined by a licensed psychiatrist, and permits proceedings to commit mental defectives to state institutions Referred to the Education Committee

Comment The basis on which a child shall be excluded from school and committed to an institution reads "If it be ascertained upon such examination that any of such pupils are afflicted with a mental disability of such a type as will interfere materially with the instruction of other pupils, the principal or teacher in charge of the school where such pupil is in attendance shall take proceedings to have such pupil committed to a state institution in accordance with the provisions of the Mental Hygiene Law"

Senate Int 651—McNaboe, creates state lunacy authority in executive department and provides for local lunacy boards in each judicial department prescribes salaries and fixes powers and duties Referred to the Judiciary Committee

Comment Creates a state lunacy authority of five members, one of whom shall be a physician with five years' experience in actual practice and a qualified psychiatrist as provided by the law which was enacted in 1936, another shall be an attorney with five years' experience in actual practice, the third a citizen of the State who shall have been a resident of this State for at least five years, the fourth the Commissioner of Mental Hygiene or his deputy, the fifth a member of the local lunacy board from the same zone as the person examined. Zones are coterminus with the judicial departments of the State Members shall serve for two years, appointed by the Governor with the consent of the Senate, at a salary of $7500 00 Powers of the authority are (1) To review the findings of the local board where there has been a dissenting opinion, (2) In all cases where it has been determined by the local board that the person is insane, (3) To examine any person upon his release from a State institution where he has been confined as insane or mentally defective

It also provides for the creation of local lunacy boards, one in each judicial district, to consist of three members, each of whom shall be a citizen and resident of the said judicial department for which he is appointed by the appellate division One member shall be a psychiatrist licensed to practice in this State "and recommended by the Academy of Medicine", one member shall be an attorney practicing in the same judicial department, another a citizen, a resident of the department. The psychiatrist and attorney to serve for two years and the citizen for one year the psychiatrist and attorney to receive $5000 and the citizen $3000 per year

Powers (1) To make a history of the social background of all persons sent to be examined by any judge, justice or magistrate, (2) To make a psychiatric, psychological and psychometrical examination of all such persons, (3) To report their findings to the court in which such person was originally arraigned, (4) To report their findings to such court with one copy to the lunacy authority, of all examinations of persons found to be insane or where the board has a divided opinion

Persons to be examined are all who shall be held in confinement for a felony or for any of the following misdemeanors Illegally using carrying or possessing a pistol or other dangerous weapon, making or possessing burglars' instruments buying or receiving stolen property, unlawful entry

of a building, aiding escape from prison, unlawfully possessing or distributing habit-forming narcotic drugs

The two bills that we reported last week without comment because they were not printed, follow

Assembly Int 705—Flynn, to amend the Civil Practice Act in relation to the inspection of hospital records The amendment reads as follows "Inspection of hospital records by attorney Upon the presentation to the superintendent or person in charge of a hospital, of a written authorization, duly executed and acknowledged by a person who is or has been a patient in such hospital, authorizing the inspection of the records of such hospital by his or her attorney, such attorney shall be given access to and allowed to inspect all the records of such hospital relative to the care and treatment of such person while a patient therein"

Assembly Int. 711—Sullivan, to amend the Education Law in relation to the practice of ophthalmic dispensing Defines ophthalmic dispensing as "A person practices ophthalmic dispensing within the meaning of this article who engages, or who holds himself out as being able so to do, in the filling or dispensing to the ultimate consumer, of ocular prescriptions involving lenses, spectacles, eyeglasses, optical devices or any ophthalmic appliances except drugs and medicines, as prescribed by physicians and by optometrists, and intended to be used for eyewear or for the aid, correction, relief or treatment of visual or ocular anomalies, and in the surveying and measuring of the external features of the face and head of said consumer for the proper designing and fitting as required by such prescriptions, and in the fitting, servicing and adjusting to the ultimate consumer, with respect to such prescriptions, of any of the aforementioned materials or combinations thereof, and in the dispensing, furnishing, selling or supplying to the ultimate consumer, of any of the said commodities or essential parts or accessories thereof"

Provides for the creation of a licensing board in the Department of Education and the qualifications under which persons can secure licenses No person may practice without license after January 1, 1939, must be a graduate of a four-year course of study in a secondary school, and either actually engaged in ophthalmic dispensing for not less than five years or has completed a two-year course of study in a school of ophthalmic dispensing, and in addition thereto, has had practical training in ophthalmic dispensing for not less than three years

Assembly Int. 858—Fite, gives *physicians* right of *lien* for aid, treatment, care or services on account of personal injuries resulting from negligence of another, except where settlement or verdict is less than $300 00 Referred to the Judiciary Committee

Comment Fundamentally, this is the bill that Mr Fite carried for us last year, which reached third reading in the Assembly In the discussion of the bill at that time certain amendments were suggested, and during the Summer a committee of the New York County Society, the New York Bar Association, with Dr Lawrence, carefully studied the bill and incorporated the suggestions that were made in the Legislature. The bill provides that in all cases of personal injury where a physician or surgeon is called to render service, and the injured person is eventually to receive an award or settlement, the physician or surgeon may impress a lien against such award or settlement for the amount of his fee. It is important that you should know exactly what this bill provides in order that you may most forcibly discuss it with your legislators May we suggest, therefore, that *we shall be glad to supply you with a printed copy upon request*

Assembly Int 884—Dailey, prohibits person with communicable disease to work as domestic when allowed to take care of children or to handle food, requires that domestics be examined for presence or absence of any such disease, and permits isolation and treatment, if necessary Referred to the Health Committee

Comment Prohibits person with communicable disease from accepting position as a domestic which involves the care of children or the handling of food All persons so employed now must within sixty days submit to a physical examination, and persons applying for work shall be physically examined within thirty days of the date of employment. The board of health shall provide for the examination and the physician making the examination shall report to the board of health Persons may apply to a magistrate for an order restraining such examination and no examination shall then be made except upon the order of such magistrate

Assembly Int 966—Walsh, prohibits the operating of motor vehicles while under influence of intoxicating liquors or narcotic drugs, instead of "in an intoxicated condition" as at present. Referred to the Motor Vehicles Committee

Action on Bills

At a conference on January 31, the Committee took action on the following bills

Approved

Assembly Int. 397—Burgdorf—Regulations of Public Health Council.

Assembly Int. 398—Burgdorf—Liability for damages, certain State employees

Assembly Int. 435—Flynn—Negotiating settlement for injuries

Assembly Int. 436—Flynn—Negotiating settlement for injuries in hospital or sanitarium

Assembly Int. 496—Burgdorf—Pollution of waters

Assembly Int. 556—Holley—Consumers' bureau in Health Department.

Opposed

Senate Int. 388—Feld—Practice of electrolysis

Assembly Int 439—Garcia-Rivera—Home relief recipients, medical care, etc.

Assembly Int. 492—Suitor—Motor vehicle injuries, care of indigents

Bulletin No 6

February 11, 1938

The annual conference of County Society Legislative Chairmen was held in Albany on February 9 All of the bills that were printed were studied and action taken upon them. There follows a statement of the final disposition of the bills made by the chairmen

Approved

S Int 99—Twomey, A. Int 127—Newell, Serological blood tests of pregnant women

S Int. 100—Desmond, A. Int 363—Breitbart, Serological blood tests of pregnant women

S Int. 101—Desmond, A. Int. 124—Breitbart, Pre-nuptial examinations

S Int. 459—Crawford, A Int 358—Ostertag, Sanitary regulation of trailers and tourist camps

S Int. 481—Schwartzwald, A Int 496—Burgdorf, Pollution of waters

S Int 482—Schwartzwald, A Int 397—Burgdorf, Qualifications of Public Health Council

S Int. 483—Schwartzwald, A Int. 398—Burgdorf, Liability for damages, certain Health Department employees

S Int. 637—Dunkel, Sale at wholesale of poisonous or habit-forming proprietary medicines

S Int 701—Esquirol, A. Int 157—Hawkins, Practice of radiology

A Int 183—Todd, Nurse practice

A Int 236—Schwartz, Labels on food products

A. Int. 272—Fitzpatrick, First-aid kits on railroads, etc.

A Int. 291—Breitbart, Blood-grouping tests of criminals for identification purposes

A Int 292—Breitbart, Blood tests to determine parentage of child in criminal proceedings

Approved

A. Int. 364—Brenner, Creates consumers' bureau in Health Department

A Int 556—Holley, Creates consumers' bureau in Health Department

A Int. 711—Sullivan, Defines ophthalmic dispensing

A Int 858—Fite, Physicians' lien

Opposed

S Int 117—Feld, Defines radiology

S Int 202—Stagg, A Int 287—Shaw, Treatment for infantile paralysis patients

S Int. 243—Livingston, A Int 332—Wagner, Nurse Practice

S Int. 268—Hanley, A Int 344—Canney, Division of food in Health Department

S Int 269—Hanley, A Int. 349—Canney, Division of food in Labor Department

S Int 278—Warner, A Int 443—Marble, Duplicate certificates of birth

S Int. 326—Fischel, A Int 35—Wagner, Health insurance

S Int. 327—Fischel, A Int 34—Wagner, Creates commission to study public health services in State

S Int 388—Feld, Practice of electrolysis

S Int 647—McNaboe, Examination of pupils by psychiatrist

A Int 334—Peterson, Tests for determining intoxicated drivers

A Int 339—Phelps, Future care of released State hospital patients

A Int 380—McCaffrey, Physical examination of employees

A Int. 381—Methfessel, Pre-nuptial examination to determine presence of syphilis, tuberculosis, etc

A Int 439—Garcia-Rivera, Relief recipients, allowance for medical care

Opposed

A. Int 492—Suitor Indigents suffering from motor vehicle injuries

A Int 623—Fogarty Workmen's Compensation arbitration of cases

A Int 648—Fite, Maternity subsidy

A Int 705—Flynn Inspection of hospital records by patient's attorney or former patient.

A Int. 884—Dailey Requiring physical examination of domestics

A Int 976—Sullivan, Requiring school authorities to furnish cod-liver oil for certain pupils

No Action

S Int 644—McNaboe, Commitment of certain persons to care of lunacy board

S Int 651—McNaboe, Creating State lunacy authority

A Int 351—Crews, Hours of labor of all hospital employees

A Int 435—Flynn, Statement of personal injury

A Int 436—Flynn, Statement of personal injury in hospital

A Int 966—Walsh, Prohibits driving motor vehicle while under influence of liquor or drugs

Our *Lien Bill* is now in both houses (Senate Int 869—Kleinfeld, Assembly Int 858—Fite) with the respective Judiciary Committees *Enlist your legislators' interest immediately* Remember this bill is the product of our former experience and careful study by a special committee of lawyers and physicians members of the New York Bar Association and New York County Society Last year's bill was approved by the Assembly Judiciary Committee and would have passed the Assembly except that improvement in phraseology was recommended Those recommendations are embodied in this bill

Bulletin No 7

February 14, 1938

New Bills Introduced

Senate Int 701—Esquirol, practice of radiology same as Assembly Int 157—Hawkins With the Education Committee

Senate Int 753—Feld, Assembly Int. 1073—Miss Todd provides for license and regulation of persons engaged in practice of hairdressing and cosmetology by board of seven members established in Education Department and appropriates $30,000 Referred to the Education Committee in the Senate and the Ways and Means Committee in the Assembly

Comment A similar bill passed the Legislature last year but was vetoed by the Governor That bill amended the General Business Law, this amends the Education Law We were opposed to the bill but we recognize that there is virtue in an attempt to establish a means of inspecting and regulating the various establishments and practitioners engaged in hairdressing The practice of hairdressing and cosmetology is defined as follows "To engage in the practice of hairdressing and cosmetology means and refers to a person who holds himself out, directly or indirectly, as being able, or who offers or undertakes, by any means or method, with the aid of the hands or of mechanical, electrical or other apparatus or appliances, and/or by the use of tonics, lotions, creams, cosmetics, cosmetic preparations or compounds, to wave, dye, color, bleach cut arrange dress, curl, cleanse or stimulate the growth of the hair of the head of a female person or to massage, cleanse, manipulate or exercise the scalp, face, neck or arms of such person, or to do any similar work intended to enhance the appearance of such person"

Senate Int 784—Egbert, pre-nuptial examinations, same as Assembly Int. 381—Methfessel With the Judiciary Committee.

Senate Int 790—Livingston, Assembly Int. 1079—Wadsworth, exempts from definition of dispensary State Departments of Health, Mental Hygiene and Education institutions under their jurisdiction, local health department education board or health officer, and permits them to display dispensary or clinic sign Referred to the Relief and Welfare Committees

Comment In the public schools there are dental clinics, and the Department of Health has venereal disease clinics and tuberculosis clinics Under the law at present all of these must be licensed and inspected by the Department of Social Welfare Supervision by two departments tends to create confusion and destroys efficiency Therefore, the object of this bill is to release the Department of Social Welfare from jurisdiction over clinics conducted by other State Departments leaving them solely responsible for their respective clinics

Senate Int 856—Howard provides for bi-weekly report when requested by employer from physician giving treatment to injured employee entitled to workmen's compensation for final report within forty-eight hours after last treatment and for arbitration committee to determine value of hospital services Referred to the Labor Committee.

Comment Amends the Workmen's Compensation Law by shortening the time within which the preliminary notice must be filed from twenty to ten days and requiring that the physician giving the treatment shall furnish progress reports bi-weekly when requested by either the employer the insurance carrier the industrial board or the industrial commissioner and a final report within forty-eight hours after the last treatment Failure to do any of these things shall be sufficient cause for removal from list and will prevent the physician receiving a fee when in attendance at a hearing The bill further makes new provision for aggrieved owner or operator of a medical bu-

reau or laboratory to appeal to the industrial council to be heard and to present evidence in his behalf The council shall communicate its findings to the commissioner and they shall be final

Section 13-g, subdivision 2—payment of bills for medical care—is amended by adding the following "If the parties fail to agree as to the value of hospital services rendered under this chapter, such value shall be decided by an arbitration committee consisting of two persons designated by the hospital and two persons appointed by the employer or carrier, the majority decision of such committee shall be conclusive upon the parties, and in the event of equal division, the committee shall select a fifth person whose decision shall be conclusive" And a new subdivision 4 is added providing for the payment of medical care expenses in cases where the employer has failed to secure compensation to his employees

Senate Int 869—Kleinfeld, PHYSICIANS' LIEN, same as Assembly Int. 858—Fite With the Judiciary Committee

Senate Int. 876—Miller, gives registered nurses lien on rights of action, suits, claims, counterclaims or demands of person receiving aid, care, treatment or services on account of personal injuries resulting from negligence of another Referred to the Judiciary Committee.

Comment Amends the Lien Law in favor of nurses in identically the same way as our physicians' lien bill is drafted

Senate Int 880—Quinn, inspection of hospital records, same as Assembly Int 705—Flynn With the Codes Committee

Senate Int 889—Williamson Assembly Int 1170—C Lawrence, provides for State aid to extent of forty per cent for hospitalization furnished by municipality under Public Welfare Law, and appropriates $500,000 Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly

Comment Communities were reimbursed under the TERA to the extent of forty per cent of expenses incurred in caring for families in their homes but the State never assumed a financial responsibility for medical services rendered in the hospitals These expenses had to be met by the community alone This bill would extend the State's obligation to medical expenses incurred in hospitalized cases

Senate Int 895—Feld requires Regents' Board to endorse license issued for professional practices by legally constituted board of examiners of foreign state or country and strikes out requirement that candidate so endorsed shall pass examination on subjects of licensing examination specified by statute or Regents' rule Referred to the Education Committee.

Comment The Regents have the authority in their discretion to endorse licenses of physicians from outside the State. They have in accordance with this provision, established reciprocity with certain states where the educational requirements are similar to those of this State This bill would remove their power of discretion and oblige them to endorse the license of any physician who has practiced for five years in another state or country without examination by the board in this State.

Senate Int 899—Rogers, provides for sterilization of glasses and other utensils used in preparation and service of food by drug stores, soda fountains, and other places where food is prepared and sold Referred to the Health Committee.

Assembly Int 976—Sullivan requires school authorities to provide cod-liver oil or a concentrate thereof for kindergarten and primary grade pupils Referred to the Health Committee

Assembly Int 1015—Burgdorf, defines "cannabis" to include compound, manufacture, salt, derivative, mixture or preparation of the plant Cannabis Sativa L from which the resin has not been extracted Referred to the Health Committee

Assembly Int 1016—Burgdorf changes term "habit forming" to narcotic drugs as defined in section 421 Public Health Law, for imposing fines and penalties for violations Referred to the Codes Committee.

Comment These bills were prepared by the Division of Narcotics in the Department of Health and have been approved by its advisory committee

Assembly Int. 1219—Piper, provides that ommibus with capacity of more than seven persons shall be equipped with emergency first-aid kit Referred to the Motor Vehicles Committee

Comment The bill states that the kit shall include Two packages one-inch adhesive compress (16 per package), two packages two-inch bandage compress (2 per package), one package four-inch bandage compress, two packages, sterile gauze (one yard square) two packages triangular bandage (40-inch) one package gauze bandages (3—two in by 6 yards) two packages iodine swabs (10 per package), one package ammonia inhalants (10 per package), one package ammonia ampoules (4 per package) one package burn ointment (6 per package) two packages picric acid gauze (one yard square), one package wire splint (compressed) one package drinking cups (10 per package), one package castor oil (4

tubes per package), and one package tourniquet tweezers and scissors

Assembly Int 1224—Averill, requires the Education Department to admit to examination for license to practice as registered nurse, a graduate of school of nursing accredited in any other state who has completed course of study considered by board equivalent to that required in this State, having met all other requirements, department to issue list of legally registered nurses and trained attendants, provides for disciplinary proceedings, penalties for unlawful practice, and makes other provisions Referred to the Education Committee

Action on Bills

Assembly Int. 183—Miss Todd, nurse practice bill, has been amended by changing title "nursing aide" to "practical nurse" and establishing minimum education requirements for practical nurses as completion of the grade school and one year in hospital of its equivalent.

Senate Int 117—Mr Feld has amended his radiology bill so as to exempt "any person, firm or corporation which shall have continuously and actively engaged in the operation of an x-ray laboratory for at least one year prior to July 1, 1938

Senate Int 526—Feld, nurse practice bill, has been amended to agree with amendments submitted to Assembly Int 183, as reported above

Senate Int. 591—Schwartzwald } extend
Assembly Int 797—Gugino } ing time for the report of the Cancer Commission to April 1, 1938, has passed both houses and is with the Governor for signature

JAMES H BORRELL
B WALLACE HAMILTON
JOHN L BAUER

ONE PATIENT STUDIED THOROUGHLY

Drs A A Bailey and H G Weiskotten, Syracuse, (*Journal A M A*, Dec 25, 1937), describe a procedure which has been in use at Syracuse University since 1930 in the hope that it would give the students a better point of view toward all the problems involved in adequate medical care.

The program has involved the placing of responsibility on each student for a complete study of at least one patient who has been assigned to him as a clinical clerk on the hospital wards At the beginning, the home visits connected with these studies were supervised by the hospital social worker However, such supervision tended to routinize the work of the student and failed to develop initiative and the coordination that was essential to a satisfactory point of view toward the case as a whole.

After several years of experimenting, the program has developed until it is now conducted as follows

Each clinical clerk is assigned a patient for investigation. The patient selected is one whom he has studied in the hospital from the clinical point of view An effort is made to avoid cases in which the diagnosis is doubtful and to select those cases which present individual and environmental problems The instructor may be aided by the social worker in the selection of the cases, but the student does not consult the social worker before making his study of the case

The instructor explains to the clinical clerks the significance of the investigations and outlines to them a general plan of procedure The student then visits the patient's home, interviews the family, the situation in general and drafts a rough report, giving the results of his investigation The instructor reviews this report with the student and then goes with him to the home and familiarizes himself with the situation He then discusses with the student the problems presented and, if necessary, makes suggestions for further investigation

On the completion of his study, the student prepares a report which includes a series of recommendations with regard to the adequate handling of all aspects of the case He presents this report at one of the medical seminars, which are held weekly throughout the year After the student has presented his report, the social workers are asked to comment on the case and to give any additional information they may have Each faculty member then discusses the situation from his own particular point of view and questions the student with regard to various aspects of the case The attending students participate in the discussion

The student is expected to follow his patient throughout the year and to file a supplementary report giving the final status of the patient at the end of the year Usually two reports are presented at each seminar meeting and the schedule is so arranged that each student attends four seminars and thus hears the presentation and discussion of seven cases other than his own

PNEUMONIA CONTROL

That the physicians of the State may have concrete examples of different phases of anti-pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti-pneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Case 13

Case report from the records of the Rochester Municipal Hospital, Rochester

"E. U., a twenty-six year old white male was perfectly well until February 4 when he had onset of chilly sensations, fever, malaise, and slight pain in the left side of the chest. During the next few days he developed a cough productive of muco-purulent expectoration and his symptoms gradually became worse. On February 7 the expectoration turned rusty in color, and the chest pain at that time was definitely accentuated by breathing and coughing and was referred to the tip of the left shoulder. On February 8 he called his physician who referred him to the Rochester Municipal Hospital.

"On admission, the patient was moderately ill with fever, grunting respirations, and suppressed cough. His temperature was 104.4, pulse of 120, and respirations of twenty-four. Physical examination revealed signs of consolidation at the left base posteriorly. A diagnosis of lobar pneumonia of the left lower lobe was made, and a specimen of sputum and a blood culture were sent to the laboratory immediately. An immediate (Neufeld) typing revealed type VII pneumococci in large numbers. After preliminary precautions against allergy which were negative (including history, skin and eye tests and a preliminary intravenous test of ten c.c. of 1-10 type VII antipneumococcus horse serum), serum administration was begun. Four therapeutic doses of New York State type VII antipneumococcus serum were given in about forty c.c. amounts (two vials) at about four hour intervals. The patient had an immediate crisis with the temperature, pulse and respirations returning to normal within twelve hours after serum therapy was started. Convalescence was uneventful."

Examination of the results of the treatment of type VII pneumonia with a specific type VII antipneumococcus horse serum reveals that this method of therapy is unquestionably effective in a great many cases if the serum is properly used. The case cited above is a typical favorable response of an uncomplicated case treated with adequate amounts of serum.

Since no standard therapeutic units have as yet been adopted by either New York State or the Federal Government, there is no designation of the number of units in the vial on its label.

In general, the principles underlying type VII serum therapy are reasonably similar to those for type I. The limited available evidence indicates that dosage in *number of vials* as supplied by the New York State Department of Health is but slightly greater for type VII than for type I. An uncomplicated early case may be given an average total dose of four vials. Each individual dose should consist of two vials, and these should be given at intervals of from two to four hours. Once serum therapy is started, the administration of serum at regular intervals should be continued until the desired effect is obtained or cause for failure determined. Bacteremic cases as indicated by a blood culture taken just prior to the first intravenous dose of serum require at least double the average total dose. Late cases aged patients, and cases with extensive pulmonary involvement need more serum than uncomplicated cases.

In the event that the patient does not respond after four vials have been administered the blood culture should be repeated, sputum rechecked for error or mixed infections and a careful search made for localized foci of infection such as empyema thrombophlebitis, meningitis, pericarditis, endocarditis, or otitis media.

Rabbit Serum

"Unfortunate" and "premature" publicity giving the impression that the use of rabbit serums in the treatment of pneumonia will soon result in the availability of serums highly effective against all of the thirty different types of the disease, is without scientifically accepted supporting evidence according to Dr. Edward S. Godfrey, Jr., New York State Commissioner of Health.

However, Dr. Godfrey said, it must be

understood that his criticism is directed against "premature use of a new product" and not in any way intended to discredit its ultimate usefulness or the present value of antipneumococcus horse serums, now recognized as of great value and, in fact, provided for physicians by the State

Dr Godfrey also made public a resolution of the State's advisory committee on pneumonia control, "including some of the world's outstanding authorities on pneumonia," urging against jeopardizing the future of antipneumococcus rabbit serum as a practical method of pneumonia treatment by its 'premature generalized use"

Dr Godfrey's statement follows

My attention recently has been called to a number of articles appearing in the press and prominent lay journals and an announcement over the radio, which have dealt with the subject of the use of antipneumococcus rabbit serums in the treatment of pneumonia While for the most part these presentations have been guarded, they have by implication promoted impressions which are highly misleading For example, the impression that the use of this new method of serum production will result shortly in the availability of serums highly effective in the treatment of all of the thirty different types of pneumococcus pneumonias cannot be condoned inasmuch as no convincing evidence in support of this has as yet been presented to the medical profession It is particularly unfortunate that these articles are raising the public hope that a specific serum cure has been found for the prevalent and extremely serious type of pneumonia known at Type III There is, as yet, no conclusive, scientifically accepted evidence that this is so

However, it must be understood that my comments are directed toward the premature use of a new product and not in any way intended to discredit the ultimate usefulness of this product nor the usefulness of the antipneumococcus horse serums now recognized as of great value and widely employed by physicians of this State, and, in fact, provided for their use by the State.

Pertinent to this subject, I can do no better than to quote a resolution recently adopted by a committee of prominent physicians, including some of the world's outstanding authorities on pneumonia, whom I have called together to advise me in our pneumonia control program, to quote

"Be is resolved, That it is the opinion of this committee that the therapeutic possibilities of antipneumococcus rabbit serum are such that its future as a practical method should not be jeopardized by its premature and generalized use. The committee recognizes that under certain circumstances such as bacteremic cases which are severely sensitive to horse serum or for which no horse serum is available, its use might be justified Otherwise, however, it is felt that application of this serum should be limited to clinical trial in a few selected hospitals where careful observations may be made, until such a time as the value, safety, and limitations of the method may be more accurately defined."

The Advisory Committee on Pneumonia Control of the State Department of Health, which adopted the resolution quoted by Dr Godfrey, includes the following members Chairman, Dr Russell L Cecil, Professor of Clinical Medicine, Cornell University Medical College, Dr Rufus I Cole, former director of the hospital of Rockefeller Institute, Dr Clayton W Greene, Associate Professor of Medicine, University of Buffalo and member of the New York State Public Health Council, Dr G M Mackenzie, Physician-in-Chief of the Mary Imogene Bassett Hospital of Cooperstown, Dr O W H Mitchell, Professor of Bacteriology, Hygiene and Sanitation, Syracuse University College of Medicine, Dr George H Ramsey, Assistant Commissioner for Preventable Diseases, New York State Department of Health, Dr Donald B Armstrong, Third Vice-President of the Metropolitan Life Insurance Company, Dr Thomas P Farmer, Chairman of the Committee on Medical Education of the New York State Medical Society, Dr Peter Irving, Editor of the *State Medical Journal* and Secretary of the State Medical Society, Dr William S Mc Cann, Professor of Medicine, Rochester University, Dr Ralph S Muckenfuss, Director, Bureau of Laboratories, New York City Department of Health, Dr Augustus B Wadsworth, Director, Division of Laboratories and Research, New York State Department of Health, and Dr Arthur W Wright, Professor of Pathology and Bacteriology, Albany Medical College

PREVENTION OF CRUELTY TO PRESIDENTS

Dr Mortimer G Brown, retiring president of the Syracuse Academy of Medicine, remarked in his farewell address that a haunting ghost reminded him daily and nightly, throughout the year of his incumbency, that the day was coming when pen must be taken in hand and an address written—for like taxes, there was no escaping the annual delivery of the President's address He suggested that another alphabetical committee be appointed, in keeping with the times, and that it be called the N C P P A, viz, a National Committee for the Prevention of Presidential Addresses

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

STATE OFFICERS AND MEMBERS of the Executive Board of the Woman's Auxiliary to the Medical Society of the State of New York arrived in Syracuse on the afternoon of February 9 to attend an all-day board meeting on February 10, at the home of the President, Mrs Francis Irving, at 119 Wendall Terrace

Activities for the visitors, who were guests at the homes of the Syracuse Board members, opened with a buffet supper Wednesday evening at the home of the President of Onondaga County Auxiliary, Mrs H. Walden Retan, and included a dinner at the home of Mrs Carlton Potter

The business session of the Board opened February 10 at 10 00 A M The meeting adjourned at 1 00 P M when Mrs Irving was hostess at a luncheon, and reconvened at 2 30 P M Reports of County Presidents were read, and plans discussed for the Convention May 9-12 at the Waldorf-Astoria, New York City

Officers attending were Mrs Daniel Swan, Flushing, L I, President-Elect, Mrs Luther Kice, Garden City, 2nd Vice-President, Mrs Henry L Hirsch, Rockville Centre, Recording Secretary, Mrs John L Bauer, Brooklyn, Mrs James M Dobbins, Long Island City, Mrs Charles H Goodrich, Brooklyn, and Mrs Harry Bull, Auburn, Directors

Chairmen of Standing Committees attending were Mrs Sedgwick Austin, Auburn, Mrs Edwin A Griffin, Brooklyn, Mrs Louis A VanKleeck, Manhasset, Mrs Milton B Bergmann, Brooklyn, Mrs S W S Toms, Nyack, and Mrs John W Mahoney, Bayside

County Presidents attending were Mrs Raymond F Johnson, Cayuga County, Mrs Harlow Farmer, Jefferson County, Mrs Robert Crockett, Madison County, Mrs Louis M Lally, Nassau County, Mrs Elmer Kleefield, Queens County, Mrs G Scott Towne, Saratoga County, Mrs Herman W Galster, Schenectady County, and Mrs J H Donnelly, Rensselaer County

The Syracuse members attending were Mrs Francis Irving, President, Mrs Edgar Neptune, Corresponding Secretary, Mrs Carlton Potter, Treasurer, Mrs John J Buettner, Organization Chairman, Mrs Horace Whitely, Jordan, Supplies Chairman, and Mrs H Walden Retan, President of Onondaga County Auxiliary

SCHENECTADY COUNTY The Woman's Auxiliary held a dinner dance instead of its regular meeting at the Mohawk Golf Club on February 24 This was the first time the Doctors have met with the Woman's Auxiliary and it was a successful affair

QUEENS COUNTY The Board meeting of the Auxiliary was held on February 1st, at the Medical Society's building

The Chairman of the Entertainment Committee, Mrs Henry Eichacker, appointed Mrs Daniel Swan in charge of table prizes, Mrs Thomas d'Angelo in charge of special prizes and Mrs James M Dobbins in charge of door prizes for the Bridge and Tea held at the Forest Hills Inn on February 16

On February 4, Mrs Howard Neail attended the New York City Federation of Women's Clubs as guest of honor

At the meeting held on February 24, Mrs E H Dare, Jr, Long Island Traffic Representative of the United Airlines, gave a lecture, illustrated with motion pictures, on "Coast to Coast Travel by Plane" The motion picture was of an overnight trip on the new plane, "The Continental," showing what happens behind the scenes

ONONDAGA COUNTY The February meeting of the Woman's Auxiliary to the Onondaga Medical Society was held February 1, at the Crouse Irving Hospital

Dr Joseph Lawrence, Executive Officer of the State Medical Society, was the guest speaker Dr J J Buettner also spoke, and Mrs Katherine Scott Sykes gave a reading Mrs Carl Muench was Chairman of the hostesses

---

"In the health of the public lies the wealth of the nation"—Gladstone

understood that his criticism is directed against 'premature use of a new product" and not in any way intended to discredit its ultimate usefulness or the present value of antipneumococcus horse serums, now recognized as of great value and, in fact, provided for physicians by the State.

Dr Godfrey also made public a resolution of the State's advisory committee on pneumonia control, "including some of the world's outstanding authorities on pneumonia," urging against jeopardizing the future of antipneumococcus rabbit serum as a practical method of pneumonia treatment by its 'premature generalized use"

Dr Godfrey's statement follows

My attention recently has been called to a number of articles appearing in the press and prominent lay journals and an announcement over the radio, which have dealt with the subject of the use of antipneumococcus rabbit serums in the treatment of pneumonia While for the most part these presentations have been guarded, they have by implication promoted impressions which are highly misleading For example, the impression that the use of this new method of serum production will result shortly in the availability of serums highly effective in the treatment of all of the thirty different types of pneumococcus pneumonias cannot be condoned inasmuch as no convincing evidence in support of this has as yet been presented to the medical profession It is particularly unfortunate that these articles are raising the public hope that a specific serum cure has been found for the prevalent and extremely serious type of pneumonia known at Type III There is, as yet, no conclusive, scientifically accepted evidence that this is so

However, it must be understood that my comments are directed toward the premature use of a new product and not in any way intended to discredit the ultimate usefulness of this product nor the usefulness of the antipneumococcus horse serums now recognized as of great value and widely employed by physicians of this State, and, in fact, provided for their use by the State.

Pertinent to this subject, I can do no better than to quote a resolution recently adopted by a committee of prominent physicians, including some of the world's outstanding authorities on pneumonia, whom I have called together to advise me in our pneumonia control program, to quote

"*Be is resolved,* That it is the opinion of this committee that the therapeutic possibilities of antipneumococcus rabbit serum are such that its future as a practical method should not be jeopardized by its premature and generalized use. The committee recognizes that under certain circumstances such as bacteremic cases which are severely sensitive to horse serum or for which no horse serum is available, its use might be justified Otherwise, however, it is felt that application of this serum should be limited to clinical trial in a few selected hospitals where careful observations may be made, until such a time as the value, safety, and limitations of the method may be more accurately defined."

The Advisory Committee on Pneumonia Control of the State Department of Health, which adopted the resolution quoted by Dr Godfrey, includes the following members Chairman, Dr Russell L Cecil, Professor of Clinical Medicine, Cornell University Medical College, Dr Rufus I Cole, former director of the hospital of Rockefeller Institute, Dr Clayton W Greene, Associate Professor of Medicine, University of Buffalo and member of the New York State Public Health Council, Dr G M Mackenzie, Physician-in-Chief of the Mary Imogene Bassett Hospital of Cooperstown, Dr O W H Mitchell, Professor of Bacteriology, Hygiene and Sanitation, Syracuse University College of Medicine, Dr George H Ramsey, Assistant Commissioner for Preventable Diseases, New York State Department of Health, Dr Donald B Armstrong, Third Vice-President of the Metropolitan Life Insurance Company, Dr Thomas P Farmer, Chairman of the Committee on Medical Education of the New York State Medical Society, Dr Peter Irving, Editor of the *State Medical Journal* and Secretary of the State Medical Society, Dr William S McCann, Professor of Medicine, Rochester University, Dr Ralph S Muckenfuss, Director, Bureau of Laboratories, New York City Department of Health, Dr Augustus B Wadsworth, Director, Division of Laboratories and Research, New York State Department of Health, and Dr Arthur W Wright, Professor of Pathology and Bacteriology, Albany Medical College

PREVENTION OF CRUELTY TO PRESIDENTS

Dr Mortimer G Brown, retiring president of the Syracuse Academy of Medicine, remarked in his farewell address that a haunting ghost reminded him daily and nightly, throughout the year of his incumbency, that the day was coming when pen must be taken in hand and an address written—for like taxes, there was no escaping the annual delivery of the President's address He suggested that another alphabetical committee be appointed, in keeping with the times, and that it be called the N C P P A, viz, a National Committee for the Prevention of Presidential Addresses

Medical News

Albany County

THE MEDICAL SOCIETY of Albany County heard Dr George Packer Berry, professor of bacteriology at University of Rochester School of Medicine and Dentistry on January 26 at Albany College of Pharmacy He discussed filterable viruses, with lantern slide illustration

Bronx County

THE BRONX COUNTY MEDICAL SOCIETY, at its meeting on January 19 at Burnside Manor, heard this program

Campaign for Cleanliness in Bronx Borough by Jerome Meyers, M D, Director, Mott Haven Health Center "Diagnosis and Surgical Treatment of Carcinoma of the Breast" by Dr Milton R. Bookman "Radiation Therapy of Carcinoma of the Breast" by Dr Frank E Adair "Carcinoma of the Breast—Sound Film in Color" by Dr Herbert C Chase

Cayuga County

EDWARD S ROGERS, M D, Director Bureau of Pneumonia Control, State Department of Health, was the speaker at the January meeting of the Medical Society of the County of Cayuga

His subject was "Pneumonia Control" and he showed two motion picture films on the intravenous treatment of pneumonia and nursing care of pneumonia

The program was interesting and educational and the men entered freely in the discussion—*Reported by S J Karpenski, M D, Secy*

Chautauqua County

DR JOHN J MORTON, JR, professor of surgery, University of Rochester, spoke on "Herniation Through the Diaphragm," at the meeting of the Jamestown Medical Society on January 27 The discussion was opened by Dr Charles E Goodell The next meeting was held on February 24 when Dr Russell Haden of the Department of Medicine, Cleveland Clinic, spoke on "Clinical Problem of Deficiency Disease." Dr Frank P Goodwin opened the discussion

Clinton County

THE NEW OFFICERS OF THE Clinton County Medical Society are

President	Sidney Mitchell, Plattsburg
Vice President	E A Wessell, Plattsburg
Secretary	A S Schneider, Plattsburg
Treasurer	K H Clough, Plattsburg

Reported by Anton S Schneider, M.D., Secy

Cortland County

DR BREWSTER C DOUST addressed the Cortland County Society, on January 21, on "The Private Practitioner and Immunization" Dr Doust pointed out the possibilities within reach of all practitioners who were ready to aid in community health work

Essex County

THE OFFICERS OF THE Medical Society of the County of Essex for 1938 are

President	T R. Cummins, Ticonderoga
Vice-President	Violet McCasland Moriah
Secy and Treas	Louis H Gaus, Ticonderoga

Reported by Louis H Gaus, M D, Sec'y

Kings County

THE FOLLOWING SCIENTIFIC PROGRAM was presented at the meeting of the Medical Society of the County of Kings on January 18 "Medicine in a Changing Social Order," John B D'Albora, M D, F A C P "Studies to Evaluate the Zinc Sulphate Spray in the Prevention of Poliomyelitis," Mervin C Myerson, M D "Problem in Proctology Encountered by the General Practitioner, the Internist and the Surgeon," Louis A Buie, M D, F A C S, Rochester, Minn

The program on February 15 included "The Heart in Surgical Patients," Harold E B Pardee, M D "The Evolution of Our Knowledge of Heart Disease," P Dudley White, M D, Boston, Mass

BROOKLYN PHYSICIANS ARE looking forward to a library second to none in the country, the creation of which was aided in large measure by the proceeds of the dinner honoring Dr Charles H Goodrich, president of the New York State Medical Society, at the Hotel Astor, Manhattan, on Washington's birthday

Public Health News

Tuberculosis in Amsterdam

J Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

There are some physicians who are not yet sufficiently "tuberculosis conscious"

Better case-finding procedures are needed to detect cases in the earliest, frequently symptomless, stages of the disease

These are two of the conclusions evolved from a survey of tuberculosis in the city of Amsterdam The study was undertaken in November 1935 as a result of the observation that the tuberculosis death rate in this city had been for several years consistently higher than for other cities of similar size in this state, the average annual rate for 1929–33 inclusive being 73 5 for Amsterdam and 53 4 for cities in upstate New York with populations of 25,000 to 50,000 Dr Gordon R Gray, District Epidemiologist, made a detailed study of the nineteen deaths and twenty-one cases of pulmonary tuberculosis reported among residents of the city in 1934

At the time of diagnosis six cases were "far advanced" ten "moderately advanced," and one "minimal" Diagnosis resulted in every case through consultation for medical advice on account of symptoms No case had been discovered in this year through examination of contacts although seven of the seventeen cases were "household contacts" of previously known cases and five others had been exposed to extra-household infection Not only were the cases late in securing medical advice but a further period of delay occurred in placing them under treatment Three cases were diagnosed within the first two weeks of consulting a physician The interval in the other cases extended from one to thirty-seven months

There was less delay in securing sanatorium care after diagnosis Eight patients were hospitalized within a week Three patients received no sanatorium care However, five patients left the sanatorium against advice, three because they were dissatisfied with the service received and one in order to spend the summer in his camp The fifth was admitted against her will and left as soon as she became well enough to insist on leaving Mimeographed copies of the complete report may be obtained by writing to the District Office, New York State Department of Health 268 Guy Park Avenue, Amsterdam, N Y

Attendance at Society Meetings

In a recent letter I discussed the attendance of health officers at County Society Meetings In his January report to the Public Health Council, Dr Don M Griswold records addresses given to three County Societies with the following attendances of practicing physicians

Ontario County	63 out of possible 83
Seneca County	16 out of possible 20
Yates County	18 out of possible 20

These figures show a real interest on the part of the profession in receiving the gospel of public health

Hess Ambulance Incubator

A table published in this column on January 15 showed the excessive risk of neonatal mortality run by prematurely born infants As one measure to combat this source of infant mortality, the Syracuse City Health Department has purchased a Hess ambulance incubator Drs G D Mahar and B C Doust have arranged a program for its use. The incubator is housed at the Syracuse Memorial Hospital When attending physicians have a case which they wish to have hospitalized, an intern goes out with the Health Department nurse to pick up the premature infant.

Dr John Horni, chief of the surgical division of Beth Moses Hospital since its inception seventeen years ago, who recently retired from active service, was guest at a dinner sponsored by the medical board and medical staff of the hospital on January 28 at the Hotel St George in Brooklyn

their knowledge so they more adequately take care of individuals in need of medical service.

Nassau County

THE MEDICAL SOCIETY of the County of Nassau, at its meeting on January 25, listened to a paper on "Another Year of Sulfanilamide" by Perrin H Long, M D, Associate in Medicine, the Johns Hopkins University Medical School, Assistant Physician, the Johns Hopkins Hospital

DR. GUY FORSYTH CLEGHORN, Mineola health officer, died on February 6 at his home. He was fifty-nine. Besides being health officer, Dr Cleghorn was medical inspector of the Mineola public schools and physician at the Nassau County jail In 1925, he was president of the Medical Society of Nassau County

New York County

A LECTURE SERIES UNDER the joint auspices of the New York Academy of Medicine and the Board of Education on "The Health of the Pupil" is being presented this year, it is announced. The first of the fourteen lectures was given at the Academy on February 9 at 4 p m Dr Dorothy B Nyswander discussed "The Teacher's Responsibility for the Health of Her Pupils"

AN INQUIRY BY Dr David J Kaliski, relative to the new parking regulations in New York City, elicited from the Police Department the information that "The manual of Procedure of this Department provides that physicians are permitted to leave their cars in front of premises wherein they are actually attending a patient for such length of time as may be necessary for that purpose

"Please be assured that members of the Department assigned to enforce the new regulations have been instructed to show due consideration and allow sufficient latitude when circumstances deem it necessary"

A DINNER-DANCE OF THE Italian Physicians in America was held on the evening of February 12 at the Plaza Hotel

DR. MILTON A BRIDGES, Assistant Professor of Clinical Medicine, New York Postgraduate School, Columbia University, will speak at the New York Academy of Medicine on March 4 at 4 30 on "The Evaluation of Recent Therapeutic Procedures"

DR. RUSSELL L CECIL will give a lecture on March 2 on "Bacterial Endocarditis" at the New York Polyclinic Medical School and Hospital

DR THOMAS T MACKIE, Research Associate, Cornell University Medical College, will speak at the New York Academy of Medicine on March 11 at 4 30 on 'Various Types of Colitis"

DR. HAROLD J STEWART will speak at Cornell University Medical College, Room B-07, on March 15 at 4 30 on "The Management of Hypertension"

DR. JAMES RALPH SCOTT, Chairman of the New York Diabetes Association, will speak at the New York Academy of Medicine on March 18 at 4 30 on "The Modern Treatment of Diabetes Mellitus"

EDWARD ELWAY FREE, PH D, will speak at the New York Academy of Medicine on March 24 at 8 15 P M on "The Physicists' Contribution to Medicine."

Onondaga County

A 15-MINUTE TALKIE film on "Pneumonia" was shown at the meeting of the Onondaga County Medical Society on February 1, by courtesy of the state department of health The scientific program on disturbances of the blood-forming organs was

"Some Problems of Diagnosis and Treatment" by Dr Ellery G Allen.

"Pernicious Anemia Treatment of the Ambulatory Patient" by Dr A. Carl Hofmann.

"The Value of Detailed Leucocyte Studies in Surgical Cases" by Dr John VanDuyn, 2nd

"A Case of Macrocytic Anemia" by Dr Sidney A. Britten

Discussion was opened by Dr W A. Groat

THE SYRACUSE ACADEMY OF MEDICINE met at the University Club on February 15 and listened to a program arranged by the staff of St Joseph's Hospital

THE INCREASING NUMBER OF deaths from heart disease are attributable to three main factors, Dr Wilhelm Dressler, Vienna heart specialist, explained at a dinner given in his honor in Hotel Syracuse under the

Almost a century old, the Kings County Medical Society library, rich in historical and biographic medical material, is the fourth largest in the nation Extended for reference use, without limitation, to medical men from neighboring States, member physicians have found that there is insufficient room for all who visit the library to work

Proceeds from the dinner, sponsored by the Medical Society and the Academy of Medicine of Brooklyn and attended by notables from the medical and other professions, will go to swell the Frank D Jennings Memorial Building Fund, with which the society will erect a new building adjacent to its present home to house its ever-expanding activities

The dinner marks the first step in the fund-raising campaign, for which a quota of $500,000 has been set The first activity to be expanded, campaign officials have said, will be the library

THE FRIDAY AFTERNOON lectures at 4 30 in the MacNaughton Auditorium in March include

March 4—"Pneumencephalography in the Diagnosis of Diseases of the Brain," Leo M Davidoff, M D

March 11—"What the General Practitioner Should Know About Bronchoscopy," Robert L Moorhead, M D

March 18—"Cutaneous Syphilis," Howard Fox, M D

THE RIDGE BORO MEDICAL Society held its regular meeting on February 10 "Traumatic Surgery in Office Practice" was the subject of a talk by Dr Angelo L Soresi, attending surgeon of the Greenpoint Hospital

THE BROOKLYN THORACIC SOCIETY met on January 21 at the Kingston Ave Hospital Papers on various aspects of tuberculosis were presented by Henry D Fearon, M D, Harry Meyersburg, M D, Abraham V Shapiro, M D, A W Martin Marino, M D, Alfred M Buda, M D and Isaac Skir, M D At the meeting on February 18, the program was as follows "Recognition and Management of Early Tuberculosis" by J Arthur Myers, M D, President, National Tuberculosis Association, Professor, Preventive Medicine, University of Minnesota Medical School Discussion was opened by J Burns Amberson, M D

DR. HENRY J GOUBEAUD SR, a general practitioner in Brooklyn for forty-eight years, died at his home after a brief illness of pneumonia, on February 1

DR. NORMAN PHILIP GEIS, for many years a leading surgeon of Brooklyn until he retired from active practice about thirteen years ago, died on February 5 in the Medical Center, Manhattan, where he had undergone an operation He was sixty-four

Monroe County

THE LYON HOMESTEAD ON East Avenue in Rochester has been presented to the Rochester Academy of Medicine

Providing headquarters for the city and the county medical fraternity, the home was presented by Mrs J Howard Kidd, Mrs Francis K Remington and Mrs John Van Voorhis "as a suitable memorial to the high humanitarian and cultural ideals our parents, Mr and Mrs Edmund Lyon, represented during their lifetime"

In accepting the gift in the name of the academy Dr Kaiser declared the building and grounds will constitute one of the outstanding medical homes in the country It will serve as headquarters for the Academy, the Monroe County Medical Society, the Rochester Pathological Society and various health activities

With funds from the Academy Memorial Fund Campaign, expected to reach approximately $150,000, the academy will provide an endowment and make changes in the building to house its auditorium, library and museum

Commenting on the gift Dr Leo F Simpson, county medical society president, said "The Lyon house will be an educational and cultural center, a great repository of medical knowledge which will be translated into the prevention of disease and the relief of suffering for many generations

"I believe that those who have made this gift have, in reality, said to their parents, 'we have admitted to our home over 500 disciples of your philosophy of life In the rooms you loved so well, they will study and confer, helping one another, to the end that an unceasing flow of benefits will come to our entire community'"

Expressing the appreciation of the Rochester Pathological Society, John J Rooney, president, stated the new home would serve as an inspiration to physicians who have devoted themselves to furthering

their knowledge so they more adequately take care of individuals in need of medical service

Nassau County

THE MEDICAL SOCIETY of the County of Nassau, at its meeting on January 25, listened to a paper on "Another Year of Sulfanilamide" by Perrin H Long, M D, Associate in Medicine, the Johns Hopkins University Medical School, Assistant Physician, the Johns Hopkins Hospital

DR. GUY FORSYTH CLEGHORN, Mineola health officer, died on February 6 at his home. He was fifty-nine Besides being health officer, Dr Cleghorn was medical inspector of the Mineola public schools and *physician at the Nassau County jail* In 1925, he was president of the Medical Society of Nassau County

New York County

A LECTURE SERIES UNDER the joint auspices of the New York Academy of Medicine and the Board of Education on "The Health of the Pupil" is being presented this year, it is announced. "A Case of Macrocytic Anemia" by Dr *Sidney A Britten*

Discussion was opened by Dr W A. Groat.

THE SYRACUSE ACADEMY OF MEDICINE met at the University Club on February 15 and listened to a program arranged by the staff of St Joseph's Hospital

THE INCREASING NUMBER OF deaths from heart disease are attributable to three main factors, Dr Wilhelm Dressler, Vienna heart specialist, explained at a dinner given in his honor in Hotel Syracuse under the

auspices of the heart committee of the Onondaga Health Association, on January 26

The first factor he considered to be the decrease in deaths from infectious diseases, thus allowing persons to live longer and become of an age when heart disease is likely to develop

Second was the greater ability of doctors to diagnose heart ailments The speedier pace of living came third

SYRACUSE WILL ENTER THE annual nationwide health contest sponsored by the United States Chamber of Commerce and the American Medical Association, Frederick E Norton, executive secretary of the local Chamber, announces

Winner of the national contest a year and two years ago, Syracuse will compete with hundreds of other communities in its population group for special recognition in health work

Because of the previous victories, Syracuse this year will be ineligible for the first award, but will qualify for a special certificate of merit, Mr Norton said However, this city can compete for the first award next year

Dr H Burton Doust, commissioner of health, who is a member of the Chamber's health committee, is preparing data on which Syracuse's claim as one of the healthiest cities in the country will be based

It is considered likely that Syracuse will participate in two other contests sponsored by the national Chamber and the medical association Both are based on the fight against tuberculosis and syphilis

Putnam County

DR. HENRY W MILLER addressed the Putnam County Medical Society on February 2 at the Carmel Country Club His subject was "Psychiatry and the General Practitioner"

Reported by Dr John T Jenkin, Secy

Queens County

DR. MORRIS FISHBEIN was the guest speaker at the meeting of the Medical Society of the County of Queens on February 24

The Friday afternoon talk on February 4 was on "Diagnosis of Neurosis from Organic Disease" by I S Wechsler, M D, and on February 18, was on "Diagnosis and Treatment of Syphilitic Heart Disease" by Clarence De la Chapelle, M D

DISTINGUISHED MEMBERS of the bench and bar joined with leaders of the medical profession in Queens on January 27 in paying tribute to Dr Walter Guernsey Frey, who marks this year his fiftieth anniversary as a family physician in the Long Island City area.

Dr Frey was guest for the occasion at a dinner given for him by the Long Island City Medical Society at the Hotel Commodore, Manhattan More than 150 persons attended

Dr Frey has the distinction of having served in the Long Island City section for a longer continuous period than any other practitioner He was seventy-five on February 15

Dr Frey was president of the County Medical Society in 1913, when it was known as the Queens-Nassau Medical Society

Suffolk County

THE SUFFOLK COUNTY MEDICAL Society had a luncheon meeting at St Charles Hospital in Port Jefferson on January 26. There were about sixty doctors present Dr Frank Child demonstrated the various treatments for infantile paralysis in all its stages Dr Child was reelected president of the Suffolk County Tuberculosis and Health Association at its annual meeting on January 10

Warren County

DISCUSSION OF THE various types of anesthesia as administered in metropolitan hospitals marked the meeting of the Glens Falls Academy of Medicine on January 28 in Crandall Library Dr Frank W Marvin of Boston, was the principal speaker Dr Marvin's address was illustrated by stereopticon slides and was followed by a general discussion

Dr F A. D Alexander, professor of anesthesia at Albany Medical College, opened the general discussion in which Dr W W Bowen, Dr D A Zurlo and others participated Approximately sixty physicians from Albany, Saratoga and other communities in the tri-county area surrounding Glens Falls attended the meeting

Dr Marvin, who is assistant professor of anesthesia at Tufts College Medical

School and visiting anaesthetist at Boston City Hospital, Boston Lying-In Hospital and at Carney and Newton Hospitals, was guest of honor at a dinner in The Queensbury previous to the Academy meeting

Westchester County

THE PROBLEM OF HEALTH EXAMINATIONS for domestic servants was discussed on February 2 by Dr Fairfax Hall, in a talk before the Greenwich Rotary Club, at its weekly luncheon-meeting at the Pickwick Arms

Although adults in a home are possibly only liable to contract typhoid fever, or colds from servants, tuberculosis is the great danger among children and this disease has often been traced, he said.

Dr Hall told how examination of maids is now compulsory in Newark, N J, and in North Carolina.

Passage of an ordinance is difficult, as was shown in New Rochelle, Dr Hall said, because domestics claimed that it was class legislation, and argued that if employes were to be examined, employers, school teachers and parents should likewise undergo examinations, since they were in even closer contact with children

An ordinance of that kind, Dr Hall believes, would also bring about a scarcity of servants in a community, since they would go elsewhere to obtain work.

The speaker expressed the opinion that every employer has a right to know whether or not his or her servants are healthy, and the solution of the problem lies in having examinations taken on a voluntary basis, as is now the case in Knoxville, Tenn.

Harry L. Nado, executive secretary of the Greenwich Chamber of Commerce, told how the health committee of the Chamber and the health committee of the Community Chest had obtained an appropriation of $500 some time ago for having peanut venders examined. The committee has been working along the same lines as suggested by Dr Hall and he expressed the belief that employers should set the example to domestics by undergoing examinations themselves

"PNEUMONIA CONTROL THROUGH popular education affords a striking example of the power of accurate information to save human lives," said Dr Peter Irving, secretary, Medical Society of the State of New York, at Yonkers on February 10

"Pneumonia has come to be classed as an emergency just as truly as appendicitis is an emergency," said Dr Irving "This changed aspect is due to the development of the use of serum as an adjunct in the treatment of some cases To be most effective, the serum must be administered within a day or two after the onset of the disease Hence immediate diagnosis has assumed greater importance, and this calls for recognition of symptoms by the physician and before that recognition of danger by the patient and his family It is perfectly useless for science to provide the doctor with a valuable tool to add to his technic, when the cases which need it do not come to him in time for it to be used to advantage."

Dr Irving spoke at a meeting sponsored by the Yonkers Health Department, the Academy of Medicine, and the leading health and welfare organizations The meeting was the third of a series on pneumonia, and will be followed, every alternate week, by similar forums on such subjects as heart disease diabetes maternal welfare and cancer The meetings have been arranged by Dr Eugene F McGillian, Commissioner of Health of Yonkers

---

NOTICE TO SECRETARIES OF MEDICAL SOCIETIES

Attention is called to the facilities and services extended to hospital groups, clinical societies, medical clubs, nurses' associations, and the profession generally by the Bureau of Social Hygiene of the New York City Department of Health, in connection with the venereal disease control program

Competent speakers on any aspect of venereal disease, together with slides, motion picture films, and leaflets, are offered for meetings of such groups Entire programs, or individual presentations, will be arranged for appropriate medical and nursing groups on desired subjects

All requests should be directed to the Director of the Bureau of Social Hygiene, 125 Worth Street, New York City or telephone WOrth 2-6900

Hospital News

Hospitals Balk at C I O Measure

STATEWIDE OPPOSITION TO A CIO-sponsored bill, introduced in the Assembly and calling for a mandatory eight-hour day for hospital employees, is voiced by Frederick A Sharp, executive director of the White Plains Hospital

Speaking as a member of the Hospital Association of New York State, which has launched a fight to defeat the bill, Mr Sharp said

This is an attempt to apply standard industrial regulations to hospital operations The application is not practicable, and it is not fair Hospital operations are controlled by human needs and not by production schedules You can't apply the same rules to the operation of a hospital as you would apply to a factory

For a great many of the hospitals in New York State, a straight eight-hour day for employees would mean a salary cut, or an increase in rates—or both Hospitals are public institutions—not profit-making enterprises An increase in rates, generally, would decrease use of our hospitals, and lead many of our institutions into financial disaster

All hospitals in the state association favor the principle of the eight-hour day, and are working earnestly towards the point where it can be adopted generally without destroying hospital routine and imposing an unbearable financial strain

Lawmakers Get Protests

Legislators throughout the state have been hearing from hospital officials since Assemblyman Crews of Brooklyn introduced the bill, at the request of the Association of Hospital and Medical Employees, No 413, C I O

Leaders in the State Hospital Association say that imposition of the eight-hour day at this time would be not only a financial blow to most of the hospitals in upstate New York, but in many instances would force a decrease in the high standards of service maintained by many small, meagerly endowed institutions which are hard pressed to meet current expenses

Some of the newspapers around the state have felt that this matter deserves comment, and the Amsterdam *Recorder Democrat* observes in a thoughtful editorial

We would be very glad to see employees of hospitals get higher wages Their work is onerous in the extreme, hours are plenty long, and the pay is none too good All these things seem to be self-evident, and are not disputed by hospital managements But hospital service can not be regulated by hard and fast standards as to hours Time is of the essence, as they say, in the care of the sick, and hundreds of hospitals receive the slenderest of financial support.

Unhappy Alternative

It seems quite obvious that if an eight-hour day is to be made mandatory in such institutions, one of three things must happen in many instances, and in some cases all of them. Either the wages of employees must be reduced to the level where hospitals can carry them under their budget plans, or the service charges must be increased, or the standard of service lowered.

Sickness is a hard master It awaits no man's time and opportunity Those who have the responsibility of running hospitals cannot be delayed in an emergency to argue with an employee as to whether his eight hours is up. The ability to command service from an employee at any time or place may spell the difference between life and death for a patient. Those who do not believe this should try to explain to the family of someone who was the victim of such unthinkable circumstances that they are sorry they could not save the dear one's life, because Local 23 of the Hospital Employees' Union was called off duty at the very moment it was inadvisable to leave.

No, hospital work is a good deal like that of the newspaper reporter It demands much Those who engage in such a vocation from any other motive than pure love of the thing have no business in it. Hours do not greatly matter, whatever any union may say

Group Patients Save Millions

THE RICH CASH SAVINGS ENJOYED by patients hospitalized under the group plan were figured out at a meeting of the plan executives of the state in Rochester on Jan 28 and 29 In Syracuse the subscribers who were treated in the hospitals saved $100,000, the Bronx members hospitalized in the past 2½ years saved $240,000 in their

bills, the ones in Queens and Long Island saved $728,000, and in the entire state the members who went to hospitals saved $5,000,000 The difference, of course, was paid by the dues of the members who required no hospital treatment. The hospitals reckon that their income is greater under the plan than it was before, so that everybody is satisfied.

Approximately 750,000 New York State residents have enrolled in the last two and a half years in plans in Rochester, Buffalo, Albany, Geneva, Jamestown, Syracuse, Utica, Watertown, and New York City

Executives will attempt to work out a plan which would entitle the subscribing patient the same benefits of serums, oxygen, operating room and ambulance costs away from his home as he now receives in his home city

Binghamton has just joined the plan and Batavia is expected to come in at an early date. Rochester executives say that more than a third of the city's population will be on the rolls by the end of this year

Hospital Exhibit at the Big Fair

ONE SECTION OF THE HALL of Medical Science at the New York World's Fair in 1939 is to be devoted to hospitals and organized care of the sick, to show how many departments and persons are involved in service to an ailing individual. The multiplex details of hospital administration are to be revealed by lifelike figures centering about a patient in a hospital cot. There will be the doctor and the nurse, the only ones of the hospital staff with whom he has contact. But grouped elsewhere in the dramatic model will be shown the departments which provide service for him—the admission office, the laboratory, pharmacy, housekeeping, dietary, laundry, and light and power agencies

Demonstration of the financial side of the hospital is to be effected graphically by having the four legs of a hospital cot made of stacked silver dollars. Of these dollars, sixty per cent come from the patient, thirty per cent from State, county or municipal government, and the ten per cent remainder from endowment. Fifty per cent of this income is spent for food and equipment.

What the piled dollars are to demonstrate is that the cot cannot stand level if the thirty per cent or the ten per cent be missing

There will be an animated story of persons going through hospitalization—old and young, rich and poor, youths and babies—from admission to assignment to ward or room, preliminary examination, the calling in of specialists in special cases An operating room will be shown, with the surgeon in white gown and mask, gloved and instrument in hand, with attendant nurses. Next will be a representation of a patient's period of convalescence and, lastly, discharged from the hospital, a well, whole being

Nursing Taught by Movie

"SEEING AND DOING" are two great bases of education, and as the movie permits us to see what is doing, then why not use it to teach, for instance, nursing? That was the idea that came to members of the faculty of the University of Minnesota in 1934, so they filmed some of the nursing technics, tried it out in the classes, and found it so satisfactory that they have used it ever since. Louise Waagen, R.N, tells about it in *The Modern Hospital* They use films of the open bed, morning care, evening care, temperatures, pulse and respiration, hot foot bath, bed bath, treatment for pediculosis and a shampoo in bed, and the removable backrest The films were sent to Chicago and Hollywood for developing, but the cutting and previewing were done at the University Out of 6,000 feet of negative taken, about 4,000 were finally used The cost, exclusive of salaries, was $1,200

A lecture precedes the showing of the picture, to prepare the students' minds, so that they will get the most possible out of it, then it is run twice, with time for questions and explanations between, and after two or three days of actual practice it is run a third time.

Weighing the Pro and Con

The advantages and disadvantages of the movie method are then stated. First, the advantages

1 The films represent a uniformity of technic regardless of the number of times repeated. There is no chance of error or loss in continuity in personal demonstrations Students in the school of nursing are rotated among four hospitals to complete required experiences By use of these films, instructors in the respective institutions can feel assured of a uniformity as to the method in which the technics are taught.

2 The films are definitely time-saving for the instructor By the old method, the teacher spent a disproportionate amount of time in the collection of equipment and in teaching time. Not only was time spent before the class began, but afterward, as well, when all of the materials had to be put away Time can, obviously, be much more effectively spent supervising the bedside work of the student nurse.

3 The value of repetition in effective teaching and learning cannot be denied. This is an important point, with the films the same technic can be shown twice in the time required for one personal demonstration.

The advantages far outweigh the disadvantages Nevertheless, there are three disadvantageous points to be borne in mind

1 With the movie method, chiefly technics can be shown. The teachers, however, by example and lecture, may stimulate the student to realize the meaning of "fine nursing" and "personal interest" in the patients

2 It is obviously difficult to portray the adaptability of the various technics, such as the care of the patients with casts, traction, special surgical dressings, and in oxygen tents These films are meant to teach the elements of nursing and modifications may be acquired by the nurse in clinical experience. Most schools of nursing use this method of teaching even when teacher demonstration is the classroom practice.

3 In the event that at some future time the technic needs to be changed, portions of the film may be redone The expense involved is, of course, the detaining factor here. This difficulty has been avoided to some extent by careful analysis before the pictures were filmed.

Conclusions

From experiences thus far, some tentative conclusions have been drawn

1 Students taught by the movie method seem to have a clearer outline in mind of procedure methods They spend less time organizing and beginning laboratory and clinical assignments

2 They apparently make fewer errors, even in finer detailed work. We feel that the students have, with this new teaching method, a definite division between lecture and demonstration—that they see a clear-cut beginning, as it were, to the manual nursing assignment. This probably explains the readiness with which they do "return demonstrations" The change in presentation of material, from lecture to picture projection, in the same class hour holds interest and stimulates attention.

The Right to Hold Staff Standards High

RIGHT OF THE GOVERNING BOARD of a hospital to exercise discretion in designating who may practice in the hospital was accorded additional support recently in a decision handed down by the Circuit Court of Flint, Michigan In that decision, the court dismissed a motion filed by two osteopaths asking a court order allowing them to practice in the Hurley Hospital at Flint, and upheld the hospital board of managers in refusing them use of the hospital

This question has been raised a number of times in Ohio where practitioners other than doctors of medicine have sought membership on hospital staffs, notes the *Ohio State Medical Journal* Ohio statutes are quite clear on the matter, granting hospital authorities or agencies responsible for the operation of hospitals, discretionary powers to make decisions for the best interests and welfare of the institutions

In discussing this question recently, *Modern Hospital* made this editorial comment

Hence, the board of trustees of such an institution (government hospital) may decide what in their judgmnet is the safest practice to follow in the care of the sick and indigent. Even when statutes limit the free action of the boards of government hospitals in respect to the exclusion of cultists, more than one jury has protected the cause of the patient.

The high standing of the hospital staff is the business of the board of trustees It and it only may close the institutional doors to the quack and pretender

This is sound reasoning Hospital standards cannot be maintained if medical staff personnel is of a low grade. Staff standards cannot be maintained if practitioners of all types and sects are granted staff membership Hospitals cannot receive approval and Class A rating from the American Medical Association and American College of Surgeons—important ratings, in our opinion—if they permit others than doctors of medicine to practice in the institution

Newsy Notes

FACED WITH A DEFICIT of approximately $125,000, the Beekman Street Hospital, for the first time since 1929, has been forced to open a campaign to collect funds to maintain its institution which serves lower New York city with emergency service

Howard S Cullman, president of the hospital in his appeal for subscriptions to the business men of this district for aid, pointed out it receives very little money from the United Hospital Fund Out of $2,000,000 raised by this fund, this hospital received only about four-tenths of one per cent

The hospital is run, President Cullman stated, under the stewardship of a board of directors of twenty-six business men with offices in lower Manhattan who actively give their time and experience in helping promote downtown health protection They serve along business lines with audited annual reports and a scrupulous integrity as to medical and professional standards

•

A REVERSAL OF THE DOWNWARD trend in the number of cases of tuberculosis and in the number of deaths from that once widespread disease is stressed in the report of Dr James M Blake, superintendent of Glenridge sanitarium at Schenectady, to the board of managers of that county-run institution

Because the last year produced an increased number of cases and a greater number of deaths, Dr Blake told the board that public health work in relation to tuberculosis must be intensified and warned against acceptance of the growing public attitude that the disease is no longer a serious problem

•

NEW ROCHELLE HOSPITAL reports that, in virtually every respect, 1937 broke all time records so far as the volume of the hospital's work was concerned.

The hospital admitted a total of 4,879 patients last year as against 4,701 in 1936 With a rated capacity of 121 beds and 26 bassinets, the hospital had an average daily census of 157 patients in 1937

This, it is stated in the annual statistical report, is precisely 10 patients daily in excess of capacity It represents an average utilization of 106 8 per cent of capacity

In 1936 the average daily census was 148, nine less than during the last year

Roy E Tilles, associate chairman of the new building fund committee which is seeking a $400,000 fund with which to relieve overcrowding with the addition of a new hospital wing, said that the record for 1937 again underscored the urgency of the need for the new building

"We are inclined to think of emergencies as critical periods of short duration," he said, "but here is an emergency that has existed for more than a year, and no one acquainted with the situation can deny that it is a very critical situation Any large scale accident in the community would bring this home to us in terms I prefer not to describe. If we had the money in hand to begin building tomorrow, it would be at least nine months before the new building would be in operation Let us fervently hope that no abnormal demands have to be made on New Rochelle Hospital before we have the money and have the building which represents this community's need for civic improvement"

DR. S S GOLDWATER, COMMISSIONER of the New York City Department of Hospitals, reports the receipt of an appropriation of $66,000 from the Rockefeller Foundation for the support of research on chronic diseases to be conducted on Welfare Island. The research project to which the Rockefeller money will be applied was inaugurated two years ago and is conducted by a Research staff appointed by the Department of Hospitals and supported in part by the City of New York.

Intensive study of chronic diseases was inspired by a survey of 250 chronic cases in a Department hospital It was found that while little or no progress had been made in relieving these 250 sufferers, the City had actually expended for their care the sum of $600,000, with every prospect that the amount would be doubled or trebled before the patients were disposed of Upon learning these facts, the Department determined to seek the aid of eminent scientists in an effort to study the underlying causes of costly and obstinate chronic diseases in the hope of relieving suffering, shortening the duration of treatment, and raising the health level of the population

OUT OF A TOTAL MEDICAL FRATERNITY of 14,994 in New York City, 6,075 are now attached to the Department of Hospitals—an increase of more than a thousand since 1933

The medical personnel of the Department of Health, 417 in number, forms part of the complete picture

Of the 6,075 physicians in the Department of Hospitals, 4,406 serve without pay This group includes part-time Visiting Physicians and Surgeons of all ranks Included among the 1,569 paid physicians are 706 internes whose pay is only nominal More than four-fifths of the 1,600 clinical assistants serve in outpatient departments

•

DAVID H MCALPIN PYLE, president of the United Hospital Fund, has announced that contributions to the United Hospital Campaign totaled $2,100,989 and other gifts are still being received

The total is almost ten per cent more than last year

Large gifts announced included $2,000 each from Time, Inc, and from the Texas Company, $1,619 from employes of the Metropolitan Life Insurance Company, $1,500 from Church & Dwight Company, Inc, $1,012 from Frank Altschul and $1,000 each from Mrs Charles Suydam Cutting and Harry Payne Bingham and $1,000 additional from Harry Harkness Flagler

The United Hospital Fund helps to provide free hospital care of the sick poor in ninety-two voluntary hospitals of the city The Visiting Nurse Association of Brooklyn also shares in the contributions

DURING THE PAST TEN YEARS a great deal of effort has been expended, chiefly at the initiative of the American College of Surgeons, in the attempt to combat exploitation of the patient by the division of fees A district in Missouri conducted an educational campaign several years ago, frankly telling the people about fee splitting, an effort which was said to be successful

Editor T R. Ponton, of *Hospital Management*, reports that he has received a pamphlet from St. Joseph's Hospital, Milwaukee, in which the same idea is embodied The pamphlet is given the patients and tells exactly how bills should be rendered, and what to expect from accounts which are improperly rendered

If the patient receives a joint account, he is prompted to inquire as to the individual items Surely there can be no more effective means of combating the division of fees

TROY HOSPITAL has a new ambulance valued at $3,650 It was made possible by the proceeds of last spring's La Primavera Fiesta under auspices of the Troy Hospital Ladies' Auxiliary In an emergency it is large enough to accommodate three patients, and is equipped with first aid devices and medicines, as well as an oxygen tank and an assortment of splints, and has a fan for warm weather use

OPERATING EXPENSES EXCEEDED operating income by more than $1,300,000 in the twenty-three Catholic hospitals of the New York Archdiocese last year according to a preliminary report of the Division of Health of New York Catholic Charities, made public by Rt. Rev Msgr John F Brady, director of the Division of Health

The difference between operating revenues and expenditures is made up from donations and benefactions of various kinds including assistance from New York Catholic charities

"Despite the financial difficulties under which they labor," the report states, "Catholic hospitals serving the New York Archdiocese were able in 1937 to give 305,676 days of free care, an increase of 11,000 over 1936, representing a contribution to the health of the community of more than a million and a half dollars in free service

"This of course, would not include nearly 20,000 patients who could pay only a part of the regular rate, or the operating losses from patients paid for by the city at a rate admittedly far below the cost to the hospital The self-sacrificing service of six orders of nursing Sisters who, last year, devoted 210,000 hours to nursing 2,000 indigent patients in their own homes, and contributed approximately $18,000 in cash in addition to their services also should be added, as well as 158,000 visits to our outpatient department of which more than 86,000 were free"

Counsel, Medical Society of the State of New York

Evidence—Privileged Communications

A case which came before the Appellate Division of the Supreme Court of the State of New York a few weeks ago presented a difficult problem of interpretation of the rule governing privileged communications which deals with information acquired by a physician in the treatment of a patient.*

The action was brought by the beneficiary of a life insurance policy in the sum of $15,000 which had been issued by the defendant life insurance company on the life of plaintiff's husband. The defendant as a defense alleged that certain misrepresentations had been made by the assured in his application for the policy in question.

It seems that the deceased had stated that he had never suffered from any illness, disease or injuries and that he had not been treated by any physicians, nor had he consulted with them within five years prior to the time he made his application. Such statements, it was contended, were misrepresentations of fact of such a nature as would invalidate the insurance policy.

The plaintiff undertook to obtain certain testimony upon interrogatories to be submitted to a physician, the Superintendent of a Hospital in Philadelphia. By the said interrogatories the defendant also sought the production of the record of the medical treatment of the deceased while he was a patient at said hospital, and also certain x-ray plates and photos made at the time it was claimed he was a patient there. The plaintiff applied at Special Term to strike out the interrogatories on the grounds that they related to privileged matters under the pertinent provisions of the Civil Practice Act. Defendant contended that it was clear that the interrogatories were pertinent to the issues involved in the action and that they must be allowed, and that the question of competency should be determined upon the trial when the testimony would be sought to be read into evidence.

The Special Term ruled that the interrogatories did not concern privileged matters and denied plaintiff's motion. An appeal was taken to the Appellate Division from the said order.

The Section relied upon by the plaintiff as a basis of her objection to the taking of the interrogatories, in view of the fact that the representatives of the deceased had neither expressly nor by conduct, waived its provisions, is as follows:

> But a physician or surgeon . . . , upon a trial or examination, may disclose any information as to the mental or physical condition of a patient who is deceased, which he acquired in attending such patient professionally, except confidential communications and such facts as would tend to disgrace the memory of the patient, when the provisions of section three hundred and fifty-two have been expressly waived on such trial or examination by the personal representatives of the deceased patient.

The Appellate Division modified the order of the Court at Special Term, ruling that under the circumstances to permit defendant to obtain the information desired upon an examination outside the State would violate the law against the disclosure by physicians of information acquired in attending a patient in a professional capacity. The purpose of the law, according to the Court is,

> to protect those who are required to consult physicians from the disclosure of secrets imparted to them, to protect the relationship of patient and physician and to prevent physicians from disclosing information which might result in humiliation, embarrassment or disgrace to patients.

> The plain purpose of the statute would be frustrated if the information acquired by the physician were revealed, as is here suggested, upon an examination without the State. The disclosure of secrets imparted to a physician by a patient is not permitted by our statute upon an examination before a commissioner or a referee any more than it is upon the trial of the action or proceeding, unless there be a waiver made in open court on the trial of the action or proceeding. In a word, the statute contemplates that, in the absence of the required waiver, the confidential information be shut off at the source.

If plaintiff upon the trial should waive the privilege which she had theretofore consistently asserted, the inability of defendant to obtain testimony from another State to establish its defense might, in certain circumstances, furnish sufficient grounds to warrant a reasonable adjournment or perhaps a mistrial on the ground of surprise. However, that question is not now before us.

Under the authorities it is competent for defendant to show "such ordinary incidents and facts as are plain to the observation of any one without expert or professional knowledge." In-

Across the Desk

"Old Dame Trot," Magistra Medicinae

"Old Dame Trot" was the rather derisive title given her by some unfriendly writers, but in her own day she was known as "Magistra Medicinae," and her medical writings were highly prized and widely used for 500 years after her death She is the most prominent figure, in fact, in a new "History of Women in Medicine, From the Earliest Times to the Beginning of the Nineteenth Century,"* where she is given no less than forty pages Those who do not recognize her under her nickname may recall her under one of these, variously used by her followers

Trotula	Trocula	tt'
Trotta	Tuenda	Truta
Trocta	Trottus	Trutella
Tortolo	trott'	Trorula

She just missed being an M.D by a bare hundred years, it seems, because she lived in the eleventh century, and the title "doctor," meaning physician, was first used legally at Salerno in the twelfth However, the title Magistra Medicinae is not bad, and a reading of her forty pages would indicate that she was entitled to any medical degree that was going at that time.

A Bright Star in Salerno's Crown

Perhaps everyone may not know that Salerno, along the coast southeast of Naples, was the seat of the great medical school of that era Aquinas said that there were four famous colleges in Europe Paris for science, Salerno for medicine, Bologna for law, and Lyons for philosophy Bologna's fame has descended to sausage, and Salerno is now only a pleasant seaside town. In the eleventh century, however, students flocked to Salerno from all parts of the civilized world, to study medicine, and one of the brightest stars in Salerno's crown was the celebrated Magistra, Trotula Manuscripts of her writings dating back to the thirteenth and fourteenth centuries are still existent in European libraries, and the author of this encyclopedic and scholarly "History of Women in Medicine," Kate Campbell Hurd-Mead, M.D, spent years in unremitting research among the musty tomes, digging out the amazing array of facts in her book. She is now writing a companion volume, bringing the story of women in medicine down from 1800 to the present day

The teaching at Salerno was based on the works of Hippocrates, Aristotle, and Galen, and the school was sometimes known as the *Collegium Hippocraticum* and the city as the *Civitas Hippocratica* Of course Hippocrates was a pagan, but the poor man was hardly to blame, for he died in 357 B C, and the church authorities, strict in other things, sanctioned many pagan books on medicine because they had proved to be good.

Famous for Hundreds of Years

Trotula wrote principally on gynecology and the diseases of women Much of her material came of course from earlier writers, and we naturally could not expect her to rise far above the general level of the medical knowledge of her time, but "what she did do," says Dr Hurd-Mead, "was to teach and write so practical a treatise of gynecology and midwifery that for hundreds of years it was copied and used, and referred to as the great authority and textbook for women doctors and midwives in handling labor cases"

Medicine of that day had a good deal of mumery and hocus-pocus, but Trotula's writings are singularly free of that sort of thing The dried moss from the skull of a man who had been hanged was not in her *materia medica,* notes Dr Hurd-Mead, nor was "tongue of newt or toe of frog" in her list of remedies It is true that some of the later copies of her manuscripts state that she advised wearing certain crystals, or the spongy bone from the head of an ass, to prevent abortion, but it is pointed out that the very fact that these items ap-

*A History of Women in Medicine, from the earliest times to the beginning of the nineteenth century By Kate Campbell Hurd-Mead M D 569 pages, illustrated. Haddam, Conn. the Haddam Press Cloth, $6

terrogatories designed to elicit whether the deceased was treated professionally, the names of the physicians who treated him, the date of his entry in the hospital, and the date of his discharge, are proper However, the questions which call for the production of hospital records for the obvious purpose of establishing the character of the disease or ailment for which the insured was being treated at the hospital, should have been stricken out. They are inadmissible because they are privileged communications in the same sense as is the testimony of the physician himself who made the diagnosis

Fistula Following Delivery

A woman twenty-seven years of age, consulted a physician who specialized in obstetrics and gynecology with respect to her pregnant condition, and engaged him to deliver her He saw her twice a month during the last five months of pregnancy and in due course the doctor directed her when she went into labor to enter a hospital for confinement He found it necessary in the course of the delivery to use forceps and to perform an episiotomy The patient gave birth to a normal living child and after the delivery the doctor sutured with chromic catgut, the laceration The patient remained in the hospital twelve days following the birth of her child and at the end of that time was discharged in good condition No complications developed and on discharge the episiotomy had healed and there were no indications of any abscesses or any other untoward developments The doctor advised the patient to return to him at regular intervals for examination and to get in touch with him if anything went wrong The patient, however, never communicated with the doctor subsequent to leaving the hospital and several months later instituted a malpractice action against him

Plaintiff claimed in her complaint and bill of particulars that following delivery she complained continually to the defendant of severe pains in the region where he had placed sutures and that she had requested the defendant to examine the said region and that the defendant refused to do so. She claimed that in the absence of such examination an infection set in and made great progress before any medical care was received by her She charged that through defendant's negligence she suffered from certain abscesses which developed into a deep-seated, internal fistula through her perineum, necessitating an operation

Investigation of the case shows that some months after the patient had been discharged from the hospital she had gone to another doctor who had found that she was at that time suffering from a fistula just below the entrance to the vagina and he had operated upon her, performing a plastic operation to eliminate the condition The doctor who performed the said operation was of the opinion that the condition found by him was not in any respect caused by any negligence on the part of the defendant as it was claimed by the plaintiff

After instituting the action the plaintiff failed to place the same on the calendar for trial and in due course a motion was made on behalf of the defendant to dismiss the action for lack of prosecution When such motion was made the plaintiff's attorney voluntarily consented to discontinuing the action, thereby admitting he was unable to sustain his cause of action against the defendant

NEW YORK LEADS IN BIRTH-CONTROL CLINICS

The number of medically supervised birth-control clinics in this country rose to a new high last year, indicating a larger public concern with birth-control problems, it was reported at the annual meeting of the American Birth Control League at the Hotel Biltmore, New York City More than 200 delegates from twenty States attended the conference.

There are 374 birth-control clinics in the United States, Hawaii and Puerto Rico, it was announced This represents an increase of eighty-seven last year New York State, with fifty-nine clinics, leads all other States in the number of centers for birth-control information, it was said

More than forty birth-control clinics are situated in city and county health departments, while last year only ten such clinics were in operation, it was pointed out. In addition, health departments of at least three States have programs of contraceptive service. These increases in the number of governmental agencies were praised as recognition of birth control "as a public health measure which conserves strength, health and lives of mothers"

Mrs George C Barclay, president of the New York State Birth Control Federation, said her group was planning a program for this year to make medical birth-control information available to mothers living in rural areas as well as those in urban centers

Mentality and Homosexuality By Samuel Kahn, B S Octavo of 249 pages, Boston, Meador Publishing Company, 1937 Cloth, $3 00

REVIEWED

Post-Graduate Surgery Edited by Rodney Maingot. F R C S Volume III Quarto Page 3575 to 5584, illustrated. New York, D Appleton-Century Company, 1937 Cloth, $45 00 set of three volumes

In this third volume, a large list of subjects is considered Individual parts by different specialists are devoted to medical aspects of surgery, hernia, plastic, obstetric and cardio-vascular surgery, lymphatic system, orthopedics, eye, ear, nose, endoscopic methods in surgery, malignant tumors of the pharynx and larynx, tonsils and adenoids and retropharyngeal abscess, tongue, mouth and lips, esophagus and diaphragm, mandible, fractures of the mandible, teeth, venereal disease, physical medicine, deep x-ray therapy, some aspects of general surgery, and some neurological and psychiatric aspects of surgery The volume is a large one of 2008 pages, including a list of contributors, a table of contents and a comprehensive index. As the title of the volume implies, the work is intended for advanced students of surgery Technical operative methods are fully studied Symptoms, pathology and diagnosis are, however, not sacrificed to technic. Numerous diagrams, sketches and photographs add greatly to the value of the text which is concise and practical The illustrations are well chosen and of superior quality In addition to practical considerations, a chapter at the end is devoted to neurological and psychiatric aspects of surgery The volume is equal to the quality of the preceding ones, and should be of value in acquainting the advanced student of surgery with methods found useful and recommended by a long list of competent British surgeons

EMIL GOETSCH

pear in the later copies of her works, and not in her earlier, stamp them as interpolations of copyists

Bedside Medicine a la Trotula

The Magistra cultivated the *tactus eruditus*, as well as the other senses, and studied the pulse. With these only, we are told, she distinguished the symptoms of malaria from those of typhoid and the eruptive fevers, calculating the height of the fever and the date of convalescence without any of the instruments of precision which seem to us so essential She taught her pupils to be most observant. As she wrote

"When you reach the patient, ask where his pain is, then feel his pulse, touch his skin to see if he has fever, ask if he has had a chill, and when the pain began, and if it was worse at night, watch his facial expression, test the softness of his abdomen, ask if he passes urine freely, look carefully at the urine, examine his body for sensitive spots, and if you find nothing, ask what other doctors he has consulted and what was their diagnosis, ask if he ever had a similar attack, and when Then, having found the cause of his trouble, it will be easy to determine the treatment."

Right Up to the Minute

She was nothing if not up to date, either She had lotions for the complexion, remedies for pimples, and for superfluous hair She gave prescriptions for hair dyes, black, yellow and red, coloring preparations for the cheeks and lips, lotions to banish odors from the armpits, and gargles for sweetening the breath No wonder she was popular

She tells of a wonderful ointment to rub on the face, *"et miro modo rubescit"* She tells how to prepare face paints, and says that Saracen women like green best. To soften hands, she used asphodel mixed with white of egg She tells how to turn a blonde into a brunette, how to curl the hair, how to make hair grow rapidly (by the use of mallows soaked in wine mixed with yolk of egg and herbs)

These are of course the lighter asides Her writings in the main are on the serious problems of women's ills, particularly childbearing, and how to treat them. Her chapter on the signs of pregnancy gives us an insight into the superstitions of her era. She says, "if the left breast is larger than the right, the baby will be a girl" (which she got from Hippocrates) To determine sex, she gives another sign "Place a few drops of the mother's blood, or of the milk of her right breast, in a glass of water—if they sink, the baby will be a boy" Constantine quoted this with approval, notes Dr Hurd-Mead, and even today, she adds, "we find such little experiments a conventional part of the obstetric superstitions of country people."

Medicine's Poetical Era

Medical works were often put into verse in those days of knights, castles, high romance, and ladies fair, but not for any highfalutin' reason It was simply because they were easier to remember When this engaging custom died out is not stated, but it would stump any poet nowadays to find rhymes for some of the terms in medical parlance Perhaps a few headaches from trying to rhyme jawbreakers ended medicine's Poetical Era. But Trotula's treatises did not escape the rhymesters, and they turned up in verse in all the languages of the period, and with all sorts of additions and emendations One of the additions contained the famous advice which was put into English "Use three physicians still, first Doctor Quiet, next Doctor Merryman, then Doctor Dyet."

Dr Hurd-Mead gives us a rhymed passage from Trotula on the care of the teeth The belief of those days was that as "dirt" in the blood causes disease by settling in certain parts of the body, so "wormes" in the teeth cause pain. She wrote

"If in your teeth you hap to be tormented,
By mean some little wormes therein do breed,
Which pain (if heed be ta'en) may be prevented,
By keeping cleane your teeth, when as you feede,
Burne Francom-sence (a gum not evil sented)
Put hen-bane unto this, and Onyon-seed,
And with a Tunnell to the tooth that's hollow,
Convey the smoke thereof, and ease shall follow"

In the pneumococcus pneumonias the types recognized are 1 to 32 and the unclassified. In adults, types 1, 3, 2, 5, 8, 7 and 4 are most frequently encountered in the order named, these giving rise to about seventy per cent of the pneumococcic pneumonias, and for all except 3, is useful specific therapeutic serum Type 1 made up twenty-five per cent and the other six types together, forty-five per cent of the cases The other types in order of frequency are 14, 9, 18, 6, and 19

The laboratory examination is described in detail with many illustrations The swollen capsule test (Neufeld) is the one generally used for typing The value of lung suction is said to be established when there is doubt concerning the responsible organism

It is recommended that every patient suspected of pneumonia should have a blood culture when first seen The technique is described. The chapters on oxygen therapy with tents and chambers are complete, with preferable types of oxygen flow gauges described and illustrated

Probably the most interesting part of the book is its detailed description of serum therapy with many clarifying illustrations and tables The author has for some years been one of the leading exponents of this method of treatment which has gradually grown to dominate the field.

WILLIAM E MCCOLLOM

Practical Talks on Kidney Disease. By Edward Weiss, M D Octavo of 176 pages, illustrated Springfield, Charles C. Thomas, 1937 Cloth, $3 00

The author states that he aims to present a concise survey of kidney disease and hypertension for the physician who practises general medicine, and this has been well accomplished Historical features and nomenclature mainly occupy the introduction Disturbances of renal function, various tests, and signs and symptoms are well described. The chapter on retinal lesions is particularly good, and is well-illustrated.

Modern ideas as to diet and general management are adequately presented, and some foolish restrictions still favored by some practitioners, properly condemned It is an excellent book, and presents in an easily readable form all the practical aspects of kidney disease.

WILLIAM E MCCOLLOM

Obstetric and Gynecologic Nursing By Frederick H Falls, M D and Jane R McLaughlin, R N Octavo of 492 pages, illustrated St Louis, C V Mosby Company, 1937 Cloth, $3 00

This volume, from teachers at the University of Illinois, combines the subjects of obstetrics and gynecology in one textbook for nurses, an innovation which is to be highly commended. This is the way these subjects should be taught to nurses

The text is not simple, as the book is intended for nursing students who have had college preparation Any good school of nursing, however, will find it valuable. Nursing instructors will do well to read it—all the obstetrics and gynecology they ever will have to know will be found there

The visual lessons of fine line drawings, and the well prepared outlines of nursing procedures add immeasurably to the value of a textbook which is the first of its kind

CHARLES A GORDON

International Clinics A Quarterly of Illustrated Clinical Lectures and Especially Prepared Original Articles on Treatment, Medicine, Surgery, Neurology, etc. Edited by Louis Hamman, M D Volume 3, 47th Series Octavo of 328 pages, illustrated Philadelphia, J B Lippincott Co, 1937 Cloth, $3 00

This issue of the *International Clinics* surpasses even the very high standard attained by its predecessors of recent years There are more than twenty practical articles, some of which incorporate original work of a high order A series of nine medical clinics from the Johns Hopkins Hospital deserve special mention The survey of peripheral vascular diseases by Hermann and that of hyperproteinemia by Jeghers and Selesnick are of conspicuous excellence. The volume may be highly recommended

MILTON PLOTZ

Condition Satisfactory A Physician's Report on His Own Illness By Dr Sandor Puder Octavo of 201 pages New York, Alfred A. Knopf, 1937 Cloth, $2 00

This book is an account of the experiences of a Budapest physician who underwent three operations before he was finally rid of a gangrenous appendix with a localized peritonitis—two laparotomies for drainage of localized appendiceal abscesses, and a third for removal of the appendix and repair of a ventral hernia He experienced three types of anesthesia, general, local and spinal, in the order named. His invalidism lasted two years He seems reasonably justified, therefore, in telling his story In his preface, the author says, "The following case-history endeavors by means of a detailed account of physical and psychological happenings to present the experiences of a physician throughout the course of his illness"

There is a foreword by Frigyes Karinthy, to whom the author had submitted the script

Diseases of the Nervous System in Infancy, Childhood and Adolescence. By Frank R. Ford, M D Quarto of 953 pages, illustrated Springfield, Charles C. Thomas, 1937 Cloth, $8.50

Dr Ford, who is associate professor of neurology at Johns Hopkins University, has presented to the medical profession in this excellent work a comprehensive and exhaustive treatise in a field which lies on the borderland between pediatrics and neurology, a field which has been little exploited in the past. There is no doubt that the neurology of childhood is still in an early stage of development as contrasted with that of adult life, and as Dr Ford states in his preface, even the common nervous disorders of this period are to a great extent obscure It has been his endeavor throughout the book to develop a classification based primarily on etiology, with the emphasis placed upon clinical features rather than upon the usual anatomical classification. He stresses the essential clinical features of each condition discussed, with a brief outline of the pathology, anatomy, diagnosis, prognosis and established principles of treatment.

The work is richly illustrated with diagrams and photographs, it is excellently indexed, clearly printed, and has an extensive bibliography at the end of each section, referring preferably to works in the English tongue It is a book that should be in the library of every physician who comes in frequent contact with the neurological diseases of childhood

FREDERIC C EASTMAN

Operative Obstetrics A Guide to the Difficulties and Complications of Obstetric Practice By J M Munro Kerr, M D Fourth edition Quarto of 847 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $12 00

This is a revision of Kerr's book "Operative Midwifery" Very clearly written and extraordinarily well-illustrated, it is a credit to the old master, whose interest in the reduction of maternal mortality has made him a better teacher than ever

Kerr describes very clearly manual rotation of the occiput in the management of occipital posterior positions, and points out that it was extensively employed by Smellie who was, he thinks, the greatest practical obstetrician any country has ever produced Kerr's transverse lower segment cesarean is increasing in favor in this country and his, yet strange to say, British obstetricians have by no means adopted any lower segment operation He has widened his indications for cesarean in placenta previa, and maintains that if a large series of cases is taken the maternal mortality will be definitely lower for cesarean than for any other method, except simple rupture of membranes in lateral previa. In abruptio placentae he is strongly in favor of the conservative treatment so long practiced in Brooklyn.

The book is new, up to the minute, and singularly free from the numerous pictures of complicated deliveries in Sims position, so long thought necessary by our English cousins The book is well-worth reading, and no specialist should miss it.

CHARLES A GORDON

Injuries and Diseases of the Hip Surgery and Conservative Treatment. By Fred H Albee, M D Assisted by Robert L Preston, M D Octavo of 298 pages, illustrated. New York, Paul B Hoeber, Inc, 1937 Cloth, $5 50

In view of recent interest shown by surgeons and orthopedists alike in fractures of the neck of the femur, this book comes at an opportune time. The author is well known, and is considered a leader in this field.

Albee states that he has good results in 91 7 per cent of his cases of fresh fractures of the neck of the femur He attributes his good results mainly to the fact that, in addition to securing good reduction and long immobilization, he uses an autogenous bone peg across the fracture line. This bone peg, Albee feels, is the missing link to a baffling problem The bone peg furnishes an osteogenetic callus, forming influence, serving at the same time as a vascular conducting scaffold The author discusses other approved methods employed by surgeons generally, and comments on their good or bad features.

Inasmuch as this book is essentially a monograph on diseases of the hip, the author discusses other conditions, such as, congenital dislocation, tuberculosis, synovitis and arthritis, arthroplasty, coxa vara, Perthes diseases, etc. The book is written in simple style and is well-illustrated. Operative technic is stressed and described in minute detail

CARMELO C VITALE

The Management of the Pneumonias For Physicians and Medical Students. By Jesse G M Bullowa, M D Octavo of 508 pages, illustrated New York, Oxford University Press, 1937 Cloth, $8 50

This book is based largely upon studies carried on in the Littauer Pneumonia Research Laboratory and the wards of the Harlem Hospital The author's large experience in pneumonia is recorded, with emphasis on the various factors concerned with serum treatment.

In the pneumococcus pneumonias the types recognized are 1 to 32 and the unclassified In adults, types 1, 3, 2, 5, 8, 7 and 4 are most frequently encountered in the order named, these giving rise to about seventy per cent of the pneumococcic pneumonias, and for all except 3, is useful specific therapeutic serum Type 1 made up twenty-five per cent and the other six types together, forty-five per cent of the cases The other types in order of frequency are 14, 9, 18, 6, and 19

The laboratory examination is described in detail with many illustrations The swollen capsule test (Neufeld) is the one generally used for typing The value of lung suction is said to be established when there is doubt concerning the responsible organism.

It is recommended that every patient suspected of pneumonia should have a blood culture when first seen The technique is described. The chapters on oxygen therapy with tents and chambers are complete, with preferable types of oxygen flow gauges described and illustrated

Probably the most interesting part of the book is its detailed description of serum therapy with many clarifying illustrations and tables The author has for some years been one of the leading exponents of this method of treatment which has gradually grown to dominate the field

MILTON PLOTZ

Condition Satisfactory A Physician's Report on His Own Illness By Dr Sandor Puder Octavo of 201 pages New York, Alfred A Knopf, 1937 Cloth, $2 00

This book is an account of the experiences of a Budapest physician who underwent three operations before he was finally rid of a gangrenous appendix with a localized peritonitis—two laparotomies for drainage of localized appendiceal abscesses, and a third for removal of the appendix and repair of a ventral hernia He experienced three types of anesthesia, general, local and spinal, in the order named His invalidism lasted two years He seems reasonably justified, therefore, in telling his story In his preface, the author says, "The following case-history endeavors by means of a detailed account of physical and psychological happenings to present the experiences of a physician throughout the course of his illness"

There is a foreword by Frigyes Karinthy, to whom the author had submitted the script

for suggestions and corrections, and who read the notes with evident enjoyment and interest. The account, then, is a recital of the experiences with the many and various pre- and postoperative incidents and accidents of such a sickness, as seen and felt by a physician This involves a more scrutinizing survey of diagnoses and complications than is generally given by a layman It is quite evident, however, that he did not enjoy the pleasantries of enemata and catheterizations any more than a layman would, and was just as bored by indifferent attentions and trying visitors The simple appendix operation seems to have lost its terrors to the public, but the story of and by Dr Puder will put the surgery of the complicated case back in the category of critical diseases, where it really belongs

J RAPHAEL

Evans' Recent Advances in Physiology Revised by W H Newton, M D Fifth edition Octavo of 500 pages, illustrated Philadelphia, P Blakiston's Son & Co, Inc 1936 Cloth, $5 00

Once more this valuable work on physiological literature appears With the massive output of research Dr Newton's contribution is of peculiar advantage The consideration of the current status of the coronary circulation (by Dr Evans) and the review of nerve and kidney physiology are especially good.

GEORGE B RAY

Collected Papers of the Mayo Clinic and the Mayo Foundation. Edited by Richard M Hewitt, M D, Lloyd G Potter and A B Nevling, M D Volume XXVIII Octavo of 1331 pages, illustrated Philadelphia, W B Saunders Company, 1937 Cloth, $12 00

This volume comprises papers from the Mayo Clinic and Foundation published during 1936 Some of the papers appear in full, others are abstracts or appear by title. The large list of contributors and the wide range of articles treat of conditions pertaining to diseases of the alimentary tract, genitourinary organs, ductless glands, blood and circulatory organs, skin and syphilis, head trunk and extremities, chest, brain, spinal cord and nerves, radiology and physical medicine, anesthesia technic, and a final chapter of miscellaneous subjects The papers represent studies of individual contributors, and contain an abundance of well chosen illustrations, charts and statistical tables The aim in selecting material for this volume was to assemble a work which would be useful primarily to the general practitioner, diagnostician and general surgeon There is much material which should be helpful to the student and practitioner in the general field of medicine.

EMIL GOETSCH

Emotional Adjustment in Marriage. By Le Mon Clark, M D Octavo of 261 pages. St. Louis, The C. V Mosby Company, 1937 Cloth, $3 00

In this volume the author considers the sexual side of life in its relation to the individual, the family, and society The method followed is to give the parent-group the necessary information as a basis for a rational orientation of their own lives

When the parents understand their own sex lives, the author believes that sex education of children will naturally follow

This book is written for the normal individual, and discussion of abnormal manifestation has been almost entirely avoided By a perusal of these pages the reader will gain much valuable information in regard to sex and marriage.

WILLIAM SIDNEY SMITH

Manual of the Diseases of the Eye. For Students and General Practitioners By Charles H May, M D Fifteenth edition, revised Duodecimo of 498 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $4 00

Once again this remarkable book has been brought up to date in this its fifteenth edition, and continues to deserve the popularity it enjoys in many countries besides our own. As stated in the preface two chapters have been rewritten, and the illustrations have been overhauled and replaced where needed.

Among new material may be mentioned brief notices of dinitrophenol cataract, gonioscopy, pontocaine, recumbent spectacles, polaroid glass, etc., all of which have occupied places in ophthalmological literature since the previous edition was printed Especially the colored figures, in number and quality, present a fairly complete and accurate atlas of diseases of the eye which is as valuable as that in some of the more imposing works

No book has as yet appeared which can replace this as a textbook on the eye for students and general practitioners

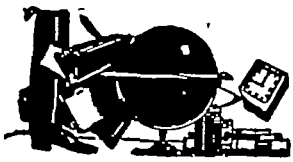
TECHNICAL NOTES FROM ADVERTISERS

Montecatini a $25,000,000 Health Spa

Printers and compositors are sometimes prone to be lighthearted about figures In the February 15th issue of the State Journal in the line of the Montecatini Spa advertisement which originally read Italy's famed $25 000 000 Health Center—20 minutes from Florence,' the last three ciphers of the twenty five million figure were omitted through typographical error

Any reader would admit that was carrying reduction in government costs entirely too far

As a matter of fact the amount that the Italian Kingdom has expended during the past ten years in making Montecatini one of the world's greatest spas would greatly exceed twenty five million dollars if it were translated into American labor costs as well as American money



Montecatini is one of the world s most extensive and oldest known spas for the treatment of stomach liver and intestinal diseases and disturbances of metabolism. Its history probably dates all the way back to the days of the Roman Emperors and since early in the 14th Century it has been very famous as a spa. That it is one of the world's largest is indicated by the fact that the combined flow from its various thermal springs reaches the huge figure of 540 000 000 gallons yearly

Modern scientific research has been carried on for years by the government and by the universities of Rome and Pisa and extensive clinical tests are now carried on at Montecatini every season. Over 240 000 patients went to Montecatini for the cure last season, the number of Americans being double the previous year's American attendance.

Education

Education means the symmetrical development of soul, mind, and body Neglect of any one of these makes an unfinished man The most dangerous men in society are educated men whose moral character is deformed, either by nature, which is very rare, or by neglect of early training

Another aim is to give the mind power rather than attempt merely to store it with information. The power to know is more important than knowing Recitations are but daily affairs The ability to think is for a lifetime, and its influence upon others is for eternity

Again, schools aim to co-operate with parents, just as the patient co-operates with the doctor in the restoration of health

Students are admitted only after personal interviews, so that undesirable elements are kept out, and the student's associations are of a high type.

INSTITUTIONS SPECIALIZING IN TREATMENTS

The Nursing Home

As the last step in the treatment of many patients started on the road to recovery by their physician, the nursing home is conducive to more rapid and complete recovery

In the selection of such an institution, The Albert Homestead recommends itself with many exceptionally fine features

Three acres of lawns, shrubbery, trees, and vegetable gardens, surround the stately, brick homestead overlooking the Hudson at Ossining Sunny living room and bedrooms, enclosed solarium, a large open terrace and spacious out-door porch, stimulate a feeling of fine living, comfort and restfulness

Under the personal supervision of Miss Anna Albert, a registered nurse with many years of experience in varied nursing fields, including institutional management and public health, the Homestead provides the finest nursing care and individual attention to dietary or other prescribed requirements

Reasonable rates and accessibility are additional features, but do not complete all the advantages of the Homestead.

THE ALBERT HOMESTEAD

A
HIGH
CLASS
PRIVATE
SANITARIUM

recognized for 50 years by the medical profession

Restricted to a limited number of nervous and mental cases—not violent, dangerous, noisy, or otherwise objectionable—with special facilities for the care of aged and chronic cases

Environment and administration are such as affords the most beneficial atmosphere Contact with others is controlled through caring for the patients in suites (practically all with private baths) A fully qualified medical and nursing staff, physiotherapy hydrotherapy, massage, and occupational therapy in addition to attractive and modern buildings make "Falkirk in the Ramapos" one of America's most complete sanitaria.

Convenience and accessibility in nearby accommodations and transportation for guests makes the location ideal The sanitarium and its program of treatment are so arranged that patients have greater comfort and service than found elsewhere

RESPIRATORY DISORDERS

treated with modern inhalation equipment

Modern equipment of proven efficiency, used at the Lakewood Inhalatorium, provides both wet inhalation for various mineral waters and salts, and dry nebulizing for various medications, useful in treating disorders of the respiratory tract.

This equipment is complete and includes (as illustrated here) (1) individual inhalation apparatus, (2) the same being used for combined treatment of mineral waters and medication, (3) group inhalation in a room where vapor and aerified medication is developed, and (4) pneumotherapy apparatus for chronic infections of the respiratory tract.

The institution, approved by the Medical Society of New Jersey, accepts patients only upon written recommendation of their physicians

We invite all physicians to inspect the Inhalatorium, and will send upon request a copy of *"Inhalation and Pneumatic Treatments"* describing this form of therapy in full

Travel and Resorts

"Little, but "

It is one of the smallest railroads in the world, but because of circumstances, it is relatively more important to the community it serves than many gigantic transcontinental systems It boasts no Twentieth Century Limited, no Flying Scotsman, no Rheingold Express, but even world-travellers who have tried them all will experience a new and delightful thrill when they ride the quaint, yet modern little Railway in Bermuda.

The Railway, the only permitted modern conveyance in the Isles of Rest, has this distinction only because it has been kept decorative and unobtrusive. So retiring is it, that many visitors fail to notice it and miss the experience of traveling on it because they don't expect to find such transportation where even the motor car is taboo

But, so quietly does the Railway go about its business, on its twenty-two mile run skirting the scenic North Shore at one place, going through coral cliffs at another, then on a trestle over an inlet of pale green water, and at times close to cedar-lined carriage roads, that it has become one of the features of Bermuda for all visitors whether on a short cruise excursion or a more extended visit.

For the visitor of only a few hours, it offers a complete tour of the islands in a short time and quick transportation to many points of interest. For the visitor with time on his hands, it is a pleasant diversion and a regular source of transportation for longer distances than he might care to travel by carriage or bicycle.

* * *

Air Records

During the year 1937 American Airlines, Inc, carried 300,571 revenue passengers a total distance of 123,074,318 miles Reduced to a single person's efforts, this is equivalent to that person traveling 4,942 times around the world. Flying continuously day and night at an average speed of 180 miles per hour, it would take him 78 years to complete the flight. Total airplane miles flown with passengers amounted

to 15,585,863 for the year. According to figures released, the line had an average of 11.5 ships in flight day and night throughout the entire year. Each plane carried an average revenue load of 7.9 passengers plus crew and approximately 500 pounds of express, air mail and baggage. The 15,585,863 airplane miles flown is equivalent to one ship flying around the world at the equator 625 times. Flying at 180 miles per hour, one airplane would have to fly continuously for almost 10 years to complete this amount of flying.

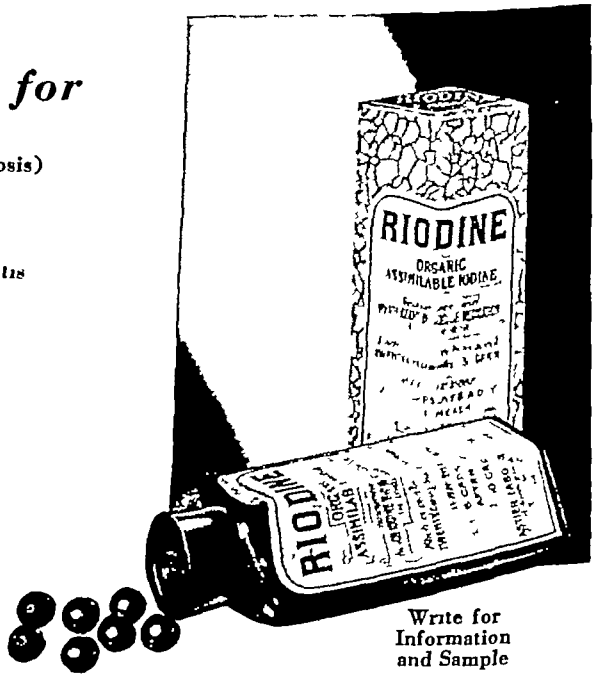
Peculiarly Adapted to Prolonged Iodine Medication . .

RIODINE

(Astier)



How to secure satisfactory results in prolonged iodine medication, without iodism, is often a problem Barring idiosyncrasies, the severity of the symptoms of iodism is directly proportional to the amount of iodine retained in the blood, and this in turn depends upon the quantity administered Hence it is desirable that the iodine content of the blood and the dose administered be kept as low as is compatible with therapeutic effect *This may be accomplished with RIODINE*

In Riodine, which is an iodine addition product of castor oil, containing 17% of iodine, the iodine is held in such a form as to pass through the stomach unchanged as iodized fat and be absorbed from the intestines Consequently, it is held in the body's cells in lipoid-soluble form The rapid elimination of iodine from the kidney that takes place with potassium iodide is avoided Thus the necessity of frequent and large doses is obviated

Riodine may be applied to the treatment of a great variety of conditions It is of particular advantage in cases where the continuous action of iodine is desired

Use RIODINE *for*

Cardiorenal Disturbances
Hypertension (Arteriosclerosis)
Bronchial Asthma
Chronic Bronchitis
Pulmonary Emphysema
Chronic Rheumatoid Arthritis

BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy

KALAK *is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency*

KALAK WATER COMPANY OF NEW YORK, INC., 6 CHURCH STREET, NEW YORK CITY

Quick and Long Lasting RELIEF in COLDS

NEO-SYNEPHRIN
HYDROCHLORIDE

(laevo-alpha hydroxy beta methyl-amino-3-hydroxy ethylbenzene hydrochloride)

● The decongestive action of Neo-Synephrin is not only prompt but also of long duration Half a dropperful of Neo-Synephrin Hydrochloride Emulsion or ¼% Solution will rapidly bring about vasoconstriction in the nasal mucosa, and the relief thus obtained will often continue for several hours

Further, Neo-Synephrin has the advantage of being less toxic in therapeutic dosage than epinephrine or ephedrine and when used as recommended it does not usually produce "nervousness" or insomnia

Neo-Synephrin does not sting It is easy to apply and the Emulsion spreads rapidly, thereby quickly relieving the congestion

Dosage Forms

EMULSION
¼% (1-oz. bottle with dropper)

SOLUTION
¼% for dropper or spray
1% for resistant cases (1-oz bottle)

JELLY
½% (in collapsible tubes with applicator)

To increase the blood pressure in hypotension due to surgery, trauma or anesthesia, particularly spinal: Neo Synephrin Hydrochloride 1% Solution; available in rubber-capped vials containing 15 cc.

HOW DO YOU PRESCRIBE *Calcium?*

OBVIOUSLY you wouldn't ask a patient to eat 17 pounds of potatoes or 7 loaves of white bread daily Yet it has been estimated[1] that these respective amounts would be needed to supply the daily calcium requirement

Of course, from a practical point of view, such a diet is out of the question Furthermore, there is no assurance that it would provide Vitamin D—a factor essential for the utilization of calcium and phosphorus

For conditions in which calcium is indicated, many physicians prescribe a dietary supplement, such as Dicalcium Phosphate Compound with Viosterol Squibb This product not only supplies the necessary calcium and phosphorus, but also ample Vitamin D to assure their proper absorption and utilization.

Dicalcium Phosphate Compound with Viosterol Squibb is supplied in tablet and capsule form One pleasantly flavored tablet—or two capsules—contains 2 6 gr calcium, 1 6 gr phosphorus, and 660 units of Vitamin D (U S P XI)

The capsules are useful as a change from tablets, or during pregnancy when nausea tends to restrict normal food intake The tablets are available in boxes of 51 and 250, capsules in bottles of 100 and 1000

MALTINE WITH COD LIVER OIL

. . . proved in practice

THE experience of two generations of physicians who have prescribed MALTINE WITH COD LIVER OIL successfully is ample evidence of the value of this 63-year-old preparation Further evidence is the result of biological experiments which have proved that the vitamin-A efficiency of cod liver oil is doubly enhanced when it is emulsified with Maltine These facts, plus the advantage that MALTINE WITH COD LIVER OIL has none of the unpleasant taste of vitamin bearing oils, make the preparation desirable for the prescription of vitamins A and D The patient receives as well the valuable components of Maltine itself

MALTINE WITH COD LIVER OIL and IRON IODIDE offers the same advantages in cases where iron iodide is indicated It contains two grains of freshly prepared iron iodide per fluid ounce The Maltine Company, 60 Hudson Street, New York City

UMBILICAL AND INCISIONAL HERNIA SUPPORTS

The use of incisional and umbilical hernia supports preliminary to operation is stated by a writer* in the current medical literature as follows —" in cases in which the hernia has protruded from the abdomen for some time, if the abdomen can be so compressed by artificial means that the hernia is replaced and the patient can readjust himself to the normal environment of the intestine in the abdomen, there is less likelihood of postoperative distension and vomiting"

Patient with incisional hernia

Camp incisional hernia supports have proved to be exceptionally efficient when prescribed as a preliminary to operation, for inoperable cases or for those patients who will not consent to an operation

The lower adjustment strap with the buckle and lacing device anchors the lower sections of the support firmly about the pelvis — thus laying a foundation for the upright sections With such a firm foundation the upper adjustment strap, coming above the lumbar region, gives added support to the abdomen

Same patient after application of suppo

Free chart to explain deafness

● Enlarged and interestingly colored, this diagram of the ear will help you explain both bone and air conduction to your patients Sent free upon request, it contains no advertising—helps you describe the new Coronation Acousticon, a crowning achievement in the hearing aid field The Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds It is more than ever adaptable to individual requirements

● SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE for custom fittings on the Aurogauge and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy No charge or obligation for fittings, at the Institute, your office or your patients' homes

● HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS but are reluctant to do so because of psychological factors? We want to send them literature especially prepared to help you break down their objections and make them follow your recommendations Won't you give us their names and addresses? Of course, your name will not be mentioned—unless you say so

LAYING THE CORNERSTONE FOR A QUART OF THE WORLD'S FINEST MILK

Fine Forage Makes Finer Milk—so Walker-Gordon *times* its harvesting carefully, gathering in the forage grown for Walker Gordon cows right at the moment it is at peak nutritional value Thus, Walker-Gordon cows get only the most nutritious forage at all times—one reason why Walker-Gordon Certified Milk is always so much richer, for instance, in vitamins and minerals

What The World's Largest Silos Do for a Quart of Milk—these Walker-Gordon silos at Plainsboro, N J, tall as five-story houses, store scientifically prepared ensilage for feeding Walker-Gordon cows all year 'round A reason why Walker-Gordon cows produce, all year 'round, milk that is uniform in nutritional characteristics and quality

This Man Is Busy Improving on Nature—one of the functions of Walker-Gordon Laboratory Control is enriching the soil that grows the crops that nourish Walker Gordon cows Special mineral foods are prescribed for the earth, making crops richer in nutrients—helping in turn to make Walker-Gordon Certified Milk richer in nutritional values.

Pennies for Health—the price of Walker Gordon Certified—the milk made especially for children from nine months before birth to nine years after—is much lower than it used to be, only a few pennies more than that of grade A milk perhaps the cost of a newspaper

THE NATURAL MINERAL WATERS OF SARATOGA SPA
ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK

In Functional Conditions of the Stomach

conditions resulting from hyposecretion and hypomotility, the indications are those for which the naturally carbonated, saline-alkaline waters of the Spa are primarily recommended The results obtained are indicated by an improved elimination through the intestinal tract and relief of pain and discomfort in the upper abdomen

In some patients with hyperacidity distinct benefit and relief of symptoms are obtained from the use of Geyser—the alkaline-saline water of the trio bottled for physicians' use.

Hathorn, the purgative, and Coesa, the gall bladder water, are of the same general type but differ in mineral content and saline-alkaline ratios

Professional literature on all three is available on request as is also a physician s sample carton (4 bottles) for those desiring to conduct clinical tests Write on your professional letterhead to W S McClellan M.D Medical Director Saratoga Spa 155 Saratoga Springs N Y

SUPPORTING CASE HISTORIES

SECONDARY AND NUTRITIONAL ANEMIAS RESPOND TO McKESSON'S COPPER-IRON COMPOUND

Both individual case reports and laboratory investigation attest the value of McKESSON'S COPPER-IRON COMPOUND where a blood regenerative is indicated Many authoritative studies indicate that the addition of a small amount of copper to iron activates the iron, quickens its absorption and produces uniformly better results than iron alone The case histories below bear this out

Case No I—Mrs. D, age 27, secondary anemia and general rundown condition. September 18, had 3,200,000 red blood cells; hemoglobin 55%. On September 20, she was given two bottles of McKesson s Copper Iron Compound and directed that she take two teaspoonfuls three times a day until first bottle was consumed and one teaspoonful three times a day from the second bottle On October 15 (exactly four weeks later) her red blood cells numbered 4 600,000; hemoglobin 75% She was then given two more bottles and directed to take one teaspoonful three times a day On November 17, her red blood cells were 5,100,000 and hemoglobin 85%.

Case No II—Mrs. J, age 30 On October 1, had 2,800,000 red blood cells and hemoglobin of 50%. On that day she was given two bottles of McKesson's Copper Iron Com pound with directions to take two teaspoonfuls three times a day On the 15th of October her red blood cells numbered 3,800,000, her hemoglobin 60%. On November 3, after continuing on the same treatment, her red blood cells numbered 4,700,000 and hemoglobin 80%. Without further treatment, on November 24, her red blood cells numbered 4,800,000 and hemoglobin 85%.

Case No III—Mrs. R. M. Reported to physician on September 8 Hemoglobin 57%; red cell count 3,890,000 She was given two bottles of McKesson's Copper-Iron Compound and on September 25, her hemoglobin was 66%, red blood count 3,910,000 On November 10, after taking two more bottles, her hemoglobin was 66%, red count 4,080,000 On December 3, after continuing this same treatment her hemoglobin was 74% and red blood count 4,400,000

Case No IV—Mr H S Man with secondary anemia following acute hemorrhagic nephritis On September 22, his hemoglobin was 72%; red blood count 3,820,000 This man took one bottle of McKesson s Copper Iron Compound, and on October 23 his hemoglobin was 76%; red blood count 4,040,000; white count 11,500; polys 72; lymphs 28; color index 9 The above patient was very active and found it difficult to take this preparation with any degree of regularity There was an improvement in his condition, however, as noted in the above figures.

McKesson s Cop per Iron Com pound is manufac tured under license from the Wisconsin Alumni Research Foundation Hart Patent No 1,877,237

PROTECTED *Milk Products*

THE Dairymen's League is not content merely to supply just milk. All Dairylea farms are selected for their ability and willingness to produce PROTECTED Milk—milk that is pure and clean In other words, we appreciate the value of milk as an important food —we realize that only pure, wholesome milk is worthy of human consumption

Working on this basis, we have developed and adopted the latest scientific methods for the safe handling of milk. We make sure that every herd is health certified by a licensed veterinarian

With healthy cows and rigidly controlled handling methods, the members of the Dairymen's League are producing milk products which you can unhesitatingly recommend to your patients Dairylea producers consistently live up to their slogan—"Inspected-Protected"

DIRECT FROM OUR FARMS TO YOU — DAIRYLEA

Produced by

THE DAIRYMEN'S LEAGUE CO-OPERATIVE ASSOCIATION, INC

Our Pledge: We, the farmers of the Dairymen's League, recognize a definite obligation to the public. Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality.

RANTOSILK *and* HOLLANDEX
For Home and Hospital Use

● For bed sheets, pillow cases, surgeons' aprons, and surgical garments used in hospitals, take advantage of Rantosilk or Hollandex—the last word in processed surgical fabrics They are fine silk and lawn calendered with crepe rubber—are light in weight and will outwear much heavier material.

Their ability to withstand creasing, rolling and folding without the slightest harm to the surface commends it for hospital use They may be washed, boiled, autoclaved, stitched. Will not crack, peel, fade or stick. Resistant to acids, alkalies and heat. The positive impregnation with rubber of each fibre accounts for the superiority of Rantosilk and Hollandex.

THESE 3 *Drinks a day*

PROVIDE IMPORTANT FOOD ESSENTIALS

In their search for a food that supplies Calcium, Phosphorus, Iron and Vitamin D—usually lacking or deficient in the average 3 meal a-day diet—physicians have found in Cocomalt an appetizing answer More and more, they are prescribing Cocomalt, the *"protective food drink"*, for expectant and nursing mothers, run-down men and women, and under-nourished children

Each ounce serving of Cocomalt provides 15 gram of Calcium, 16 gram of Phosphorus And aiding in the utilization of these food minerals, each ounce of Cocomalt also contains 134 U S P Units of Vitamin D, derived from natural oils and biologically tested for potency Further, leading authorities agree that Cocomalt supplies the normal patient s daily Iron requirement each ounce serving being fortified with 5 milligrams of effective Iron which has been biologically tested for assimilation

Hot or cold, Cocomalt s distinctive flavor appeals to old and young, alike It is obtainable in ½-lb , 1 lb and the economical 5-lb hospital size, purity sealed cans at grocery and drug stores

	1 Ounce of Cocomalt adds	1 Glass of Milk (8 Liquid Ozs.) contains	Thus, 1 Glass of Cocomalt and milk contains
†IRON	0.005 GRAM	*TRACE	0.005 GRAM
†VITAMIN D	134 U.S.P. UNITS	*SMALL AMOUNT; VARIABLE	134 U.S.P. UNITS
†CALCIUM	0.15 GRAM	0.24 GRAM	0.39 GRAM
†PHOSPHORUS	0.16 "	0.17 "	0.33 "

THERE CAN BE NO COMPROMISE WITH QUALITY

- Knowing how to make good pharmaceutical products for more than eighty years does not in itself supply the answer to the question WHY Poythress has upheld the confidence of physicians
- The answer lies deeper—in the quality of the products themselves Exceptional purity of ingredients make results more predictable.
- Quality is the cornerstone on which confidence is built

KNOX . . . CLINICAL NOTES

ONE OF A SERIES OF CORRESPONDENCE EXCHANGES WITH PHYSICIANS ABOUT KNOX GELATINE.

QUERY about the Allergic Manifestation of KNOX GELATINE

A doctor writes, "Would you kindly tell me from what sources the materials used in making Knox Gelatine are obtained? I am especially interested in whether or not it is all beef, all pork, all sheep, or a mixture of proteins from different animals; also is the manufacture constant as to the ingredients used? This is very important to me as I want to use it for special diets in allergic cases, and for this purpose the exact sources of a food must be known and unvaried"

Knox Gelatine Laboratory REPLY

Knox Gelatine is scientifically prepared from carefully selected long, hard, shank *beef bones only*. Twenty-one control and laboratory tests are made throughout the process of its manufacture. As far as we know, no case of allergy has ever been traced to the use of Knox Gelatine. Contrariwise, there is reason to believe that when Knox Gelatine is added to milk, patients sensitive to milk will show no allergic response.

Sample and useful Dietary Booklets on Request. Write Dept. 474

A GOOD EXAMPLE OF A CONCENTRATED KNOX GELATINE RECIPE

THE KNOX MILK STIR

Place the contents of 4 envelopes of Knox Gelatine in an ordinary drinking glass. Add 4 ounces of cold milk and allow to soak for five minutes. Add 2 more ounces of milk and stir until thoroughly soaked. Then place glass in small cooking kettle of hot water until gelatine milk mixture is thoroughly dissolved Add 2 more ounces of cold milk, which will bring the temperature to a satisfactory warm drink of about body heat. A tablespoonful of prune juice or a few drops of any bland flavor like vanilla may be added.

Total 8 oz. liquid—about 250 calories

Why you should insist on Knox Sparkling Gelatine

Because Knox Gelatine is 85% protein in an easily digestible form,—because it contains absolutely no sugar or other substances to cause gas or fermentation, Knox Gelatine should not be confused with factory-flavored, sugar-laden dessert powders. Knox is 100% pure U S P gelatine. Knox Gelatine has been successfully used in the dietary of convalescents, anorexic, tubercular, diebetic, colitic, and aged patients.

effective method of treating not only the more malignant inoperable lesions, but those more favorably situated and less malignant"

Reviewing an earlier series of fifty-one cases, Hunt reported that ten patients died within seventy-five days of the diathermic treatment, two from general peritonitis, and the others from pyelonephritis Eight patients died within a year either from the primary disease or from recurrence elsewhere in the bladder, fourteen whose tumors were graded I and II, had recovered from the operation and survived without recurrence. Hunt concludes that irrespective of the method of treatment the results obtained are directly dependent upon the degree of malignancy and the place in the bladder where the growth originally appeared "The results are better in the low grade malignant lesions and the lateral walls and dome than in the highly malignant lesions and the base of the bladder" This writer nevertheless adheres to his belief in the advantages of surgical treatment, yet other workers in the same clinic—Counsellor and Braasch—are of the opinion that "the advantages of diathermy as a transvesical procedure for inoperable or non-resectable lesions of both high and low grades have not been sufficiently recognized"

The superiority of diathermy over purely surgical measures has been quite conclusively demonstrated by records of clinics where this method has been in use for a time period long enough to permit evaluation of end-results At the Los Angeles General Hospital, for example, a report on the use of diathermy in vesical malignancy was made by Negley as far back as 1928 The results seemed "to favor fulguration or surgical diathermy either through a closed or open bladder" as the best method for handling vesical malignancy In 1936, another report from this same clinic concludes "surgical diathermy offers a possibility of cure greater than the risk involved in its application No other form of treatment of tumors of the bladder proved as efficacious"

But in a report made by Parmenter and Leutenegger last year it was emphasized that "a study of the carcinoma group (of bladder cases) disclosed the futility of fulguration alone" They add, "Those patients who received the larger doses of radium, seemed to obtain the best results" These opinions are shared by Dean of the Memorial Hospital

It has been my personal experience that whatever surgery can accomplish can be effected by other means with less risk and discomfort to the patient But the best results are not obtained by adherence to any single agent, or by confining oneself solely to an established method to be applied to all cases alike. The accurate treatment of a vesical neoplasm involves the conscientious study of the individual case, the careful measurement of the lesion to be treated, and a thoughtful evaluation of all the factors involved I rule out indiscriminately for all cases resection because I am convinced that in this way the cancer cells are disseminated more rapidly Recurrence takes place by direct implantation near the site of the original lesion Metastasis on the other hand occurs just as frequently in more or less distant areas because clamping and manipulation of the tumor mass introduce the cancer cells to the venules and arterioles

Dependence upon fulguration alone is open to the objection that we must confine our efforts to the actual tumor tissue It is too dangerous to attack the surrounding apparently healthy tissues, for such extensive injury to the bladder wall would bring about a condition worse than the original malignancy Radium implantation has proved itself efficient in taking care of this zone of potential malignancy surrounding the macroscopically visible tumor, but the implantation of extensive papillary growths or those of the solid, infiltrating type, is apt to be difficult and unsatisfactory One of the chief of these drawbacks is the impossibility of estimating accurately the number of radio-active centers needed to give adequate treatment.

A combination of several agents answers all these objections save that of correct estimation of the extent of the tumor

To obviate this last difficulty I have designed an instrument which permits measurement of the tumor base through the endoscope after the superficial portion has been removed by electrocoagulation Radon implantation is carried out with the same instrument, and

upon whom surgery is performed, and in some instances, even longer

The third group makes use of fulguration, but follows it by radiation with x-ray, radium or both In this third group are also classified those who use x-ray or radium alone This might be termed the *physical therapy group* in that they have definitely abandoned surgery

Let us first take up the case for surgery It is statistically established that the majority of bladder tumors are inoperable from the outset because of being located in an inaccessible position Tumors originating on the lateral walls usually involve one or both ureteral orifices Lateral wall growths comprised 41 89 per cent, and trigone and bladder neck tumors 34 41 per cent of the 854 vesical tumors classified by the Registry of the American Urological Association The Carcinoma Registry Committee points out that this fact has an important practical aspect with respect to treatment, as from the surgical standpoint only 23 4 per cent of these tumors are readily accessible for complete excision without interfering with the ureter or the urethra Thus tumors of the lateral walls almost invariably require transplantation of one or both ureters, while those involving the trigone and bladder neck are surgically unapproachable except by using total cystectomy and bilateral ureteral transplantation "It would appear, therefore, that any method of treatment to become generally acceptable must take into account the high percentage of bladder tumors in these areas, and the hazards of a purely surgical approach"

When the high mortality of vesical surgery for tumor is pointed out the surgeons are prone to defend their position by saying that if the patients presented themselves for treatment earlier, the surgical results would be correspondingly better But in opposition to this view is the fact that lesions seen early are readily amenable to far less radical measures than bladder-wall resection or total cystectomy It is impossible to imagine that the surgeon, if he were himself the patient (as not infrequently has happened), would choose resection or total cystectomy when he was well aware that gentler measures would bring about the desired result And the point of view of the lay patient would undoubtedly be the same I doubt very much if there is one person here who would elect cystectomy The immediate mortality in the best equipped hospitals has been reported as high as fifty-three per cent, and five-year "cures" are very, very rare We must take into consideration also the fact that most of these bladder tumor patients are over sixty years of age How long can such a person reasonably expect to live, even if he had no cancer?

In deciding to use radical surgery, a very heavy burden of responsibility is rested upon the operating surgeon Only growths of the highest grade of malignancy which are sure to cause death very shortly unless completely eradicated, can justify extreme measures Very often biopsy is not done, and the malignancy of the growth is judged by its clinical appearance, which may be highly deceptive Examination of the tissue after it is removed may tell quite a different story It seems altogether probable that some of the long survivals after resection may be due not so much to the thoroughness of the removal, but to the essentially low grade of malignancy of the excised growth or one that is but potentially malignant

The group of surgeons who advocate fulguration of all vesical neoplasms with resort to surgery if fulguration fails, point to the much higher incidence of five-year survivals as proof of the superiority of their methods But the records of *controlled diathermy*, as the newer methods of using heat are usually designated, are not actually much better than those of resection, *if diathermy alone is employed*

In 1933 Counseller and Walters reported on seventeen cases of bladder tumor where they had used diathermy, or as they term it, "transvesical electrocoagulation" The method was restricted to patients who had tumors of the infiltrating type confined to the base of the bladder and "considered non-resectable" When the report was made, fifteen of these patients were still alive, one having lived more than ten years "If it is considered that the cases were judged to be inoperable the results indicate that the patients who lived less than five years, and who were treated by diathermy, undoubtedly lived longer and in greater comfort because of this treatment It should, therefore, be considered a very

CERTAIN RECENT DEVELOPMENTS IN CHEMISTRY

Their Bearing on Cellular Activity

WM DEB MACNIDER, M D, *Chapel Hill, N C*

Kenan Research Professor of Pharmacology and Dean of the Medical School, The University of North Carolina

The purpose of this lecture is to serve as an unnecessary memorial to a man Unnecessary, on account of the fact that his intellect as teacher and investigator operating as such and with a vision, has so impressed itself on this Institution that he will go on so long as it goes on Being a memorial lecture it should consider the man both first and last, and I shall attempt this Between such periods of happy thoughtfulness will be placed certain statements of a scientific nature which I trust he would care for, scientific developments in which he would have rejoiced and would have expounded in his charming fashion to his students of chemistry and pharmacy

It was not my good fortune to know Professor Charles Frederick Chandler and yet any one may know this man A glance at one of his photographs shows a man with strength and poised determination, a kindly eye that looks into the future with understanding and assurance, a person who loves the right and abhors the wrong, with a strength This gentleman and eminent scientist gave his life with a freedom in and for Columbia University He was, and his attainments here are of a university order of excellence Such people are a university Their spirit as a university fails to perish

It is interesting that I have found a local state connection with Professor Chandler Through my state I knew him before either Union College or Columbia University knew him Professor Chandler's dissertation for the degree of Doctor of Philosophy at Göttingen in 1856 was entitled "Miscellaneous Chemical Researches" The first one of these investigations was on "Zircon From Buncombe County, North Carolina" Therefore it may be in some measure appropriate for the Chandler Centenary Committee to have asked me from a nearby county to make this lecture as a part of the memorial to Professor Chandler

In the spring of 1866 Professor P W Bedford of Columbia College called Professor Chandler to ask him if he would lecture in Chemistry at the College of Pharmacy His reply was "What is it and where is it?" He asked for twenty-four hours in which to consider the matter and deciding that pharmacists belonged to a class that needed a thorough scientific education, he accepted the offer without and with no thought of remuneration A student of Professor Chandler's life will gather a certain significance from this decision No doubt with the vision which he ever had, he saw here not the indiscriminate compounding of largely worthless substances to operate ineffectively in individuals but chemical bodies of known composition influencing through scientific laws the activity of highly complex living tissues With this interpretation on my part of Professor Chandler's vision in the above mentioned connection, a vision which has become a reality for the College of Pharmacy, I would care to talk briefly here on "Certain Recent Developments in Chemistry—Their Bearing on Cellular Activity"

One of the earliest discoveries of the existence of a specific chemical substance influencing in terms of augmentation cellular activity was made by Bayliss and Starling[1] through their observation that a chemical body from the duodenal mucous membrane stimulated the cells of the pancreas The establishment of a fact of such an order is sufficient in itself, but the principle established through it with its many implications transcends the discovery Such an observation of the existence of so-called chemical messengers in the organism—hormones—at once raised the question whether or not function on the part of cells as organs might not be due to such chemical bodies produced in an organ location or remote from it either acting as augmentors or inhibitors of the activity of a given group of cells and

Chandler Memorial Lecture given under the auspices of Columbia University, New York City, October 13, 1937

treatment concluded by a series of deep x-ray exposures begun ten days later

In conclusion I would emphasize my belief that the risks of surgery far outrank the advantages of a possible complete cure in patients of advanced age, that a proper combination of electrocoagulation with subsequent radon implantation and eventual x-ray therapy is always to be preferred, and finally, that our hope of bettering our results in the treatment of bladder neoplasms lies in the intelligent employment of all the resources at our command, especially those which will lead us to better and more prompt diagnosis The present high mortality of bladder tumors is a challenge to the urological profession Let us not permit it to go unaccepted

A CRUISING X-RAY LABORATORY

The New York State Department of Labor marked another advance in its campaign for the prevention and eradication of silicosis and other industrial dust diseases when it launched its "Cruising X-Ray Laboratory"—an especially built body on a school bus chassis, containing full x-ray equipment. State Industrial Commissioner Elmer F Andrews announced that this traveling laboratory will be sent to the industrial centers throughout the State where dust hazards are known or suspected to exist. By tying in to plant electric power the Department's x-ray truck will provide completely equipped quarters for medical and x-ray examination of plant employees in the immediate vicinity of their work

During the past year more than 5,000 x-ray photographs were taken of workers exposed to silicosis hazards in the foundry industry It was in this work that the necessity for a cruising laboratory was demonstrated Without the truck equipment, the investigators and x-ray operators of the Division of Industrial Hygiene have been required to cart their bulky apparatus and plates about in a sedan.

An x-ray laboratory had to be improvised in quarters provided in industrial plants that were often inadequate for the purpose This was necessarily a cumbersome and slow procedure and not conducive to the best results While the foundry study was completed under these somewhat adverse conditions, there still remain similar surveys to be made in occupations such as the following Metal polishing, rock-drilling, quarry work, mining, stone finishing, sand blasting, work with asbestos, vitreous enamels, pottery and glass, work in factories where soap and scouring powders are manufactured, and in plants where abrasives are used in cleaning and polishing operations It is estimated that within this group of occupations approximately 7,500 workers in New York State are exposed to an extreme dust hazard while 13,000-14,000 more are exposed to a dust hazard which is somewhat more moderate

The Department's portable laboratory is the first of its kind to be built. The overall body dimensions of the laboratory are 17′ 9″ long x 7′ 4″ wide with a 7′ clearance between floor and ceiling The rear half of the structure is devoted to a reception and examination room that is 10′ 6″ long x 7′ 4″ wide This room is lighted by a large rear window, a side window and a door window and two dome lights in the ceiling There are electric outlets for heaters in cold weather and fans in warm weather

The x-ray room is 7′ 3″ long and 5′ wide. In the x-ray room are the radiographic tube, tube stand and plate holder The walls of the room are lead-lined A door leads from the x-ray room to the street so that workers being examined will enter through the door leading into the reception room, and go out through the exit door in the x-ray room

tionship within the heart between these two functionally opposed factors of a specific chemical nature

These experiments have been discussed not for the purpose of elucidating their significance as such but in order to emphasize a type of tissue change of a chemical order, the importance of which is even now in the beauty of its scientific birth They stimulate thoughts to be substantiated by facts of specific chemical interaction in tissues the romance of which we are not yet in a position to realize Such thoughts, hopes, and possibilities are of a nature which would thrill the intellect of Professor Charles Frederick Chandler

Considerations of the significance of changes of a chemical order apply to processes of disease as well as to those of physiological life In this connection, but for the present as primarily concerned with cell morphology, studies have been in progress in my laboratory for a number of years which have taken into consideration the susceptibility or the acquired resistance which fixed tissue cells may have to a variety of chemical substances Such states of susceptibility and acquired resistance associated with certain modifications in cell morphology likely depend upon changes in the chemical or physicochemical status of such cells In turn such states of cells indicating resistance or susceptibility if seen broadly, should be interpreted as factors involved in the general question of cell and organism adaptation

Many years ago in studying the regenerative capacity of kidney epithelium following the ligation of one branch of the renal artery,[6] the observation was made that after such an interference to the blood supply of the kidney it was impossible for epithelial cells normal for the convoluted tubules to replace those cells which had been caused to degenerate In place of cuboidal, highly specialized cells replacing those cells which had degenerated, this normal type of cell was replaced by a flattened cell of a different order In other words the injury to the kidney had so changed it that a specialized cuboidal cell could not adapt itself to such an environment while a cell of a less specialized nature could effect such an adaptation The observation implies, without adequate proof, that the flattened less specialized cell was of such a physical structure and chemical constitution as to enable it to survive in a renal environment unsuitable for the normal type of cell Such observations may be of significance in our thinking about cell life and the adaptations of such life to unfavorable environmental surroundings which we call disease They make it difficult for us to decide what disease in terms of cell change is Certain tissue changes which we now designate as disease, relegate to the pathological and consider essentially harmful and opposed to life may be changes in terms of adaptation which enable an organ or an organism not to die but to live even though as a result of such changes the organ or the individual has to live at a lower level of physiological effectiveness Such changes therefore become a mechanism of defense and impart resistance of an acquired nature

Much later than these experiments, the observation[7-10] was made that when dogs were intoxicated with two mg of uranium nitrate per kilogram they developed only slight evidence of a kidney injury in the main characterized by edema and partial necrosis of the epithelium of the convoluted tubules In general such animals recovered from the kidney injury with a restoration in renal function The repair processes in such kidneys consisted in so far as the injured epithelium was concerned, in the formation in the convoluted tubule area of cells morphologically normal for this segment of the tubule When such animals were reintoxicated by the same amount of uranium per kilogram, the epithelial cells of a normal type which had replaced the injured epithelium failed to show any acquired resistance to this poison The sequence of events then, was as follows A slight injury to the cells of the convoluted tubules is followed by a process of repair characterized by the formation of a normal type of cell having the usual affinity for this chemical substance so that no resistance to the poison is acquired as a result of the process of repair Other animals were intoxicated with a larger amount of uranium—four mg per kilogram Many of these animals failed to survive the acute kidney injury for such a degree of intoxication develops in the same location of the tubule as was observed when a smaller amount of the

finally when such organs operated in terms of balanced and perfected function, if this balance was not due to a normal quantitative interaction between augmentor and inhibitor This type of thought lends itself to considerations other than the function of organs Growth and development, youth and senility may find an explanation through the presence or lack of some chemical substance influencing tissue activity and malignant growths may conceivably be due to a chemical body which either stimulates a given type of cell to abnormal proliferation or to one, the absence of which removes a restraining influence from such cells Certainly very recent investigations lend emphasis to the chemical regulation of cellular activity

In 1906, Reid Hunt and Hunt and Taveau[2] described certain remarkable results in terms of augmentation of function produced by extremely high dilutions of acetylcholine when given intravenously to animals, later Taveau and others described in detail the action of many of the chemical analogues and derivatives of such a body It is good to think about these isolated, initial discoveries Facts as facts, no matter how detached, have the power of standing firm in the beauty of their truthfulness and not infrequently as has been the case with Hunt's discovery such facts have served as the core, as the "leaven to lighten the whole loaf" of a new domain of understanding of the influence of specific chemical substances on cellular activity

In 1914 Dale[3] greatly extended the work of Hunt and Taveau by showing that acetylcholine in the amount of one gamma or less per kilogram of body weight in an animal would cause a fall in blood pressure due to vasodilation of certain blood vessels and that this effect was abolished by atropine Larger doses of this substance slowed the heart and modified its contractility in a manner resembling the influence on the heart of the vagus nerves These observations indicated that a chemical body—acetylcholine—acted in the same fashion as stimulation of certain parasympathetic nerves which in turn raised the very important question whether or not nerve stimulation as such brought about such changes in the blood vessels and heart or whether the nerve stimulation caused the liberation of a chemical mediator which influenced a specific type of cell, a tissue as an organ, either in terms of functional augmentation or inhibition The thought at least carries itself beyond the nerve as nerve impulse, to a something which must be highly specific in its functional influence.

In 1921 Otto Loewi[4] following a sleepless night of thought performed his crucial experiment by which he demonstrated that if the vagus nerve to the frog's heart was stimulated while the heart was being perfused by an inert physiological solution that some substance passed into the perfusate which when transferred by perfusion to a second heart produced a similar effect to stimulation of the vagus nerve Loewi later showed that this substance having a vagus slowing effect on the heart resembled acetylcholine in that hydrolysis would cause its disappearance, that its action was made negative by the use of atropine, and that it was readily destroyed by an enzyme present in blood and tissue juices The experiments proved that an acetylcholine-like substance was the chemical mediator acting in the capacity of inducing cardiac inhibition while another chemical body of plant origin—atropine—served as a substance which could prevent the action of this chemical cardiac inhibitor through its action on vagus nerve endings Since this work of Dale and Loewi numerous investigators have extended the study of acetylcholine and related bodies to explain their chemical influence on a variety of tissues other than blood vessels and heart muscle and to show the antagonism which exists between such bodies and substances of vegetable origin as atropine and physostigmine

Studies of a similar order of magnitude in connection with chemical mediators of a cardiac augmentor nature have been made by Cannon and his school of investigators [5] They have demonstrated that just as vagus stimulation to the heart leads to the liberation of a chemical mediator of inhibitory power so stimulation of the sympathetic accelerator nerves to the heart induces the liberation within it of a chemical mediator of augmentor power Cannon designates this substance "sympathin" Thus the balanced action of the heart muscle in terms of contraction—systole—and rest—diastole—is likely due to an adjusted chemical quantitative rela-

a complete resistance against the toxic action of chloroform Several weeks later, when the same animals were starved not for twenty-four but for forty-eight hours and anesthetized with chloroform for four hours, commencing areas of necrosis could be demonstrated in the center of the liver lobules

The latter observation indicates that tissue resistance cannot be considered as absolute. Fixed tissue cell resistance as resistance of any other order is a relative value

A final group of experiments[14] are of peculiar interest and importance as they take into consideration the factor of age. During the past sixteen years of study in which the liver of the dog has been considered in certain experimental procedures, ninety-four animals have been used which may be considered senile both on account of their age (8 to 23 years) and on the basis of certain superficial physical changes common to the senile state in any of the higher animals, including man Twenty-two of these animals have shown livers with a diffusely changed type of liver cell The cells were not of a normal polyhedral contour but were similar in configuration to those cells which had been made to appear as a repair process in the liver secondary to a severe injury from uranium The cause for the occurrence of this type of cell in the livers of certain senile animals is entirely unknown The question following this observation then quite naturally arose as to whether these atypical liver cells formed in the liver in association with the senile state were resistant to chloroform Such animals when starved for twenty-four hours and given chloroform by inhalation for 1½ hours have shown a complete resistance against this chemical body which is certainly toxic for normal hepatic epithelium

The foregoing experiments have been outlined in some detail even in their incomplete form to emphasize certain thoughts of a biological order concerning the morphological fixity of tissue cells, the acquired resistance of such so-called fixed cells and the probability that changes of a chemical or combined physicochemical character may be responsible for both susceptibility and an acquired resistance on the part of such cells The experiments establish certain facts which may be of broad biological and medical significance. First, certainly for a given location in the renal tubule and in the liver we have to accept the observation that when such fixed epithelial cells are subjected to a sufficient degree of injury which connotes susceptibility that a repair process may be instituted that results in the formation of a different type of cell in such locations which has acquired a high degree of resistance not only to the chemical agent which inflicted the injury and precipitated the atypical repair process but a resistance to chemical bodies of an entirely different chemical order from the injurious agent Excluding changes in surface tension and cell membrane permeability which may be associated with changes in cell configuration we perhaps have the right to infer, not to state as a fact, that when changes in cell morphology develop in fixed tissue cells as a reaction to injury and constituting a repair process or that when such morphological changes occur as a localized organ expression of senility, that the chemical constitution of such atypical cells becomes so altered that they no longer have those chemical receptors which can bind a given poison in sufficient concentration to seriously impair the function of such resistant cells or to so change them structurally that these changes can be microscopically demonstrated

Finally, my belief is that it would be investigations of such an order which would warm the heart and excite the interest of the great chemist, the chemist of industry and helpfulness, Professor Charles Frederick Chandler, whose birth we commemorate with thankfulness

nephrotoxic agent was employed, but is more severe, usually resulting in a severe necrosis of the cells in this portion of the nephron In those animals which effected a survival from such an order of renal injury the repair to the convoluted tubules was by an atypical, flattened, often syncytial type of cell, a cell very different morphologically and in certain respects chemically from the normal, specialized, cuboidal cell In such animals the observation was made that associated with such a change in the morphology of these cells effecting a process of repair, the kidney had acquired a fixed tissue cell resistance not only to the amount of uranium which induced the initial injury but to an amount two to four mg per kilogram in excess of this toxic quantity In those animals of this second group that survived the acute uranium injury a repair process was instituted in the kidney characterized by the relining of the injured tubules with a changed type of epithelium which in turn was resistant to this chemical poison It is justifiable to assume that such cells are exposed to uranium for the substance appears in the urine of the animals The intracellular mechanism of a chemical or physicochemical character which prevents the poison from effecting an injury to this type of regenerated cell is entirely unknown

In recent years this same type of experimental procedure has been undertaken with the liver as the organ of study[11] These experiments in the first place indicated that the liver when injured by uranium reacted in terms of cell regeneration and resistance in a manner similar to that which has been described for the kidney in that a slight injury to the liver by two mg of uranium nitrate per kilogram was followed by a process of epithelial repair which resulted in a return of the liver to a cytological normal, that associated with this type of normal epithelial cell replacement, the liver failed to acquire an epithelial cell resistance to the poison However, if the liver was severely injured by four or six mg of uranium per kilogram, an abnormal type of epithelial repair developed consisting in the formation of flattened cells in cord formation which were not infrequently not differentiated but remained as syncytial structures This form of cell was shown to be definitely resistant to uranium. These experiments were of significance in that they demonstrated that a type of cell change first noted in the kidney had the same characteristic of an acquired resistance when they were made to appear as a repair process in another organ with a different functional expression and composed of an epithelium normally different from that of the kidney

Many years ago the observation was made by Whipple and Sperry[12] that if a dog was starved for twenty-four hours and given chloroform by inhalation for 1½ hours, there invariably occurred as an expression of the toxic action of the chloroform for the liver a necrosis or death of the central one-third to two-thirds of the cells of the liver lobules Taking these experiments as a standard reaction on the part of the liver to chloroform, the following investigation was undertaken to ascertain if liver epithelium could be so altered by an injury followed by a repair process as to impart to the liver epithelium an acquired resistance against this certainly acting hepatoxic chemical agent—chloroform

In conducting the experiments a first group of dogs were given two mg of uranium nitrate per kilogram As has been stated, the liver injury inflicted by such an amount of uranium is followed by a repair to the epithelium with the formation of a normal type of polyhedral liver cell When such animals were starved for twenty-four hours and given chloroform for 1½ hours, there developed in the liver a central necrosis of the liver lobules effecting one-third to two-thirds of their area These experiments show that if the liver be slightly injured by a poison, in this instance uranium, which in turn leads to a normal type of cell repair, that such cells have no resistance against chloroform A second group of dogs were intoxicated by a larger amount of uranium —four mg per kilogram A certain number of these animals failed to survive Those animals effecting a survival from this degree of injury to the liver repaired the liver not by the formation of a normal type of liver cell but by cells of altered morphology which were flattened, stained intensely, had prominent nuclei and which not infrequently existed as undifferentiated syncytial structures When animals with this type of atypical liver cell repair were starved for twenty-four hours and anesthetized with chloroform for either one and one-half or three hours the liver epithelium was found to have acquired

the anatomy of the appendix that predispose it to infection *First,* it is a narrow cul-de-sac, exposed to a fecal stream with a high bacterial content, where stasis and easy obstruction are common, *second,* it has a considerable lymphocytic element which may be as susceptible to inflammatory reaction as other lymphocytic tissues of the body

The obstruction of the lumen by the formation of fecaliths, by the presence of foreign material, by cicatricial strictures, and by kinks, no doubt, accounts for a high percentage of the cases of acute appendicitis It is assumed that secretions are dammed beyond the obstruction and tension diminishes the resistance of the mucosa to increasing numbers of bacteria Invasion of the mucosa, passive congestion of the wall, vascular thrombosis with eventual gangrene and perforation represent a progression that can be seen at any stage at the operating table The entire process may take little more than eight to ten hours, or as long as several days, again it may regress from any stage in this course

The factor of obstruction has been admirably demonstrated experimentally by Wangensteen and Bowers,[3] but to account for every case of appendicitis on this basis is hazardous In this series, only thirteen per cent of all cases of acute appendicitis were found to have hard fecaliths in the lumen, the presence of soft feces was not considered abnormal It appears significant that in the more severe forms of appendicitis, there was a greater incidence of these concretions, in acute appendicitis without perforation their incidence was eleven per cent while in the cases with perforation, it was twenty-eight per cent Seeds, splinters of wood, hair bristles, and other foreign bodies were found in the lumen of the appendix in less than one per cent of cases

Intestinal worms were found in the lumen in seven cases of acute appendicitis (and in seven cases of nonacute) In twelve instances the worm was Oxyuris vermicularis, in one, Ascaris lumbricoides, and in another, Tenia saginata It is not apparent whether these parasites produce appendicitis by mechanical obstruction of the lumen or by ulceration of the mucosa They are known to cause ulceration in other parts of the bowel, but it is interesting that ulceration of the mucosa was conspicuously absent in all but one of the cases, both acute and nonacute The appendix infested with the Tenia saginata had perforated and formed an abscess After simple drainage of the abscess, several lengths of the worm came out through the fistula There was an eosinophilia of from four-ten per cent in all of the

CHART I—DISTRIBUTION OF 886 ACUTE CASES ACCORDING TO AGE

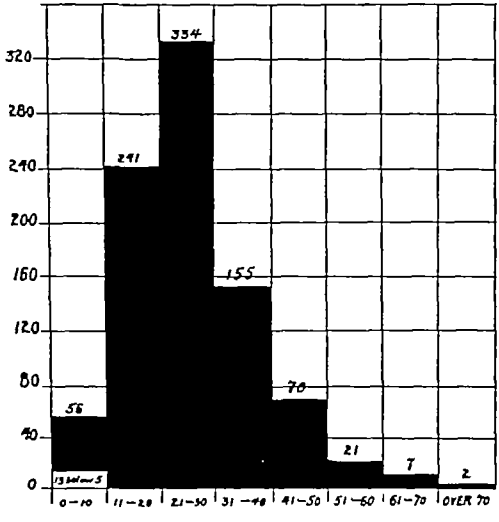

TABLE I

		Number of Cases	Deaths	% Mortality
ACUTE APPENDICITIS				
Acute Appendicitis — Unperforated		727	2	0 27
Appendicitis — Perforated & Local Abscess		99	5	5 0
Appendicitis — Perforated & Spreading Peritonitis		60	12	20 0

A STUDY OF APPENDICITIS

1500 Cases at the New York Hospital

BRONSON S RAY, M D, *New York City*
From the Department of Surgery of the New York Hospital and Cornell Medical College

It has been the practice of the New York Hospital periodically to report its statistics on appendicitis, the last report [1] completed the analysis of the cases at the old New York Hospital which closed its doors in July 1932 So many of these studies flood the current medical literature that there seems little more to add But all agree that there are aspects to the disease about which the last word has not yet been said, and the mortality rates testify to a need for this attitude. New York City's death rate from appendicitis has consistently averaged about fourteen per 100,000 population each year Krech[2] personally studied the records of 4,542 cases of acute appendicitis for the years 1921 and 1931 in fourteen representative hospitals in the city and found the operative mortality to be seven per cent These figures, while several points lower than the estimated averages for the country, are not enviable and call for concerted effort for improvement

This study includes not only those cases that proved to be acute appendicitis but also those with nonacute disease of the appendix and those in which the appendix was removed as the result of a mistaken diagnosis

There have been 1,500 operations for presumed or actual appendicitis done by the Surgical Department of the New York Hospital between September 1, 1932 (when the new hospital opened its doors) and January 1, 1937 This number does not include cases in which the appendix was removed incidental to some other abdominal operation, though a few cases are included in which some minor procedure was done incidental to the appendectomy Eighty-seven per cent of those cases performed before July 1936 have had adequate follow-up studies

A simple combined clinical and pathological classification of cases has been used (Table I) Any attempt at further subdivision has led to confusion and inaccuracy, particularly is this true in those cases of spreading peritonitis where the perforated appendix has not formed a local, walled-off abscess Borderline cases of "mild acute" appendicitis and those of "periappendicitis" resulting from primary inflammation elsewhere have all been classed as nonacute

There were twenty-one deaths in the 1,500 cases, nineteen in the acute and two in the nonacute The numbers for each group and the percentage mortality are indicated in Table I The mortality for all types of acute appendicitis is 2 1 per cent, a gratifying figure which represents factors over which there has been no control as well, perhaps, as factors over which some control has been possible. The mortality approaches zero when the appendix has not ruptured, but rises alarmingly when it has The two deaths in the nonacute group occurred in cases of mistaken diagnosis—acute glomerular nephritis and postabortional septicemia, in neither one of which was it felt the operation contributed to the death

Acute Appendicitis

Age and Sex Incidence A study of the age incidence in the cases of acute appendicitis (Chart I) only verifies the already abundant evidence that the disease is primarily one of youth and young-adulthood, sixty-five per cent of the total cases occurring in the second and third decades of life The youngest patient encountered was six weeks old, the oldest eighty-three years

The incidence of acute appendicitis according to sex has shown only a slight predominance of males over females (52-48), although for children of twelve years or younger, the ratio was sixty-forty respectively Most surveys give a higher percentage of males

Etiology and pathology The etiology of appendicitis is not always evident even after careful consideration of the history and the pathological appearance of the appendix But there are two features of

erative wound healed perfectly Two other cases came to the hospital with appendiceal abscesses unaware that they also had tuberculosis of the lungs and intestines

In each instance the abscess was drained without attempting to remove the appendix, but a fecal fistula persisted After three and four months the tuberculous appendices were removed and the wounds drained, in one the wound healed promptly while in the other a fistula persists after six months

Carcinoid of the appendix was found three times in the 1,500 cases In two cases the patients were operated upon for mild recurring attacks of appendicitis persisting over periods of three and twelve months The third case had had several mild attacks during the six months preceding admission, but came to the hospital with a severe attack of eighteen hours duration At operation an enlarged, tough, gangrenous appendix was found Adenocarcinoma of the cecum invading the base of the appendix and producing acute appendicitis was encountered once

It appears likely, therefore, that an appendix chronically diseased with tuberculosis, carcinoid or carcinoma may be predisposed to a superimposed acute inflammation and gangrene Actinomycosis and amebic dysentery of the appendix probably also belong in this class, although there are no instances of these in this series of acute appendicitis In the group classed as chronic appendicitis, a cicatrized appendix was removed in a case known to have amebic dysentery

Previous attacks Sixty-four per cent of those with acute appendicitis came to the hospital in their first attack This is a better record than most other statistics show and is twenty per cent better than the figure quoted for New York City as a whole, suggesting that the public from which this hospital draws its patients, is more "appendix minded" The figures indicate that the appendix is more likely to perforate during the first attack than at any subsequent one, seventy-five per cent of the cases with perforation as compared to fifty-seven per cent of those without perforation had never had a previous attack

Catharsis Much stress has been laid on the important relationship of catharsis to the course of acute appendicitis There are some who feel that too much emphasis has been placed upon its influence, but there is no doubt of the frequently dire effects of purging Twenty-six per cent of acute cases in this study had had laxatives or cathartics of one type or another They had been used in nineteen per cent of the cases with acute unperforated appendicitis, in 43 5 per cent of those perforated with local abscess formation, and in 61 5 per cent of those perforated with spreading peritonitis That purging has a part in the advance of the disease is obvious There is nothing to show that enemas have had any comparable effect although there is good reason to believe that large, high-pressure enemas may be dangerous

Duration before admission The importance of the time element is axiomatic The average elapsed time between the onset of the disease and hospital admission was 2 6 days for all acute cases 64 7 per cent of the cases came during the first forty-eight hours Chart III shows the percentage of cases based upon this elapsed time In acute appendicitis without perforation, the average elapsed time was two days, the extremes being four hours and twelve days, in the group with perforation and abscess the average was 5 5 days, the extremes being fifteen hours and seven days, in the group with perforation and spreading peritonitis the average was 2 4 days, the extremes being ten hours and seven days In so much as it is the policy at this hospital to proceed with operation as quickly as possible, there was little additional elapsed time after admission and before operation

The foregoing figures when compared with the usual ones quoted, show that patients with appendicitis have come to this hospital more frequently in their first attack, have been less prone to take cathartics, and have allowed less time to elapse between onset of symptoms and hospital admission These are all-important factors and no doubt contribute to the comparatively low mortality in this series of cases

As the general public and that portion of the medical profession who take chances with delayed or conservative treatment become sufficiently aware of the importance of these three items, the prob-

cases in which a differential leukocyte count was done

Trauma as an occasional etiological factor has some evidence in its favor Theoretically and experimentally, the distention of the appendix resulting from sudden increase in intraintestinal tension may rupture the mucosa and induce infection in its wall Also, local laceration might conceivably be produced in thin individuals by forcibly compressing the appendix against the iliac bone In three cases, trauma appeared to play an etiological rôle One, an auto mechanic, experienced increasing pain in the right flank immediately after lifting the rear end of a light car A few hours later, at the hospital, he was thought to have sustained a muscle strain, a hernia in Petit's triangle, or possibly a retroperitoneal hematoma Three days later he was found at operation to have a retrocecal abscess from appendicitis with perforation The other two cases were in children—one was forcibly kicked, the other butted in the abdomen Both developed immediate pain and tenderness in the abdomen with nausea and vomiting In one, a gangrenous appendix was found after eighteen hours, and in the other, a perforated one after thirty-six hours

The one instance in which an acute appendicitis was found in a hernial sac occurred in the youngest patient, a baby six weeks old with an inguinal hernia In this case, the appendix was markedly inflamed and showed early gangrene, apparently as a result of strangulation of the blood supply The incidence of kinking and of cicatricial obstruction of the lumen has not been studied in this series, such a study would offer obvious difficulties

The seasonal variation and "epidemics" of appendicitis as well as its frequent association with upper respiratory infection, appear to have some etiological significance [4] Attention has been rather convincingly drawn to this relationship by some authors, but others strongly deny its existence Fifteen per cent of the cases of acute appendicitis in this series were preceded by and associated with acute upper respiratory infection Chart II shows a graph of all the cases of acute appendicitis for each month of the year over a four year period, also, a graph of the cases exclusive of those found to be definitely associated with upper respiratory infection For all cases there is a distinct increase in spring and fall months which cannot be entirely explained by the seasonal fluctuations in the number of hospital admissions While patients are less likely to have elective operations performed during the midwinter and mid summer months, this hardly applies to acute appendicitis The discrepancy between the two graph lines of Chart II shows that during the epidemic periods of acute appendicitis, there is a greater incidence of associated upper respiratory infections, and the inference is that there is a causal relationship

Whether infection beginning in the upper respiratory passages reaches the appendix by way of the blood stream or the enteric canal is not clear Also, it cannot be said with any degree of certainty that the initial swelling in the wall of the appendix always obstructs the lumen and that thereafter the process advances just as it does in cases of mechanical obstruction of the lumen In some instances the appendices of this group were found to be inflamed only in a distal segment, as in cases of obstruction of the lumen with fecaliths or strictures But in an impressive number of others, the entire mucosal lining of an unobstructed appendix was involved in an acute catarrhal process

Tuberculosis of the appendix with a superimposed acute inflammation was encountered in four cases One case was that of a young man with the usual symptoms and signs of acute appendicitis of thirty-six hours duration (first attack) The appendix at operation was thickened, inflamed, and covered with fibrin, and there was no gross evidence of disease in the adjoining ileum or cecum After the appendix was examined and found to contain small caseous tubercles, a chest x-ray revealed early active pulmonary tuberculosis, but further studies showed no evidence of the disease in the gastrointestinal tract At the end of a year and a half, he is well and considered to be an arrested case of tuberculosis Another case was that of a patient in the hospital ward with tuberculosis of the cecum who acutely developed new symptoms and signs which were interpreted after three days to represent appendicitis At operation a large gangrenous and tuberculous appendix was removed, the undrained op-

erative wound healed perfectly Two other cases came to the hospital with appendiceal abscesses unaware that they also had tuberculosis of the lungs and intestines

In each instance the abscess was drained without attempting to remove the appendix, but a fecal fistula persisted After three and four months the tuberculous appendices were removed and the wounds drained, in one the wound healed promptly while in the other a fistula persists after six months

Carcinoid of the appendix was found three times in the 1,500 cases In two cases the patients were operated upon for mild recurring attacks of appendicitis persisting over periods of three and twelve months The third case had had several mild attacks during the six months preceding admission, but came to the hospital with a severe attack of eighteen hours duration At operation an enlarged, tough, gangrenous appendix was found Adenocarcinoma of the cecum invading the base of the appendix and producing acute appendicitis was encountered once

The one instance in which an acute appendicitis was found in a hernial sac occurred in the youngest patient, a baby six weeks old with an inguinal hernia In this case, the appendix was markedly inflamed and showed early gangrene, apparently as a result of strangulation of the blood supply The incidence of kinking and of cicatricial obstruction of the lumen has not been studied in this series, such a study would offer obvious difficulties

The seasonal variation and "epidemics" of appendicitis as well as its frequent association with upper respiratory infection, appear to have some etiological significance[4] Attention has been rather convincingly drawn to this relationship by some authors, but others strongly deny its existence Fifteen per cent of the cases of acute appendicitis in this series were preceded by and associated with acute upper respiratory infection Chart II shows a graph of all the cases of acute appendicitis for each month of the year over a four year period, also, a graph of the cases exclusive of those found to be definitely associated with upper respiratory infection For all cases there is a distinct increase in spring and fall months which cannot be entirely explained by the seasonal fluctuations in the number of hospital admissions While patients are less likely to have elective operations performed during the midwinter and mid summer months, this hardly applies to acute appendicitis The discrepancy between the two graph lines of Chart II shows that during the epidemic periods of acute appendicitis, there is a greater incidence of associated upper respiratory infections, and the inference is that there is a causal relationship

Whether infection beginning in the upper respiratory passages reaches the appendix by way of the blood stream or the enteric canal is not clear Also, it cannot be said with any degree of certainty that the initial swelling in the wall of the appendix always obstructs the lumen and that thereafter the process advances just as it does in cases of mechanical obstruction of the lumen In some instances the appendices of this group were found to be inflamed only in a distal segment, as in cases of obstruction of the lumen with fecaliths or strictures But in an impressive number of others, the entire mucosal lining of an unobstructed appendix was involved in an acute catarrhal process

Tuberculosis of the appendix with a superimposed acute inflammation was encountered in four cases One case was that of a young man with the usual symptoms and signs of acute appendicitis of thirty-six hours duration (first attack) The appendix at operation was thickened, inflamed, and covered with fibrin, and there was no gross evidence of disease in the adjoining ileum or cecum After the appendix was examined and found to contain small caseous tubercles, a chest x-ray revealed early active pulmonary tuberculosis, but further studies showed no evidence of the disease in the gastrointestinal tract At the end of a year and a half, he is well and considered to be an arrested case of tuberculosis Another case was that of a patient in the hospital ward with tuberculosis of the cecum who acutely developed new symptoms and signs which were interpreted after three days to represent appendicitis At operation a large gangrenous and tuberculous appendix was removed, the undrained op-

clinical picture was discovered to be something else (Table III) *

These cases of mistaken diagnosis make an interesting study although only a limited knowledge may be gained in avoiding such mistakes in the future Indeed, the great danger may be that in the zeal to reduce this group, the surgeon may err on the wrong side, and find out too late that, in trying to avoid a needless operation, he has cost the patient his life

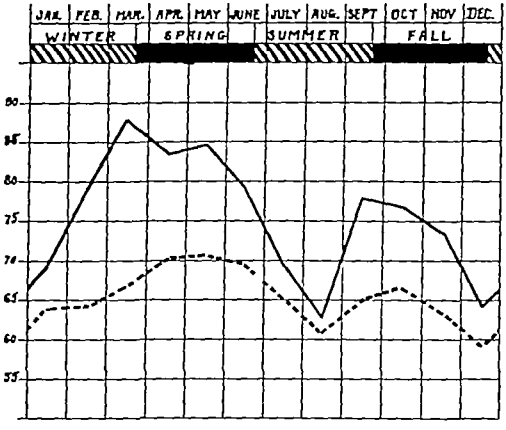
Salpingitis was operated upon 22 times for acute appendicitis The number of cases of salpingitis that were not operated upon over the same period of time is not known, though, no doubt, the number would be many times greater than the figure above The fact is frequently overlooked that the symptoms and signs of actual acute appendicitis may accompany salpingitis, albeit the process is a peri-appendicitis which presumably never goes beyond this stage. None of the cases of acute salpingitis have appeared the worse for a simple exploratory operation with appendectomy However, two cases were treated conservatively as salpingitis for four days when it became evident that there was a general peritonitis from perforated appendicitis, the operations performed on these two patients in the late stages of their disease were useless

Acute lymphadenitis of the mesentery of the small intestine was found in twenty-one cases to have been mistaken for acute appendicitis This disease has had little recognition until recent times [5] Formerly, it was taught, particularly in pediatric textbooks, that lymphadenitis of the mesentery was caused by tuberculosis, but tubercle bacilli are rarely, if ever, found in this acute disease of the lymph nodes seen at the operating table There is often, although not always, a concurrent upper respiratory infection, suggesting an etiological relationship

In this series, mesenteric adenitis occurred in patients between the ages of four and twenty years, the average age being thirteen The symptoms and signs, although usually not typical of appendicitis, were not different enough from those of appendicitis to make a differential diagnosis possible At operation, acutely inflamed lymph nodes were found varying in diameter from one-half to three or four centimeters, and in number, from a few localized in the lower ileal mesentery to many involving the entire mesentery of the small bowel Some of the nodes were removed and microscopic study showed merely lymphoid hyperplasia Frequently there was an excess of clear peritoneal fluid, occasionally moderate thickening of the mesentery, and rarely, slight edema of the adjacent bowel The appendix never appeared unusual It has been suggested that appendicitis may be an etiological factor and that appendectomy is advisable, but this is doubtful because the disease has occurred in individuals whose appendices have been removed, moreover, it is often observed that even in the presence of gangrenous appendicitis, the nodes in the immediate ileocecal region are not enlarged All of the cases of this group recovered during the week's stay in bed after operation, none were made worse by operation Follow-up studies show that seventy-five per cent of them have had recurring attacks

TABLE III

127 CASES OPERATED ON AS ACUTE APPENDICITIS BY MISTAKE



Acute salpingitis	22	Free fluid in abd. (Cause unknown)	2
Pyelitis	4	Food poisoning	3
Nephrolithiasis	3	Alcoholic enteritis	1
Perinephric abscess	1	Mesenteric Infarct	1
Hydronephrosis	1	Pneumonococcus Peritonitis.	2

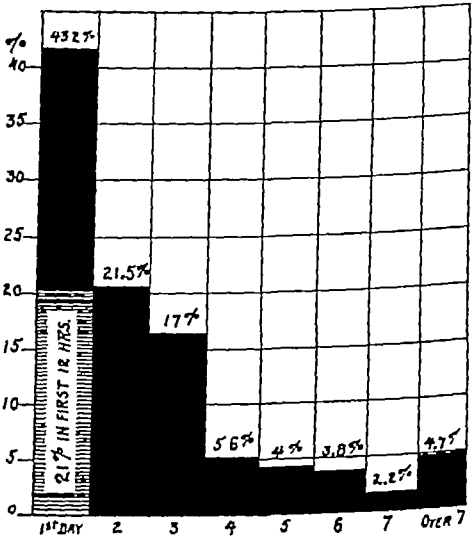
CHART II

(Solid line) All acute cases by the month (four year period)
(Dotted line) Acute cases exclusive of those with upper respiratory infections.

lem of dealing with appendicitis will be simplified



Clinical manifestations Given a case with the classical symptoms and signs of acute appendicitis, the diagnosis is not difficult but in only forty-five per cent of the cases can they be said to have been typical Abdominal pain of some kind is always present but its location and nature varies greatly and in young children it may be poorly expressed Associated nausea and vomiting is too variable to be of constant value Diarrhea, considered to accompany diseases other than acute appendicitis, and to serve as a differential point, was found to occur in eight per cent of cases of appendicitis Similarly, urinary symptoms such as frequency, discomfort on voiding, and even cells in the urine, which are usually relied upon to differentiate appendicitis from urinary tract disease, were found to be present in seven per cent of all cases of acute appendicitis, and occurred as frequently as twenty-five per cent in the group with spreading peritonitis

Local tenderness over the appendix comes nearest to being a constant finding in all cases, but all too frequently, even this is a matter of interpretation, especially when dealing with a child or an uncooperative patient The interpretation of other physical findings as muscle spasm, rebound tenderness, and special signs, vary in the same patient with different examiners Tenderness on rectal examination was recorded by able examiners in sixty per cent of the cases, but its importance as a sign of acute appendicitis must be looked upon guardedly

Temperature, pulse rate, and leukocytosis are of limited help in differentiating appendicitis from other diseases and in differentiating one stage of the disease from another Table II demonstrates that while there may be significant differences in the averages, the extremes overlap greatly

Differential diagnosis and the common mistakes In a disease in which early diagnosis and early operation are so necessary, the differentiation from other diseases takes on increased significance The surgeon is certainly not justified in operating indiscriminately on every case with abdominal pain and tenderness, and a multitude of conditions may simulate wholly or in part the features of appendicitis Time and special tests would rule out most of these cases but such measures may be endangering the patient's life and the increasing mortality of delay must be weighed against the low mortality of operating needlessly In this hospital, certainly ordinary judgment has been used in diagnosis and always a minimum of three examiners has observed the patient prior to operation Yet in 127 cases, the appendix which was removed, was found not to be inflamed and the cause of the

CHART III—PERCENTAGE OF ACUTE CASES BASED ON TIME ELAPSED BETWEEN ONSET OF SYMPTOMS AND ADMISSION TO HOSPITAL

five incorrect Three of those in the first trimester, none of those in the second, both of those in the third were mistaken for appendicitis The harm in removing the appendix appears negligible, for in only one instance was gestation interrupted, one woman at eight months, delivered a living child two days after operation Of course, fifty per cent mistaken diagnosis is high and even a simple appendectomy during pregnancy is not to be taken lightly But the penalty of letting an acute appendicitis go undiagnosed or untreated may be general peritonitis which the pregnant woman may be unable to cope with, to say nothing of the additional complications of a dead fetus

Operative data In the New York Hospital, appendicitis is a condition largely handled by the house staff working under the resident system Of the 1,500 operations, eighty-five per cent were done by the house staff, and fifteen per cent by the professioral staff By this system almost everyone thinks and acts along similar lines, so that even though fifty surgeons performed 1,500 operations, there was little variation in methods Five surgeons did over one hundred operations apiece, and thirty-five did less than twenty-five apiece.

In all types of acute appendicitis, the rule was to operate without delay when the diagnosis had been made, and often it was thought better to operate in the absence of a positive diagnosis than to await a more definite one The incision of choice was predominantly the McBurney—in ninety-four per cent of cases with acute appendicitis, and in seventy-two per cent of the nonacute This incision has not only been entirely adequate for dealing with all types of acute appendicitis, but it has had distinct advantages over the other abdominal incisions The most important advantage is that in the presence of pus, the appendix can be removed without handling other parts of the bowel and spreading infection Additional advantages are those of easy drainage, fewer wound complications, and shorter convalescence. In a few cases, such as perforated ulcer and acute cholecystitis, mistaken for appendicitis, it was necessary to close the McBurney incision and make another, there need be no embarrassment about such a procedure On the other hand, on three occasions a perforated appendicitis was found when a right rectus exploratory incision had been made, each time the wound was immediately closed, and through a McBurney incision, the appendix was removed and drained

The anesthesia most frequently used for the 1,500 cases was ethylene, supplemented with a small amount of ether (1165 cases) In children and cardiac cases principally, open mask ether was used (265 cases) Spinal or local anesthesia was used in the remainder Appendectomy under local anesthesia was usually an unpleasant experience for the patient Spinal anesthesia was used in some cases of spreading peritonitis because it was felt the patient's general condition did not warrant inhalation anesthesia But more often than not, it was just such a patient that had to be put in Trendelenburg position because of drop in blood pressure, and this is a decidedly unfavorable position when pus is free in the abdomen

Appendectomy with some appropriate method for inverting the stump was employed wherever possible, although care was taken not to do this at the expense of undue manipulation in the presence of pus In twenty-two per cent of cases of perforation with abscess formation, and in only five per cent of those with spreading peritonitis, drainage without appendectomy was employed In three of the former, the appendix was removed before the patients left the hospital because of recurring pain and fever All were advised on leaving the hospital to return in six months for appendectomy, and to date seventy per cent of them have done so

All cases of perforated appendicitis, of course, were drained without question, but frequently there was indecision about drainage in that group in which a gangrenous but grossly unperforated appendix was accompanied by an excess of cloudy peritoneal fluid One fourth of the cases without perforation were in this group, and the old axiom "drain when in doubt" was usually adhered to Thus, twenty per cent of these cases were drained Aerobic and anaerobic cultures of the abdominal fluid showed a positive growth in fourteen per cent of cases, the organisms being B coli, streptococci or gram negative bacilli The fluid from a num-

There were also fifteen cases operated upon for acute appendicitis whose symptoms and signs were found to be due to acute upper respiratory disease with gastroenteritis, popularly known as "intestinal flu" In these cases there was no mesenteric adenitis The various clinical pictures of disease beginning as throat infections have been a great source of worry, all the more so because acute appendicitis may be one of the complications of such infections In 1921 Brenneman drew attention to the misleading nature of abdominal pain seen in children with throat infections In 1927,[6] to make amends for the misinterpretation many put on this paper, he wrote a second paper in which he states "A simultaneous throat infection should make one incline toward rather than away from the diagnosis of appendicitis"

Four cases of so-called regional ileitis, all that have been encountered at this hospital, were operated upon with the diagnosis of appendicitis A large percentage of the reported cases of this condition have been mistaken preoperatively for appendicitis This is a disease entity which, as the name implies, is characterized by inflammation of the ileum, usually in its terminal six to twelve inches All four cases had right lower abdominal pain with nausea, vomiting, moderate fever, leukocytosis, and local tenderness, three previously had had similar attacks In two of the cases a mass, which preoperatively was thought to be an appendiceal abscess, represented the thickened bowel A correct diagnosis could possibly have been made by proper x-ray examination, but such a procedure might be dangerous should one find he were dealing with appendicitis

The etiology of regional ileitis is apparently unrelated to appendicitis and little is actually known of its origin The occasional edema of the bowel seen with acute mesenteric adenitis, however, suggests an early stage of this condition The three stages of the disease usually cited are the inflammatory, the obstructive, and the fistulous Resection has been recommended without qualification by some, but this attitude can be disputed Without further operation, two of these four cases are free of symptoms after eighteen and thirty-six months respectively One of the others, a negro child, was found to have a fistula between the indurated ileum and the tip of the appendix Appendectomy was performed and the defect in the ileum closed He has continued to have intermittent symptoms, and x-ray examination after three years shows the typical string-like narrowing of the distal ileum, but the child's general health has been fairly satisfactory The fourth case, after appendectomy, continued with symptoms for six months when a resection of the ileum with ileocolostomy was done, six months after this, there was evidence of complete recovery

Ruptured ovarian follicle is another entity that gives a clinical picture simulating appendicitis In the eleven cases that were operated upon, the attacks came somewhere between the tenth and fifteenth day after the onset of the last menstrual period—in other words, in the midmenstrual cycle There was always some degree of bleeding into the peritoneal cavity In seven instances, the right, and in four, the left ovary was found to contain a hemorrhagic cyst of from one to four cm in size It is interesting that even though the pathology arose from the left side, the predominance of pain and tenderness was always on the right Five of these cysts were observed at operation to be actively bleeding Microscopical examination of the three that were removed showed cysts lined by degenerating lutein cells Nothing is known of the cause for this abnormal state of the Graafian follicle, and follow-up studies show that better than half of these patients have no recurrence of the attacks

Appendicitis complicating pregnancy is a dreaded combination There is no reason to believe that appendicitis is any more frequent during pregnancy, but it may be more difficult to recognize, and it certainly is more dangerous for both mother and fetus, particularly in the last half of pregnancy The abdominal pains, gastrointestinal symptoms, the slight abdominal tenderness, even the leukocytosis of pregnancy may closely simulate acute appendicitis In the total of 1,500 cases, ten pregnant women were operated upon with a preoperative diagnosis of acute appendicitis There were four in each of the first two trimesters and two in the last In five cases the diagnosis was correct and

failed to wall off as a local abscess Mortality in this group is usually considered to be between twenty and forty per cent, here it was twenty per cent No cases of perforated appendicitis went unoperated during the period covered by this study, either on the surgical wards or on the associated wards for which the surgical department acted as consultant

The attempt to lower this mortality by adopting a conservative and waiting policy in the cases of advanced peritonitis has not been used in this hospital because the arguments for such a practice are not enbund stage of general peritonitis Such cases leave a vivid impression

Table IV shows the important facts about the nineteen patients who died as a result of acute appendicitis The mortality was greatest at the extremes of life (Chart IV) Fortunately at the ages when the greatest incidence of appendicitis occurs, the lowest mortality exists The apparent reasons for the higher mortality in the younger and older are with the child there is apt to be more delay in coming to the hospital, purging is more usual, and the child's peritoneum with-

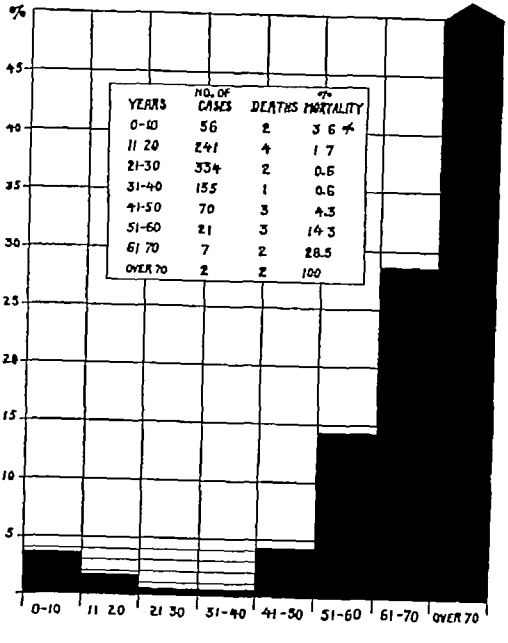
tirely convincing Furthermore, the criteria for discerning those cases that deserve immediate operation from those that do not, are by no means clear In view of the uncertainties in discerning the stages of acute appendicitis, even the ablest diagnostician may mistake an early case of peritonitis, which might readily recover from operation, for a more advanced one which has a grave prognosis with or without operation The two cases of appendicitis, with peritonitis, mistaken for salpingitis on the third day of their illness and treated with rigid conservatism, went on in the next four days to a moristands infection less well, with the adult past forty, symptoms are less typical and complications more frequent



To summarize the factors influencing the mortality in acute appendicitis, the important ones are age, duration of disease before operation, catharsis, anesthesia, type of incision, operative skill, postoperative care, and general resistance of the patient

Hospital days The average time spent in the hospital in cases with acute unperforated appendicitis was 8 8 days, fifty per cent were discharged in seven days or less From the standpoint of the economy

ber of the undrained cases showed organisms on culture, yet no subsequent peritonitis developed This suggests that probably drainage is entirely unnecessary when the appendix has not perforated However, wound infection was noticeably more frequent in such cases (15 per cent), whereas in all undrained cases, its occurrence was 3 9 per cent The incidence of wound infection in the nonacute cases was 0 8 per cent

Complications The other important complications after operation for appendicitis occurred principally in those cases

CHART IV—PERCENTAGE MORTALITY ACCORDING TO AGE

with perforation and in those with some chronic systemic disease accompanying appendicitis Many of the serious complications here listed were the cause of death

The abdominal complications include pelvic abscess, fourteen cases, fecal fistula, eleven (all but one closed spontaneously), paralytic ileus, seven, intestinal obstruction, two, evisceration, one (following accidental removal of drain on first postoperative day), acute cholecystitis, one, and pylephlebitis with multiple liver abscesses, one Ileus and intestinal obstruction caused most concern and all but two of the patients with these complications died Paralytic ileus is present to a moderate degree at the outset in all cases of peritonitis, but in the early stages may be amenable to treatment Therefore, every case was treated with this in mind, using a regime of nothing by mouth, large amounts of fluid parenterally, abdominal stupes and poultices, repeated blood transfusion, and most important of all, early and constant duodenal drainage No form of enterostomy was performed until it became established that the condition was progressing under conservative treatment Jejunostomy was utilized in seven cases and in no instance did it save life

It could be argued that earlier jejunostomy in these cases might have been more efficacious, but this reasoning is doubtful

The pulmonary complications include bronchopneumonia, twelve cases, atelectasis, five, pulmonary embolism, six The cardiovascular complications include cardiac decompensation, three cases, thrombosis of pulmonary artery, two, septicemia, three, phlebitis of lower extremities, eight Of urinary tract complications, cystitis occurred fifteen times, and pyelitis twice Serious parotitis developed in three cases, two of which died In one case of gangrenous appendicitis with cloudy peritoneal fluid, undrained, a severe streptococcal phagedenic infection developed which involved the entire right abdominal wall extending to the back and lower thorax, the patient recovered

With regard to incisional hernias in wounds that had been drained, follow-up studies of a year or more showed that twenty-two per cent of the McBurney wounds developed hernias (There were none in undrained wounds) There were eight cases in which drainage was done through a right rectus incision and half of these developed hernias The incisional hernias through paramedian wounds can be notoriously bad, but hernias in McBurney wounds are small, and many patients refuse repair However, half of them have submitted to operation, and repair has always been simple

Mortality The mortality figures (Table I) indicate essentially what all statistics on appendicitis do, namely, that the gravest danger to life exists when the appendix has perforated and the infection has

noticed particularly after a meal Gas and constipation are frequently accompanying complaints There may be tenderness over the appendix but its elicitation, even with the aid of the x-ray to locate the exact site of the appendix, cannot always be depended upon to be definite evidence of chronic appendicitis

There can be little doubt that there does exist a variable syndrome caused by chronic disease of the appendix, but the difficulty lies in making a correct diagnosis preoperatively even though careful studies be made to rule out the many other possibilities Often when the diagnosis is particularly elusive, it has seemed almost better from the standpoint of conservation of time and money to rely on operation to settle the question though such a policy has a limited application

Operative data The McBurney incision was used in seventy-two per cent of cases because the wound is less disabling and convalescence is quicker The right rectus incision was used when there was just reason to suppose there might be pathology that could not be reached through a McBurney incision Whereas catgut sutures were used in most cases of acute appendicitis, silk was used in ninety per cent of the nonacute cases and the incidence of wound infection in the latter was 0 8 per cent There were no serious complications and no mortality in the 487 patients operated upon for chronic appendicitis

Follow-up studies The final proof of the value of appendectomy in chronic appendicitis lies in alleviation of symptoms Of the cases operated upon sufficiently long ago for study, eight-nine per cent (345 cases) have had careful follow-up studies over a period of one to three years The results of the study (Table V) show that 64 6 per cent have been entirely relieved of symptoms It is likely that some of these cases represent psychotherapeutic successes only, but regardless of how or why, if almost two-thirds get relief of symptoms, the operation has been justified Table V also shows an analysis of those cases that had no benefit from appendectomy, a few of the diagnoses that appear there were made preoperatively, but in every case there seemed good reason for the operation at the time

ELECTRICAL HEARING AIDS IN A SCHOOL FOR THE DEAF

Lord Horder inaugurated a special sound installation at the cinema of the Royal School for Deaf and Dumb Children, Margate. Experiments in the use of electrical hearing aids have been carried out during the past three years at the school, which is now the first to be equipped with apparatus that enables a fair proportion of its pupils to distinguish the sounds reproduced in a talking film As told in the London letter to the *AMA Journal,* a record is made, by means of tests on an audiometer, of the exact amount of hearing loss of each child It has been found that those who do not have a greater hearing loss than seventy per cent can derive benefit from hearing aids

The sound reproduced with the film is put on to a line through a special device which ensures that it shall not exceed a certain level of volume The line goes to sockets fixed on the back of each chair, and each child has a small box from which a lead is plugged into the socket. The special "unmasked hearing" headphones which the child uses ensure that the speed sounds are clearly defined, so that the consonants in particular are easily distinguished The system of "unmasked hearing" is regarded as the most important feature of the installation, because its use helps in a progressive appreciation of speech sounds

Lord Horder said that the school made a double appeal to the physician—as a humanitarian and as a scientist These hearing aids achieved what was a valuable addition to the physical and mental well-being of the children of the school

New medicines and treatments are like Messiahs, which mankind yearningly longs for Too often they are false Messiahs — *Getterman*

of time and money, to say nothing of safety, there can be no advantage in "freezing out" acute appendicitis which will probably recur and eventually require surgery

Chronic Appendicitis

Among the 1500 operations for removal of the appendix, 487 were done for chronic or recurrent appendicitis Chronic appendicitis is a diagnosis for which the surgeon feels a certain amount of apology because it is a clinical diagnosis without a definite pathological picture The diagnosis of recurrent appendicitis implies repeated acute attacks on a definite pathological basis But no sharp line of distinction can be drawn between the two changes in the nervous tissue of the appendix Since Masson[7] in 1921 drew attention to sympathetic neuromas and the "musculo-nervous hyperplasia" of the appendix, the hope has been that here was more definite evidence for diagnosing chronic disease of the appendix and a more tangible cause for the symptoms of chronic appendicitis The impression gained in this hospital, however, has been that hyperplasia of nervous tissue has no more significance than other changes in the appendix and that actual neuromas are comparatively rare

Localized strictures or gross kinks were present in twenty-one per cent, and fecaliths were found in the lumen in nine per cent of the cases *Intestinal worms in the* lumen occurred in seven cases, carcinoid

even though theoretically there may be very different reasons for operation

Pathology Almost every appendix removed showed on gross or microscopical examination some variation from normal, such as periappendiceal adhesions, kinking, narrowing or obliteration of the lumen, cicatricial stricture, atrophy of the mucosal layer, hypo- or hyperplasia of lymphoid tissue, proliferation of connective tissue in one or more layers, or alteration in the nervous tissue Such changes can be the result of inflammation though some may represent an involutional process The mere fact that the same changes are often found in appendices removed incidentally, implies that they need not always be the cause of symptoms

Considerable attention was given to the occurred twice, mucocele, four times, and tuberculosis of the appendix, once The appendices removed in the twelve cases that returned for elective operation after drainage of an appendiceal abscess showed, for the most part, no changes that might definitely distinguish them from other appendices about which there was no such definite history In other words, there was no dependable correlation between the pathological picture and the nature of the clinical symptoms and signs

Clinical manifestations The symptoms usually ascribed to chronic appendicitis are either pain and soreness in the right lower quadrant of the abdomen or a digestive discomfort referred to the epigastric and umbilical regions The latter are

tions of diet were adhered to for a long period When Greece was conquered by the Romans, the superstitious barbarisms existing in Rome before the conquest were quickly abolished through the influence of Greek civilization, public baths were established, and gymnasiums and places for social entertainment organized, mineral waters and hot springs became extremely popular Furthermore, these innovations were not confined to Rome, but were to be found in all parts of the world where Roman conquest followed Arabian medicine, bridging the gap between the Greco-Roman and Renaissance periods, was inclined more toward drug therapy rather than physical measures, while during the Dark Ages, with the degradation in all arts of life during that period, medical as well as physical therapy fell entirely into disrepute, since solicitude concerning the body was regarded as degrading During the later centuries—the fifteenth, sixteenth, seventeenth and eighteenth—there were periods of popularity and periods of decadence in physical therapy, there were times when public baths were closed altogether because the spread of syphilis in Europe during those periods was ascribed thereto In Germany, however, since the seventeenth century, hydrotherapy has received better consideration, it being really from here that the value of various mineral waters in the treatment of chronic diseases has spread throughout Europe

In this country, as mentioned, physiotherapy was utilized but little before the war, there was no real interest by the general profession in this type of treatment The late War, however, provided an opportunity for an immense and illuminating demonstration of what physiotherapy may accomplish The vast number of wounded coming back from the other continents, the wish to return the disabled to their homes restored in function at the earliest possibility, the unstinted resources of the government to provide for their treatment, as well as the knowledge acquired abroad by our physicians regarding methods to be employed and results obtainable—all these have stimulated a general interest in physiotherapy Surgery, especially traumatic, has benefited mostly from its advancement But ere long, the internist also turned his attention to this new therapeutic field with the result that today it constitutes a very important part in the therapeutic armamentarium of the practising internist

Circulatory Disorders

After this short introduction permit me now to present briefly a few of the more common uses of physical therapy in internal medicine, lack of time compels the elimination of symptomatologic and other data of interest in the disorders to be mentioned, or the quoting of statistics of personal experiences

The application of physical therapy in cardiovascular disease is for the purpose of alleviating pain, relieving vascular spasm, correcting functional disorders, and influencing the state of the coronary vessels We feel it is particularly helpful in *chronic angina pectoris,* especially of the milder or moderately severe types Here diathermia is the most popular modality, as it serves as a means of inducing local hyperemia, improving muscle tone, effecting dilatation, and relieving spasm of the coronary blood vessels, it increases the pulse rate and quality and favors stronger cardiac action

Diathermia is also being employed in the treatment of *chronic coronary thrombosis,* in the acute and subacute cases such therapy is generally harmful Marked clinical improvement with relief of symptoms may here be obtained because of increased flow of blood in the myocardium and decreased anoxemia, there often occurs also a change in the abnormal deflections of the T wave in the electrocardiogram In instances where the cardiac disorder is associated with a neurotic state, a not uncommon occurrence, the treatment is particularly helpful because of the additional psychic effect

In both conditions—angina pectoris as well as coronary thrombosis—treatments comprising a constant current of about 800 to 1200 ma for one quarter to one hour's duration, should be given regularly for many months, two or three times a week The technic employed may be the usual—medium-sized electrodes applied precordially and posteriorly, the patient generally in a sitting or at times a lying position During the past two years we

THE RELATIONSHIP OF PHYSICAL THERAPY TO INTERNAL MEDICINE

JACOB GUTMAN, M D, PHAR. D, F A C P, *Brooklyn*
Director, Brooklyn Diagnostic Institute

The subject assigned to the speaker is indeed very extensive in its scope We feel that in the short time allotted it will be impossible to do it justice, therefore, but few of its more important topics can receive consideration. We are offering this presentation not as a specialist in physical therapy, but as an internist, who over twenty-five years ago visualized the value of physical therapy in the treatment of medical disorders, and who during all this long period made use of all the modalities offered by a well-equipped physiotherapy department and the opportunities of an extensive practice

Only during the last two decades has physical therapy really made definite progress in this country, previously, but little was known of its various modalities or their effects Since the last War, because of extensive researches conducted in every part of the country and systematic accurate clinical observations afforded each modality, physical therapy has become recognized as an important factor in the treatment of disease Today, many institutions throughout the land boast of excellently equipped physical therapy departments, many men have become proficient specialists in this branch of therapeusis, and almost every practising physician is in possession of some type of equipment for its application in the treatment of disease Such popularity is accounted for by the fact that physical therapy offers certain advantages not obtainable with other types of treatment, it makes it possible to directly affect topically almost every organ in the body, in numerous instances it gives almost immediate symptomatic relief, though not always of permanent duration, through its use, surgery may occasionally be avoided

Whether the action of the physical agencies be chemical, physical, biologic or physiologic—a question still debated regarding some modalities—we are not concerned here, we are interested only in their practical application

Physical therapy is not an innovation in medicine, being probably one of the oldest methods in healing the sick Neither is it confined to man only, lower animals, seeking relief from pain and sickness resort by natural intuition to heat, friction, cold, bathing, and similar methods Primitive man of the lowest known cultural level appreciated the value of heat and cold, crude massage, baths, mineral waters emetics, and purgatives which he utilized in bringing up his young, and in the development of his own body as well as in the treatment of his ailments At later periods, sorcerers, priests and professional wise men took up the healing of the sick and added to these simple natural remedies prayers, incantations, and ridiculous and repulsive substances, these were employed as supernatural agencies in conjunction with the superficial application of common remedies previously mentioned, religion being injected into the art of healing at every low cultural level Still later, as in Greece and then in Rome, many physical measures as bathing, gymnastics, diet, and massage were utilized in the healing of the sick, as well as for the development of sound, healthy bodies In Greece the numerous temples of Aesculapius were located in the sacred groves near mineral, thermal, and sea waters, and under the management of hereditary priests Hippocrates fully understood the value of fresh air, good food, proper rest, sleep, and exercise, also of the necessity for normal excretory practices, factors accepted today as indispensable in proper hygiene and promotion of good health The methods of administering cold water baths, massage, etc., were carried out by his disciples for many centuries thereafter, and his many regula-

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

demand very careful, judicious, and patient therapy

There seems to exist a difference of opinion among some clinicians as to the benefits to be derived in hypertension from physical therapy Where differences in results do occur, they are undoubtedly due either to faulty selection of cases or improper methods of application We found physical therapy far more helpful in hypertension due at least partly to vasomotor spasms than in those due entirely to actual pathologic changes in the artery, where loss of elasticity and deposits of lipoids and lime salts exist It is imperative in all cases before applying treatment, that particular attention be paid to the disclosure of every underlying etiological factor For this reason, various investigations are demanded, including inquiry into living conditions mental stress and aggravations and eating and sleeping habits, but special stress must be laid on the discovery and eradication of focal infection

To the colon we afford special attention, for we feel that in a majority of instances the bowel is an important contributory cause of hypertension Constipation seems common in these cases, and many products of fermentation and putrefaction resulting therefrom are very potent etiologic factors in hypertension The intestine is an excellent site for toxin formation, it contains numerous pathogenic and potentially-pathogenic bacteria, it presents a suitable culture medium of proper temperature and moisture with nutrient substances, as food residues, incompletely split proteins and other products—all favoring the growth of bacteria and the production of toxins The nitrogen types of putrefactive bacteria manufacture from the large complicated protein molecule many obnoxious substances, the aromatic ring is broken up into indol, skatol, cresol, and phenol, the fatty acid radicle into cadaverin, putrescin, ammonia, acetone etc , the sulphur radicle into sulphur derivatives as methyl mercaptan the carbohydrate part into muscarin, cholin, neurine, and others Many similarly toxic by-products are also derived from the decomposition of carbohydrates and fats Some of these substances are powerful vasoconstrictors and thus inducive of hypertension Of course, under normal conditions such amins and toxins reaching the portal circulation are destroyed in the liver, but in intestinal stasis accompanying dilatation, atonicity, displacement, kinking, and ileocecal incompetency or in inadequate liver function, the entrance of these substances into the general circulation results in disease, including arterial hypertension—sometimes transient, at other times permanent

It is for this reason that we stress upon eliminative treatment, particularly the cleansing of the colon Such procedure, if scientifically administered, followed where indicated by the injection of some antiseptic or astringent, or the implantation of acidophilus products, will remove disease-producing bacteria, potent toxins, and decomposing foods Besides diathermia to induce favorable congestive reaction and soften adhesions, galvanic sinusoidal or Morse wave current to stimulate tone, properly performed massage to correct displacement, ptosis and kinking of various segments of the gut are helpful in appropriate cases in obtaining normal intestinal function

To further promote elimination—particularly of uric acid—electric cabinet baths are used, the induced sweating by dehydration also helps the obese to reduce weight, a factor desirable in all hypertension cases, other measures, including Bergonie treatment, are applied to accomplish such reduction

In autocondensation we place great reliance in reducing hypertension, its effects of producing capillary dilatation and relaxing vessels, of increasing metabolism, inducing heat and sweating, is the basis of the rationale of its application It also stabilizes the sympathetic system with its effects on the secretory, peristaltic, and vasomotor activities Autocondensation therapy must be given for a prolonged period, progressive improvement occurring only when persistently followed up Occasionally it may be necessary to give a second and third course at given intervals We administer 500 to 1,000 ma for twenty to thirty minutes a few times a week, upon improvement the treatments are reduced Vibratory massage at second and third

have also been employing ultra short wave for cardiac disorders Although, in some instances the patient who has previously had diathermia expresses a preference for ultra short, claiming this to be more effective, either current may be tried in a particular case Such treatment, however, being mostly palliative, should constitute only a part of general therapy, an ally to drugs, diet, hygienic living, and other therapeutic measures known to influence and aid these conditions

We will not here dilate upon the uses of other physical measures of benefit in cardiac disease, e g, special exercises, mechanotherapy, massage and other modalities, or of carbon dioxide baths, so excellently provided and administered in our own State, as well as in others and in European countries, all known to be most beneficial in these disorders

The value of physical therapy in *vascular diseases of the extremities*, whether due to vasomotor disturbance or chronic progressive inflammation, is an accepted fact, here pain and spasm are relieved, active hyperemia is induced and symptoms improved In *thromboangiitis obliterans*, foot baths are ordered as a usual procedure, how much they improve circulation in the extremities has been to us a moot question Buerger's exercises to stimulate muscle tone and circulation we found valuable, ultraviolet and whirlpool baths may assist in the healing of ulceration, where present Diathermia is often employed by us and appears to relieve pain and assist in restoration of function, the ordinary cuff and plate electrodes are applied, administering about 500 to 1,000 ma as frequently as three times a week, best preceded by light therapy The results are often transient, yet we feel that in a limited number of our cases, amputations were definitely avoided thereby

Such course of therapy, however, is of very little benefit in the more advanced cases, here external local heat by whatever means applied seems most beneficial We have had as yet but little experience with suction and pressure apparatus and therefore refrain from passing an opinion Mecholyl iontophoresis, but recently introduced, seems to offer an additional means of relieving pain and discomfort

The physical treatment of vascular occlusion due to *endarteritis*, as in arteriosclerosis, diabetes, etc, is similar to that of Buerger's disease Intermittent claudication, usually of angiospastic origin, accompanying any of the vascular disorders of the extremities, may satisfactorily be overcome by similar treatment In our few cases of early Raynaud's disease, symptomatic relief was obtained with general ultraviolet radiation and diathermia of 200 to 300 ma. for about a half hour every day or second day followed by galvanism, with the affected extremity in a negative galvanic bath and the indifferent electrode posteriorly or at the cervical region for ten to twenty minutes, about twenty ma as recommended by Granger In the second and third stages of the disease, physiotherapy seems useless

Hypertension

Physical therapy is of considerable value in hypertension However, before one may rationally apply any of its modalities, it must first be determined whether the pressure is really abnormal in the particular case, being guided by definite standards as to what is normal or abnormal in each instance It must also be established whether the case is one of hyperpiesis or essential primary hypertension, possibly of toxic origin, or whether it is of the sclerotic type, accompanying arteriosclerosis, aorta disease or sclerosis of kidneys or other organs

In deciding on treatment, there are instances where a higher than expected blood pressure is suddenly discovered, perhaps during a life insurance examination, here, the individual may need no treatment, except perhaps reassurance, neither do transient cases due to mental strain or occurring at menopausal and menstrual periods, or in pseudoangina require treatment, some cases of hypertension failing to show an etiological factor and probably due to irritation of vasomotor center, also require but little attention On the other hand, any type of hypertension with even mild symptoms such as headaches, early fatigue, slight dyspnea, vertigo, perhaps palpitation, should be given the benefit of physiotherapy, those presenting more serious symptoms, as evidences of cardiac insufficiency, Bright's disease or perhaps hemorrhages, retinal changes, particularly

be taken that the abdominal walls are completely relaxed, the patient must also lie comfortably on a table of proper height for the attendant to be in a position to do the best work, the kind of massage and length of treatment is guided by the individual case Electrotherapy is then administered, the best current is the interrupted faradic or the Morse sinusoidal for slow stimulation, *rapid interruptions are not desirable* Such colon therapy is given two or three times weekly, daily if necessary, improvement occurs almost always after the first few treatments

In *spastic constipation,* all causes, direct or indirect, inducing reflex spasm, as chronic appendicitis, gall-bladder disease, *sometimes* gastric ulcer, rectal disease, and colitis must first be eliminated, this must be done, where possible, if treatment is to succeed A spastic anus, where present, must also be treated, applying relaxing currents or if necessary, manual dilatation, neurasthenics must be attended to accordingly Massage is not helpful in the spastic type, but heat in the form of hot Sitz baths and diathermia are more dependable

The results obtainable in the treatment of chronic constipation, whether atonic or hypertonic, are as a whole very satisfactory, and where no complications coexist, normal regular evacuations may be established in a comparatively short time One must, however, remove, as previously stated, all mechanical obstructions to the movement of bowel content, by replacing displaced colon segments into more normal positions, which may be accomplished by manual massage in proper directions, the logical means also of correcting angulations Localized adhesions, if not extensive, may best be treated by diathermia, extensive adhesions being beyond physical therapy, diathermia followed by proper massage will bring about softening and loosening or sufficient lessening of the adhesions to permit freer motion and better physiological function of adherent segments, as observed by us on many occasions In numerous disorders, as arthritis and cardiovascular disease, in which the colon is known to be an etiologic factor, attention must be given also to the competency of the ileocecal valve, for this muscle plays an important part in separating the clean, almost aseptic ileum from the contaminated, bacteria-loaded and toxin-harboring adjoining cecum and rest of colon Wherever ileocecal incompetency exists and a reflux of fecal content into the absorbing ileum may occur, the use of stimulating currents to improve the tone and function of valve musculature is obligatory

Regarding many other disorders of the gastrointestinal tract as pylorospasm, cardiospasm, gastric ulceration, chronic gall-bladder disease, ulcerative colitis, etc in which many physical therapy modalities constitute excellent aids in treatment, discussion must be omitted here for lack of time

Arthritis

One other disorder, however, because of its great interest to the medical practitioner, must be afforded consideration, namely, arthritis Physical therapy in the treatment of arthritis, is not only most helpful, but essential Arthritis constitutes an important factor in medicine and a problem that the profession must solve, it is one of the most troublesome affections of humanity, it disables annually about three per cent of the population of the United States, and constitutes one sixth of all disabilities, it cripples industries to the extent of hundreds of millions of dollars a year and causes a great amount of suffering Since the introduction of physical therapy, however, the outlook is much more optimistic, the treatment is helpful if in skilled hands We shall not engage here in discussions of classifications nor speak of the numerous causes of arthritis, except to mention the two chief accepted types, the atrophic and hypertrophic The atrophic, also known as rheumatoid arthritis, infectious arthritis, and proliferative arthritis, effects mostly those of the ages between twenty and forty, or the young adult, more frequently women, it is usually polyarticular, involving many symmetrical joints, and prognostically not very favorable, ending many times in ankylosis, deformity, and crippling, in most instances focal infection is an etiologic feature, there are numerous other features characteristic of this type

intervertebral spaces and right and left dorsal regions for about ten minutes is also helpful in reducing blood pressure

Finally, may we emphasize again, that every hypertension case must receive individual study with removal of every focus of infection, particularly in the colon

In the treatment of *hypotension*, carbon dioxide and other gas baths are found beneficial Personally we have had no experience with these We do, however, use colonic irrigations with the object of eliminating possible substances of a depressor character, or effecting the endocrine organs controlling blood pressure, but rely mainly upon medicinal and other therapy

Respiratory Affections

Physical therapy is applicable in numerous disorders of the respiratory tract, from the common cold, for which the quartz lamp is generally used, to the most extensive pathologic conditions of the lungs demanding particular modalities In bronchitis, either acute or chronic, considerable relief may be obtained from pain, cough, and pectoral oppression by the use of radiant heat, diathermia, and ultra short wave therapy, in some cases the addition of ultraviolet is advisable In pleuritic inflammation, especially where localized, light therapy or infrared is beneficial In pneumonia, where diathermia is more frequently used, it is applicable in every type and stage, in bronchopneumonia, lobar pneumonia, and delayed resolution Here it induces hyperemia, softens infiltration, accentuates biologic enzyme activity, and aids local nutrition Great relief from pain, dyspnea, and cyanosis is obtained because of its sedative effect and the improvement in pulmonary circulation—the pulse slackens, sweating occurs, respiration deepens, resolution and soft rales appear, and the attack is shortened In some of our Institutions, diathermia is used as routine treatment, the anteroposterior technic, or the active electrode over the localized spot is employed, giving the patient a half to one hour treatment several times daily, it is applied in the early stages, with considerable dosage of 1,000 to 2,000 ma Such therapy with the addition of oxygen has helped us to save some desperately ill cases

In cases of empyema where this treatment has been tried, only a hastening of suppuration was observed

The use of heliotherapy, natural or artificial, in *tubercular affections* of the respiratory tract need not be emphasized here, it is common knowledge and used all over the world Heliotherapy has an effect upon calcium and phosphorus metabolism, which minerals seem essential in the healing of tubercular lesions, it may also have other biologic curative qualities with which we are at present not familiar If employed in the earlier anergic states it is most helpful, but must be skillfully applied

The individual uses of radiant heat, infrared, electric baths, compresses, etc need not be dilated upon here

Gastrointestinal Disorders

In intestinal disorders the most common use we make of physical therapy is in the treatment of chronic constipation Before any case is treated for this disorder, the colon is x-rayed and studied for local causes, e g , adhesions, angulations, ptosis, fecal tumors, also for the type of constipation, whether atonic or hypertonic, each case is treated accordingly In *atonic constipation* due to muscle weakness, dilatation or lack of rectal reflex, every measure must be taken in addition to physical therapy to assist bowel evacuation, wrong modes of living must be corrected, sedentary habits eliminated, defecation at regular intervals encouraged, the abuse of cathartics stopped, exercises to strengthen the abdominal walls or a support to lift the ptotic abdomen prescribed The physical treatment consists of irrigations, correct abdominal massage, and Morse wave electricity Every colon must first be irrigated to remove its solid and gaseous content, this to prevent their being kneaded into the mucosa, and their absorption Massage follows and is given in accordance with the state of the bowel and the position of its various segments as shown by x-ray examination In massaging the colon, first with the fingertips to each individual portion, then by rolling and kneading motion, care must

spasm or thrombosis during treatment, which might well alarm patient and doctor alike.

Dr Gutman's remarks concerning the treatment of selected cases of hypertension by physical means are bound to reawaken the controversy on the value of autocondensation in this syndrome He is not alone, of course, in his belief that it is of value Among other authorities Titus has assured me that the effect is unquestioned, in his experience My own results were disappointing but this may well have been due to faulty technic and improper selection of cases

It is obvious that we should not condemn any method without proper evaluation The other physical measures mentioned including colonic irrigation, are of undeniable value Here again I think we have held off too long and too dogmatically I share with others the deserved criticism that we deprecated the value of colonic irrigations long after its value was proven, perhaps largely because we were so outraged by the unscientific abuses of the commercial "colonic filling station" The longer I use this method, in selected instances, the more impressed I am with its value

I have a very personal interest in Dr Gutman's remarks on the use of diathermy in pneumonia—especially in delayed resolution In 1932 I reported eight cases of unresolved pneumonia, all cured by diathermy I ventured then to state that unresolved pneumonia is not the rarity that the texts and current literature would have us believe

I might add to my agreement with Dr Gutman's discussion of the treatment of lobar pneumonia that I have never seen a crisis occur in any instance where diathermy was used, in itself of great importance Since the recent advent of short-wave therapy I have had insufficient material to compare this wave with long wave diathermy

Of the greater ease of application with short-wave diathermy, there can be no question—and this is of special importance in children, of course It has also been demonstrated that the penetration of heat to the deeper structures, in a selective manner, is greater with the short wave—especially so with six meter The speed with which deep heat is built up with short wave seems to me of great consequence since high internal temperatures can be attained before the blood supply has the opportunity to dissipate it

Whether the ultra short-wave of 50,000,000 cycles will, as Schliephake claims, cause actual sterilization of empyema without surgery is of tremendous interest My experience with this wave in other suppurative processes leads me to believe that it may be true So far I have had no opportunity to apply it

It seems that we should keep an open mind regarding the claims of the German physicists Whether there is anything more than heat effect from ultra short-wave diathermy is still an open question My own belief, after two years of experience with it, is that heat is only a part of its effect in some infections In gonorrhea of urethra, cervix, tubes, joints, however, there seems no doubt that Bierman, Horowitz, and others have proven that heat is the entire mechanism of sterilization Also they have proven that their combined method of local heat and systemic fever gives astonishingly quick results in sterilizing the body insofar as the gonococcus is concerned Pelvic heat alone with six meter diathermy accomplishes a result in pelvic gonorrhea but is far slower than the combination of fever therapy with local heat

Fever therapy itself has been omitted from Dr Gutman's paper, I note. While it is still too new to be discussed fully by anyone except those who have worked with it, which I have not, I do feel that no discussion is complete without at least acknowledging the tremendous value of this method I have observed amazing things, the most notable being intractable gonorrhea cured in one session of twelve hours of systemic fever combined with six hours of pelvic heat, the technic of Bierman and Horowitz, referred to above

DR. VIRGINIA SHEPHERD TANNENBAUM, *Buffalo*—Dr Gutman has emphasized the value of physical therapy in the treatment of many conditions

Heat and increased circulation are Nature's reaction to infection and to injury Physical therapy, properly used, simulates Nature's method of healing, in many instances

Of the modalities, now available, though long-wave diathermy gives outstandingly gratifying results in the treatment of pelvic infections, it should be mentioned here that the duration of the treatment, of not less than one hour, and preferably of two hours, and the proper placing of sufficiently large electrodes, thus allowing larger amperage, is of utmost importance in producing resolution of the pelvic infection

The Elliott treatment offers a choice of technic for the prolonged and localized administration of heat to the pelvis

In my experience, no condition responds more favorably to the nice selection of modalities than does the swollen sloppy

The chronic hypertrophic type, also known as osteoarthritis, presents considerable differences This occurs in older people, usually forty and over, is without premonitory symptoms, commonly effects one or but very few larger joints, is slower in progress, less disabling, and pathologically and radiologically differs from the previous type Success in treatment of either type is greatest when the patient is seen early, when involvement is still slight One need not stress here again the necessity of eradicating every possible focus of infection, no matter how slight or where located, whether in the teeth, tonsils, prostate, seminal vesicles, gall-bladder or other organ, the colon as such source must not be forgotten, it is advisable in every case of arthritis to administer thorough colonic therapy

Of other physical measures, local heat is most dependable, for it improves the blood supply and lymphatic circulation of the joint, assists in absorption of deposited material and promotes in many instances the restoration of function Any one of the modalities supplying heat, as infrared, luminous heat, baking, light cabinet, etc may be employed Diathermia is exceptionally valuable, also ultra short wave, in all types of arthritis The technic depends, of course, upon the joints treated After heat application the joints should always receive proper massage with or without some suitable ointment, as desired In some instances the static and low frequency current may help to stimulate muscle tone Active and passive exercises should be administered to assist in restoration of function In many instances it is also well to prescribe general treatment, as hot baths or electric cabinet, as used in various watering places where arthritic affections are treated Mecholyl iontophoresis in the hands of the experienced is a valuable vascular dilator, assisting circulation in joints, relieving pain, and improving function While fever therapy as well as x-ray are recommended by some investigators, these have not yet acquired popularity

In gonorrheal arthritis the value of hyperpyrexia is well-established, it is apparently the best treatment today In tubercular arthritis, heliotherapy—natural or artificial—is most effective, it has been in use for many years, abroad and here, and given excellent results Stiff joints with defective mobility may be helped by suitable exercises, but must be treated carefully and scientifically

The physical therapeusis of many other conditions closely allied to arthritic disease as lumbago, myositis, spondylitis, bursitis, synovitis, as well as of numerous other medical affections not mentioned here, in which physical therapy is extensively used and extremely helpful, must necessarily be omitted from discussion because of time limit

Conclusion

May we repeat that since physiotherapy has made such great strides in but few decades in the past, with immense benefit to humanity, it is to be hoped that even greater progress and advances will be made in the future The surgeon and the surgical specialties have taken advantage of such progress, utilizing particular modalities in the performance of their special work The internist is recognizing its usefulness more and more, and is applying physical therapy more willingly and more frequently in the numerous medical disorders he is called upon to treat Personally, we had occasion during the past twenty-five years to treat numerous cases of every type, with results, at least from a functional viewpoint, generally satisfactory in most instances Each case, however, must previously be carefully studied and etiologic factors excluded if good effects are to be obtained from physical therapy

867 St Marks Ave.

Discussion

Dr. Harold J Harris, *Westport*—I have read but little on the use of diathermy in coronary artery disease, and the inclusion of this in Dr Gutman's paper definitely adds to its already great value I have an idea that many of us who use physical therapy largely in our practices, fail, as I have done, to realize its value in such a vital condition One thing that has been a deterrent perhaps is the possibility of attacks of coronary

spasm or thrombosis during treatment, which might well alarm patient and doctor alike

Dr Gutman's remarks concerning the treatment of selected cases of hypertension by physical means are bound to reawaken the controversy on the value of autocondensation in this syndrome He is not alone, of course, in his belief that it is of value Among other authorities Titus has assured me that the effect is unquestioned, in his experience. The Elliott treatment offers a choice of technic for the prolonged and localized administration of heat to the pelvis

In my experience, no condition responds more favorably to the nice selection of modalities than does the swollen sloppy

cervix, this often complicated by an endocervicitis, with its dreary mucopurulent vaginal discharge First, these water-logged cervices should be dehydrated with zinc ionization, and then the ulceration of the endocervicitis should be electrocoagulated or electrodesiccated, depending on the extent of the ulceration This latter treatment should be given but once a month, at the end of the menstruation period, thus allowing three weeks for the cauterized area to heal

I have felt more comfortable limiting the use of the short-wave diathermy to treatment of the extremities where the degree of heat produced can be palpated

The Pavex machine, the improved short wave, the fever-box and the Elliott machine are the newer additions to the physiotherapy modalities

CONGENITAL SCOLIOSIS

Due to Unusual Deformity of Vertebral Column

JOHN W GHORMLEY, M D, *Albany*

Only a small percentage of cases of organic scoliosis are caused by demonstrable congenital defects However, any gross congenital defect of the vertebral column will usually cause some scoliosis The following case of congenital scoliosis is of interest because of the various congenital anomalies in the vertebral bodies as well as in the ribs

Case Report

J C, ten months, white, female was first seen by me on March 25, 1935 She was full term, first born child who had weighed six and one-half pounds at birth Pregnancy and delivery had been normal Soon after the child's birth, the mother noted what she regarded as a swelling in the lower left back She brought the child to the clinic when this swelling seemed to become worse instead of better Examination showed a compound dorsolumbar scoliosis which tended to disappear when the child was supported X-ray examination by Dr W P Howard is reported as follows "There are eleven dorsal vertebrae. On the right side, there is a cervical rib There are eleven ribs on the right side and ten on the left. The fifth dorsal vertebrae is divided into two segments

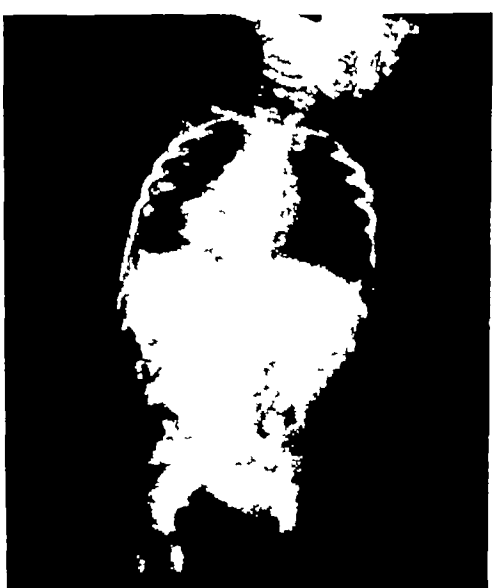

Fig 1 Anteroposterior view at eleven months

Fig 2 Lateral view at eleven months.

Fig 3 Lower dorsal spine at thirty-three months

vertically through the midline. The ninth dorsal is divided into two segments obliquely, the right being fused with the eighth dorsal and the left segment being free The second and third lumbar vertebrae are fused There is a lumbodorsal scoliosis, convex to the left The sixth and seventh ribs on the left side are fused distal to their heads and separated again in the posterior axillary line"

It was thought that immobilization in plaster would tend to correct the curvature and so a plaster jacket was applied, the child being suspended during the application to lessen the curve The original jacket remained in place three weeks and since that time thirteen additional casts have been applied At the present time each cast remains in place four or five weeks and an interval of a week or two is allowed between each application in order to allow the condition of the skin to improve and in order to prevent too much muscular atrophy With this treatment the curvature has tended to decrease Exercises to strengthen the muscles of the back will be instituted as soon as the child is old enough to do them Some form of internal fixation will probably be necessary when the child has grown

DRUG COUNTER PRESCRIBING

"The Billion Dollar Sneeze" is the title of an article in *The American Druggist* The article is well written and discusses the probable etiology of the common cold, not overlooking the popular conception that a lack of vitamins may have something to do with a person's susceptibility to frequent colds

The amazing thing about the article, to *The Journal of the Indiana State Medical Association*, is the frank advice to druggists to set their stores in order and go out after this "cold business" As a sales talk it is very good and its author frankly advocates both diagnosing and prescribing on the part of the drug clerk "Here are five steps our customers should follow," says the author, "to aid in the prevention of colds When they follow these steps your preventive products sales will increase" The author also advises that "Clerks should be taught the practical advantage of solicitous inquiries about customer's symptoms Muscular pains, sore throat, headache, clogged nasal passages, chills, chest pains and coughs, each may be the basis for the sale of a product over and above the one the customer came in to buy" In other words, a marked step-up in counter prescribing is advised The enterprising drug clerk is told just what he may do toward making a diagnosis, but not one word is said about having the drug clerk offer the very good advice that it would be well for the prospective customer to see his physician, and that the thing complained of may not be just a common cold

The article seemingly omits nothing It advises in the matter of an "over-acid condition of the body" and suggests that milk of magnesia, antacid powders and tablets may be suggested with safety Laxatives come in for lengthy comment and the naive suggestion is made that "you can recommend a ten-cent item or make a $1 25 sale, depending upon your method of merchandising Every druggist knows the range of laxative preparations and they are too numerous to classify"

Drug clerks have little more than a smattering of medical knowledge, certainly not enough to qualify as differential diagnosticians We know of the dangers attending even the common cold, we know the remedies therefor, we alone should determine what the patient should do

ACUTE PHARYNGEAL STENOSIS

ROY SEELEY MOORE, M D, *Syracuse*

In the early days of my practice I was in charge of the ear, nose, and throat work in the Syracuse Contagious Diseases Hospital At that time, diphtheria was rampant and acute laryngeal stenosis was our most trying problem Since then, all cases of dyspnea, caused by mechanical obstruction of the air passages, have been of particular interest to me D Havantare discussed it in Sanskrit, in the 6th Century, B C, and Aretaeus and Hypocules made references to sore throats which were distinguished as quinsy, angina, cynache, and syneche In the *Third Book of Epidemics of Corpus Hippocraticum*, there is an account of a case which began in the tongue of a woman In Adam's translation the passage is as follows "Speech inarticulate, tongue red and parched, on the first day felt chilly and afterward became heated, on the third day a rigor, acute fever, a reddish and hard swelling on both sides of the neck and chest, extremities cold and livid, respiration elevated, the drink returned by the nose, she could not swallow, alvine and urinary discharge suppressed, on the fourth day all the symptoms were exacerbated, on the sixth day she died of quinsy" Swellings and abscesses of the neck which might endanger life were described by Hippocrates He told us that if the abscesses were soft they could be opened with the finger and if not an iron could be used for the purpose Galen explained retropharyngeal abscess in the Second Century and warned that some cases result fatally

Of necessity, the larynx—the narrowest part of the upper respiratory tract—becomes most easily closed by acute inflammatory reaction or injury With reference to the large number of cases of dyspnea due to partial closure of the larynx seen by all of us, it is noteworthy that the anxiety we have felt on numerous occasions and the satisfaction experienced following relief of the alarming symptoms, have forced us to overlook the occasional case where the obstruction is in the wider passage above the larynx. A search of the English textbooks and the English, French, and German literature of the last ten years has failed to disclose a discussion of acute pharyngeal stenosis due to inflammatory reaction where the thought was other than to reduce the swelling to prevent edema of the larynx or to point out the indications for tracheotomy That many of you have seen and surgically cared for cases where the obstruction was in the pharynx only, I am

TABLE I—TYPES OF ABSCESSES CAUSING OBSTRUCTION IN AND ABOVE THE LARYNX

Superficial abscesses

1 Peritonsillar abscess
2 Retropharyngeal abscess
3 Laryngopharyngeal abscess

Deep abscesses

1 Submaxillary fossa abscess
2 Parotid fossa abscess
3 Pharyngomaxillary fossa abscess
4 Abscess along carotid sheath due to extension from jugular sinus thrombosis
5 Deep abscess of the tongue

quite sure, but you have failed to get the case histories into print On three occasions, I have been forced to do a partial or complete tonsillectomy for the relief of an acute stenosis of the pharynx, the hemolytic streptococcus being the offending organism, and on two occasions I have since performed the same operation from choice Because tracheotomy is the operation almost universally done and because there is a question of doubt as to its advisability under certain conditions, I have studied the acute inflammatory reactions of the mouth and pharynx, which have been admitted to the University Hospital of Syracuse during the past fifteen years, with a view to determining the kind and frequency of reactions of this type which

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

produce dyspnea and the procedures that were used for their relief From this study, one must conclude that the usual cause of an acute closure of the pharynx is an acute infection with abscess formation If the acute infection is grafted upon a throat already narrowed by tumor formation or cicatrix, less swelling is required for a complete stenosis For clarification, I have divided the abscesses which directly or indirectly might be the cause of dyspnea into those which are comparatively superficial and those which are located deep in the tissues (Table I)

Table II is the result of my study of abscesses of the mouth and pharynx among the 84,988 admissions to the University Hospital of Syracuse during the period between 1922 and 1937

I have purposely omitted from Table II the term "Ludwig's angina" It was first described by Ludwig in 1836 Dr Chevalier L Jackson[1] defines it as an "acute inflammatory process involving the cellular tissue of the floor of the mouth and the submaxillary region of one or both sides" Imperatori,[2] in his more recent text, calls it "an infection of the tissues of the floor of the mouth" In this study, I find the word used very loosely, the physicians usually meaning the patient had a brawny swelling in the upper neck with or without an abscess pointing in the mouth For purposes of clear thinking and definite surgical planning, it seems logical to substitute a definite anatomical terminology I also found the term "phlegmon" used in such a way that only confusion of thought could result It would seem logical to confine its use to those cases where the brawny reaction originates in connective tissue When an abscess results, it should again be diagnosed according to the anatomical location of the abscess

We had, then, in 84,988 admissions in a 225-bed hospital over a period of fifteen years (made up of a high percentage of adults), fourteen cases of dyspnea due to soft tissue reaction above the larynx—eight complicated with peritonsillar abscess, three with retropharyngeal abscess, and three developing in patients with deep abscess of the tongue. There were two cases of submaxillary fossa abscess and one parotid fossa abscess associated with peritonsillar abscess One tonsillectomy was done for the relief of dyspnea in peritonsillar abscess and one in retropharyngeal abscess

I wish to give the history of two of these cases—the tonsillectomy which was performed by me on the case of peritonsillar abscess and the drainage of the deep abscess of the tongue, both being done for the relief of dyspnea, and to supplement these case histories with two others where tonsillectomy was done by me in the homes for the relief of an acute pharyngeal stenosis

CASE 1 In the Fall of 1918, I was called to see a four-year old girl in consultation with Dr G, the child having been ill one week with a so-called follicular tonsillitis, the temperature ranging between 101 and 104°F On the morning of the eighth day, because of dyspnea, I was asked to do an intubation in the home, the supposition being that the child had a laryngeal diphtheria (in those days, all cases of acute laryngeal stenosis were assumed to be diphtheritic in origin) The little girl had the frightened appearance of one who was struggling for air, the pulse was rapid, lips and fingernails bluish in color There was substernal retraction on each inspiration There was lacking, however, the little "whistle" which is present when air is being forced through the narrowed larynx The child was wrapped in a sheet and held in the upright position by the doctor for an indirect intubation On opening the mouth gag, I found the left tonsil pushed completely across the pharynx in contact with the right pharyngeal wall by a peritonsillar abscess The right tonsil laid back of the left, almost completely occluding the pharyngeal orifice. The abscess was opened but the dyspnea persisted

While the right tonsil was held forward, the patient breathed freely, the substernal retraction ceased, and complete relief from the dyspnea was experienced When I let go of the tonsil, it dropped back into the funnel again producing partial occlusion I recognized that an intubation would be useless and as I had no tracheotomy set with me, I removed the right tonsil under a little one per cent novocain, with a scissors and snare. The child breathed very satisfactorily after the work was done and made an uneventful recovery

CASE 2 In August 1924, B, age thirty, a teacher, was brought into the University Hospital of Syracuse with bilateral peritonsillar abscesses Almost as soon as the patient was in bed, he developed marked dyspnea and stopped breathing within a few minutes On my arrival, the intern and

nurses were attempting to perform artificial respiration but getting no air into the lungs Propping the mouth open with a gag, while a tracheotomy set was being rushed to the floor, I found the tonsils to be overlapping one another and behind both there was a peritonsillar abscess lying deep around the lower pole. Grasping each tonsil with a forceps, I pulled them as far forward as possible, placing an airway in the pharynx. Artificial respiration was resumed and the patient soon regained consciousness On removal of the airway, the man stopped breathing When the tonsils were again grasped and held forward, he breathed easily The peritonsillar abscesses were opened and a great quantity of yellow-purulent material was discharged, but this did not relieve the dyspnea. The right tonsil was then removed by dissection and snare under novocain, with complete relief to the patient Subsequently, the tonsillectomy was completed and the patient made an uneventful recovery from the acute reaction

CASE 3 In May 1932, C, age thirty-five, living in a town fifteen miles from Syracuse, developed bilateral peritonsillar abscesses At 3 A M the family doctor telephoned me that the patient had stopped breathing, but that he could still get his pulse. Another physician was with him in consultation Remembering my former experiences, I surmised that the obstruction might be in the pharynx. I requested the doctor to pry the mouth open with a gag and pull the most exposed tonsil forward in the hope that an airway might be established, at which time they were to attempt artificial respiration In a few moments, he again came to the 'phone to tell me that the patient had resumed breathing They held the tonsil forward while I drove the fifteen miles to open these abscesses, which I did without benefit to the patient. As I had my suction apparatus with me in the car, I found it easy to remove the larger tonsil under local anesthetic. Complete relief from the dyspnea was experienced. He, too, made an uneventful recovery

CASE 4 In 1925, O, age thirty-five, was admitted to the University Hospital of Syracuse, with the history of a tonsillitis of several days duration followed by inability to open the mouth and for the past two days he had experienced the greatest difficulty in swallowing fluids For four hours, dyspnea was present, the fingernails and lips were bluish, pulse 110, and temperature 104° F

Examination revealed the tongue to be pushed up into the roof of the mouth and in the submaxillary region there was definite swelling The patient was immediately taken to the operating room and a flexible airway passed, with a good deal of difficulty, into the pharynx. I then opened the submaxillary fossa, after the method of Dr Mosher, cutting the facial vein and lifting the gland with the facial artery out of its bed From this fossa, with a blunt forceps, I probed upward and backward into the deep tissues of the tongue, where I obtained a quantity of purulent, fetid smelling material The patient was relieved almost immediately, after which the airway was removed He made an uneventful recovery

Conclusions

1 When acute inflammatory reactions in the pharynx produce dyspnea, the stenosis is usually in or around the tonsillar aperture

2 Reactions in the pharynx, causing obstruction to the passage of air, are usually either peritonsillar abscesses, pushing the lateral wall into the pharynx, retropharyngeal abscess, pushing the posterior wall forward, or deep abscesses of the tongue, pushing the floor up

3 The most common offender, from the standpoint of the number of cases involved, is deep abscess of the tongue, with 75 per cent developing an acute stenosis, the retropharyngeal abscess comes next, with twelve and one-half per cent having difficulty in breathing, peritonsillar abscess is third, with four plus per cent developing dyspnea

4 When dyspnea is present with peritonsillar abscess, the most common secondary abscess adding to the stenosis is submaxillary abscess—twenty-five per cent of peritonsillar abscesses having acute stenosis developing this complication

5 When deep abscesses do develop, the average man caring for these cases has no definite plan of attack, the reason being that the cases are rare except in very large clinics and usually head toward the surface, as shown by Havens in his comprehensive report,[8] where the anatomical difficulties are slight and the mortality small

6 Because we occasionally do get a deep burrowing abscess that will test the best that is in us and because more of the cases fall into the hands of the otolaryngologist because of the dyspnea, we should become thoroughly familiar with some

definite plan of attack which will require, as Dr Mosher has suggested,[4] a detailed knowledge of the anatomy around and above the hyoid bone

This review justifies a study of the literature as to the comparative safety of tonsillectomy and tracheotomy for the relief of an acute pharyngeal stenosis due to infection For this comparison, I have obtained the mortality record on tracheotomies done in four of our larger hospitals for the treatment of contagious diseases, inasmuch as most of their tracheotomies are done for the relief of an acute streptococcus pharyngo-laryngo-tracheitis

During the years 1935 and 1936, at the Boston City Hospital there were six tracheotomies done with four deaths, at the Philadelphia Hospital for Contagious Diseases there were eighteen tracheotomies performed with eleven resulting in death, at the Syracuse City Hospital three tracheotomies and one death, and at the Willard Parker Hospital in New York City they had nineteen tracheotomies and ten deaths, making a total in these institutions during these two years of forty-six tracheotomies with twenty-six deaths, showing a death rate of fifty-five plus per cent

For the records of tonsillectomy done in the presence of acute infection we have to turn to those published by the men who favor tonsillectomy for the relief of peritonsillar abscess, or for the relief of deep infection in the neck where the disturbance originated in the tonsil Of the former, there are many A Linck[5] concludes his review of peritonsillar abscess and its treatment with the statement that tonsillectomy at all stages of the abscess is the procedure of choice, reporting the records of 168 patients so operated without a single complication from propagation of the infection We have to remember, also, that we have all performed many tonsillectomies where the question of persisting acute infection was difficult to decide, with no untoward effect in most of the cases

My conclusions are that we occasionally do get an acute stenosis of the pharynx only, which will require either a tracheotomy, a tonsillotomy, or a tonsillectomy, that it is found where abscesses are present and in the region of the tonsillar aperture and that an examination of this area should always be made before concluding that the closure is in the larynx When the pathology is located in the pharynx and drainage does not relieve the symptoms, it is much safer to remove all or part of the tonsils than to perform a tracheotomy

Discussion

DR CLAYTON M BROWN, *Buffalo*—I am sure we are all indebted to Dr Moore for focusing our attention upon this fairly uncommon condition

This report of the incidence of pharyngeal stenosis covering a period of fifteen years in a general hospital, is probably the first attempt to arrive at an accurate knowledge of the frequency of this condition in a community as a whole.

To those whose experience is limited to children's hospitals the incidence will probably seem low, while those whose work is principally among adults it may seem a trifle high The greater frequency of retropharyngeal abscesses and of postnasal and pharyngeal obstructions in children would probably explain this difference in incidence. With improved feeding conditions in the very young, the frequency of retropharyngeal abscesses has certainly declined in the past few years

It is quite probable, also, that the very numerous tonsillectomies and adenoidectomies will further reduce the frequency of pharyngeal stenosis of the future

Of course, to the older men, in the days before diphtheria antitoxin and toxin antitoxin, these upper respiratory stenoses were almost a daily occurrence, and most up-to-date physicians had intubation and tracheotomy sets with them at all times For these men the first thought in dyspnea is for a laryngeal and not a pharyngeal stenosis The symptoms and the clinical findings, however, are quite different. In all cases of dyspnea a pharyngeal examination should be made and the pharyngeal possibilities of stenosis excluded In infants a digital examination of the lower pharynx may be nec-

essary to exclude the possibility of a retropharyngeal abscess

To me the great lesson of this paper is the location of the cause of dyspnea and its removal

I think we have often been too conservative in waiting a more convenient time when pus was not present to do our tonsillectomies Dr Moore's success in these cases of dyspnea in the presence of peritonsillar abscesses is conclusive proof of its safety in experienced hands

This removal of tonsils in the presence of a peritonsillar infection is routine precedure with many men and seems to be very successful, though I have never attempted it myself

To me, the work of Iglauer of Cincinnati and Batson of Philadelphia in the surgical approach to these deep abscesses of the neck, which may be the cause of dyspnea, is exceedingly intriguing and certainly simplifies the operative procedure

---

UNAPPRECIATED AMERICAN HEALTH RESORTS

Bernard Fantus, M D , Chicago, (*Journal A.M.A* Jan 1, 1938), points out that physicians who visit any number of American spas and health resorts will find that there is something radically wrong with nearly every one of them

Manager and owner complain that this is due to lack of patronage by physicians But physicians find that few of the resorts are worthy of their patronage. Obviously a vicious circle exists, which, like the vicious circles of disease, can be broken only by a suitable remedy The ideal climate and the most curative mineral water are of no use to many sick persons unless there can also be secured suitable hotel accommodations and appropriate diet, and these must be available within the financial means at the command of the patient.

Physicians are disgusted with the quackish propaganda and practises of most American health resorts They and their patients know more about the European than the American spas, although as a matter of fact there are in this country practically all the climatic and balneic remedies possessed by any other country in the world This state of affairs costs Americans many millions of dollars annually There is not only a net loss to this country but also a financial loss to the patients who are sent abroad for a treatment that they could secure much more economically nearer home

American physicians are in great need of information regarding the natural remedial resources of their own states, and it should be—indeed it is—the function of the state governments to secure and disseminate this information Unfortunately, the state governments, with a few notable exceptions, have largely been derelict in this matter Mineral water resorts should be health resorts in the truest sense, and health resorts that specialize in the treatment of the diseases for which the natural resources available in the place especially fit them

Unfortunately, there are in this country few institutions of this kind, and these few are not sufficiently well known to the rank and file of the American medical profession

With over 2,000 places in the United States boasting of springs of more or less medicinal value, with the possibility of commanding watering places in almost any climate and at any season, the members of the medical profession are so poorly informed about them that, when need of spa treatment arises, they are more likely to know a suitable European spring than one in this country This is because textbooks and teachers have more to say about the latter than the former

Distrust and skepticism likewise prevail regarding our mineral spring resorts With a few notable exceptions this is well merited, for the mendacity of many of the advertisements for mineral springs rivals that of the claims for "patent medicines" in their palmiest days Unethical practice and quackery abound in and around health resorts Even the social features and amusements, in many of them, may be objectionable from a therapeutic as well as a moral standpoint.

The American Medical Association has struggled successfully with such problems as the improvement of medical education, through its Council on Medical Education and Hospitals, and with the still thornier problem of proprietary medicines through its Council on Pharmacy and Chemistry It is helping physicians to a better appreciation of dietetics and of physical therapy by the councils dealing with these matters It now remains for it to render the same service to this important as well as largely unappreciated national remedial asset.

HABITUAL ABORTION

Treatment by Injection of Pregnancy Serum

SAMUEL S ROSENFELD, M D, *New York City*

There is a veritable host of causes for abortion, miscarriage, premature labor, and habitual death of fetus What we are here concerned with is that class of cases who either habitually abort, miscarry, have premature labors or habitually give birth to dead fetı and in whom no discernible or palpable cause is either demonstrable or ascertainable For the sake of brevity in this paper, we will include all or any of these states in the general term "habitual abortion"

We are very much in the dark when we seek to cure these patients for so little is definitely known about the etiologic factors The recent literature points to hormones, vitamins, and even the psyche as the most probable factors concerned in the production of these conditions

A review of the literature shows that Sellheim[1] was the first and only author to report the use of normal pregnancy serum in the treatment of habitual abortion He was prompted to use this therapy after reading Mayer's report on the treatment of cases of toxemia of pregnancy by the injection of blood serum of healthy pregnant women To date Sellheim reports nine cases, in eight of which the treatment was fully successful, in the other, there was premature labor in the sixth month

His usual method of administration is to give injections of ten c c of the serum every two weeks from the second or third month of pregnancy He has also given it at monthly intervals and states that it is not necessary to give it throughout the pregnancy He believes that the beneficial effects are due to substances in the serum of healthy gravid women which have a quieting effect on the uterine musculature He further states that the reason for the action of the pregnancy serum has not yet been fully explained nor has the exact dosage been determined

We know that normal human pregnancy serum contains rather large amounts of the estrogenic and the gonadotropic hormones There are smaller quantities of the thyrotropic, adrenotropic and corpus luteum hormones There are undoubtedly other hormones whose presence and action have as yet been undiscovered

Frank[2] found that when rats were injected with blood extracts from pregnant women the ovaries showed either numerous large filled follicles or several corpora lutea

Guerico[3] studied the effects of the injection of human pregnancy urine on the calcium magnesium and phosphorous content of the blood of rabbits and found a marked increase in the blood magnesium but no change in the blood calcium or phosphorous

Glaubach[4] states that during pregnancy there is a physiological hyperthyroidism due to the increase in the thyrotropic hormone from the anterior pituitary gland This may become pathological and destroy the pregnancy as was demonstrated in animals in which thyrotropic hormone of the anterior pituitary or thyroxin caused resorption of the embryo and changes in the ovaries and the thyroid

Herold[5] found that the antithyroid protective material of the blood is lower than normal during pregnancy and in Basedow's disease

Putzu[6] states that the diminished excretion of hormones in habitual abortion is not the cause but is a result and is evidence of hypofunction of the whole endocrine system during pregnancy

I am very grateful to Professor George B Wallace and to Dr Allan J Stinchfield for their invaluable advice and for their supervision of the pharmacologic experiments carried out in Professor Wallace's laboratory at the Medical College of New York University

I wish to thank Drs Samuel Forer and Emanuel J Richter for their aid in obtaining the serum and for their assistance in the laboratory experiments

From the Department of Obstetrics and Gynecology, Lebanon Hospital

Starr and Patten[7] found that intramuscular injections of extracts of pregnancy urine into four persons with hyperthyroidism produced no change, however four out of five women younger than the menopausal age were benefited by such treatment.

D'Amour and Gustavson[8] and others have shown that where large amounts of estrin were administered after implantation, pregnancy was terminated by the death of the embryo Shute[9] is of the opinion that the resistance to proteolysis found in the blood of aborting women is due to estrin

I began using normal human pregnancy serum on purely theoretical grounds It seemed to me that the serum of patients who habitually abort either completely lacks or is deficient in one or more of the necessary hormonal, antihormonal, activating or inhibiting substances necessary for the normal progress of pregnancy I felt that serum from normal pregnant women contained everything essential for the normal progress of pregnancy and that these substances could be transferred by intramuscular injections These substances might be and probably are hormones or hormone activators, whose function might be inhibition of forceful uterine contractions and activation of placental fetal and uterine growth

Our own experiments *in vitro* on a pregnant cat uterus containing embryos, showed that normal human pregnancy serum caused a marked reduction in the number of uterine contractions with concomitant long relaxation periods

A strip of human uterine muscle resected at the time of cesarean section also showed a relaxing effect of this serum When serum from an habitual aborter was added there was a noticable increase in tone. We repeated these experiments on other pieces of excised uterine muscle, but unfortunately, the specimens were useless, as no normal contractions could be obtained

I was of the opinion that pregnancy serum possesses the common hemostatic property of most sera We found that it has this property but serum from an habitual aborter is just as effective

It is highly problematical whether progesterone is responsible for the good effects of this serum for Bloch in assaying the circulatory blood of pregnant women for progesterone content found none in amounts up to 500 c c

I have been treating cases of habitual abortion with approximately five c c of normal pregnancy serum injected intramuscularly once a week Should staining or bleeding occur during the course of treatment the patient is put to bed and doses up to ten c c may be given two or three times a week or even daily depending on the signs and symptoms In the absence of bleeding, patients are permitted to pursue their normal routine and duties The diet is that usually prescribed for a normal pregnant woman with the addition of cod-liver oil and viosterol However I have positive knowledge that some of the patients failed to take both the cod-liver oil and the viosterol

Patients were advised to abstain from sexual intercourse, but not all of them heeded this advice

The serum is a pooled serum obtained from normal pregnant women whose Wassermann reactions are negative The blood is obtained under aseptic precautions and centrifuged The serum is then poured into sterile tubes and kept in the refrigerator until used The patients are injected until the beginning of the tenth lunar month

Theoretically the most efficient serum should be furnished by multiparae who have no history of abortion, miscarriage, premature labor or intrauterine death of the fetus, and whose gestation period has not exceeded the eighth lunar month Due to the dearth of material we have not been able to confine ourselves to ideal donors, and yet, the results were very gratifying (Table I)

Comment

While I have no statistics at hand to prove my assertion, it is my impression that under the conventional methods of treatment of habitual abortion the great majority of patients aborted

I do not know what constituent or constituents of the normal pregnancy serum are responsible for the effects It seems to me that the major effects are due to hormones and that the hormones are of the activating and inhibitory types, and

that normal sera contain these substances in the proper amounts and proportions

It is a moot point whether the results obtained can be ascribed to any of the known hormones or their precursors individually We know that the treatment of habitual abortion with estrin and prolan alone has proven disappointing The progesterone content in the small amount of serum that we inject is either nil or infinitesimal and the effects can therefore hardly be ascribed to its action What part the thyrotropic hormone of the anterior pituitary and the thyroid itself play in this complex mechanism must also remain unanswered for the present

Much more proof than has as yet been brought forth is necessary before one can safely ascribe a detoxifying action to the serum My results with normal pregnancy serum in the treatment of pernicious vomiting of pregnancy and toxemia of pregnancy have proven disappointing

The coagulant property of the serum is probably not of great importance for the serum of aborting women is just as effective in hastening clotting time

In the present state of our knowledge one cannot prove or disprove whether habitual abortion is an allergic phenomenon and if it is, does the serum act to desensitize the allergic individual?

We are also unable to state whether or not these hormones act specifically on the development of the ovum or whether they produce a higher threshold of irritability in the uterine musculature One patient in her seventh month was having regular cramp-like labor pains After an injection of ten c c of serum these pains ceased and she was delivered at term of a normal infant

We thus see that a vast amount of research is necessary before the factors concerned in the etiology and in the successful treatment of this condition can be identified

It is highly probable that the serum from normal pregnant animals might prove as effective as human serum However, I preferred to utilize human serum for it eliminated the possibilities of allergic reactions, serum sickness, anaphylaxis, etc

I am using a weekly dose of four to six c c for I noted that this amount kept the patients sign- and symptom-free, whereas, when the dose was smaller or given at longer intervals, some of the women either stained or went into labor We noted this especially in the tenth lunar month, when we ceased injecting the serum

The question might be raised, is it possible to obtain an effect from the small

Four cases are under treatment at present time. Results were successful in every case except no 4

amounts of serum that we inject? Reasoning from analogy, I believe that it is possible, for we know that similar small amounts of whole blood, sera, and placental extracts, are effective either as immunizing or curative agents, in such conditions as measles, scarlet fever, and poliomyelitis

The one failure in this series is really only a partial failure, for the patient in five previous pregnancies had never progressed beyond the eighth week and this pregnancy terminated in the twenty-fourth week Labor was caused by a premature separation of the placenta which in turn was induced by a toxemia brought on by a most stupid indiscretion in diet. In my consulting practice I occasionally see premature placental separations following Gargantuan holiday meals

I am also employing pregnancy serum in the treatment of threatened abortion and I believe the results obtained with it are far better than with the usual methods of treatment I will report these cases in a future communication

Summary

Twenty patients suffering from habitual abortion were treated with intramuscular injections of normal pregnancy serum Nineteen gave birth to normal living infants

THE NERVOUS WOMAN'

Very frequently women of all ages will present themselves for the physician's consideration with a number of vague aches, pains, and complaints whose nature is uncertain, and whose management is a source of embarrassment to the doctor Many doctors will consider this type of patient as a nuisance, and either hand her a bag of pills (usually a sedative of the barbiturate type) or tell her not to waste her money since she is not really sick. Either procedure is wrong, believes Dr Arthur J Tronstein, of Newark, Ohio, in an interesting paper in the *Ohio State Medical Journal*

Nobody actually wants to see the doctor professionally A patient comes to the doctor because he or she is ill Whether the illness is due to some specific organic lesion or lesions, or whether it is due to psychic, or functional factors is up to the physician to decide The patient complaining of pains and vague symptoms suffers from these regardless of their source She seeks the doctor to get relief from her discomfort, and is entitled to as much study as the person with an acute appendicitis Failure to give this care leads the sufferer to seek the quack, the cultist, or other competitor of the physician It not only drives the patient from the physician's door, but leaves the patient with the feeling that nobody will be able to help him or her with any future ailments This is especially true of the woman who has always had steadfast faith in her family doctor

There are many cases of women whose complaints are so conflicting, so apparently non-organic, so trifling, so seemingly foolish to the doctor that he tends to look upon them as evils he must tolerate as part of his profession This attitude has driven many patients from the physician to the quack They really are important to both the physician and the patient, and merit careful attention by the former Many of the seemingly non-organic sicknesses presented by these women, are in fact organic, and it is only because the physician is too lazy or too busy to give them the consideration they merit.

These women are suffering, and regardless of the cause of their symptoms, the doctor rightfully is charged with seeking to allay their suffering Many of the causes are not organic, but the doctor by means of his common-sense, intelligence, scientific training, acquaintanceship with public services, and honest desire to help, can do much to benefit the woman, and at the same time advance his economic status

PUBLIC HEALTH—A CONCERN OF GOVERNMENT

SAMUEL J KOPETZKY, M D, F A C S, *New York City*
Former President, Medical Society of the County of New York

Public Health—A Concern of Government—has many implications and interpretations Let me at the outset say that I see in this governmental concern no general invitation to establish State Medicine to deliver general medical care to all our people, nor do I desire to see any part of governmentally subsidized medicine take control of, or destroy the private practice of medicine

In the past, it has been the proud boast of the medical profession that it gladly shouldered the costs to itself in delivering medical care to the indigent Most of our people were gainfully employed The seasonal and the exceptional circumstances that threw a large number of wage-earners out of work were soon passed, and the burden carried by the medical profession during their transient periods of lack of working opportunity could be shouldered by the medical profession without detriment to anybody

The trend in our body-politic now shows a definite change Under conditions whose causes and origins are not yet clearly comprehended, with a higher standard of living for our working classes than anywhere in the world, we observe a course of events consisting in the gradual passing of the smaller, self-sufficient middle class group This group comprises the small store owner, the small factory owner, and the small farmer In other words, it seems as if a great part of the formerly financially independent, self-reliant middle class were being transformed by the trend of economic events into a job-holding class Formerly, this group, by individual industry and thrift, saved, and had small property holdings It gradually "grew up" financially, culturally, and politically, and actually was the backbone of our national life. Employed by this self-reliant group were many wage-earners whose occupations were on a permanent basis, their intimate personal affairs were known to their employers, and, when sickness and disability reached them, they found aid available through the influence of their local employers Often the employer's private physician took care of them, gratis

With the growth of great business corporations, these smaller business men are being crowded out. True, many of them are absorbed into the giant business concerns which killed their individualism in commerce and industry We who have lived with, worked with, and served this class for almost three decades during which this change has taken place, can testify that there is a vast difference in the psychological and cultural make-up of this class now, from what its inherent characteristics were two generations ago This group is now mostly dependent on jobs It changes its stress in education from a search for culture and an opportunity to enjoy the rewards of individual efforts, thrift and industry, and a life amid congenial surroundings, to technical education for labor service to an impersonal business organization—the directing force of which is not always even located in the same community where the worker or jobholder lives Individual efforts to excell and progress become subservient to coordinated labor, merging and equalizing the skill and intelligence of one, with the lesser degree of these qualities possessed by another Success in the worker's sphere is cumulatively estimated by what is known as his "*production*" There is less need of skill, and more need for speed work and time delivery of products

The wage earner, according to some authorities, produces goods equal in value to his wages in about a half day's work The remainder of the day that he works, the value of the goods he produces is

Address delivered at the "Conference of the Professions on the Amelioration of Human Needs" called by the National Citizens Committee for Support of W P A, New York City, March 6, 1938

for the credit account of invested money, and for the wages which management exacts It is obvious that the wage earner therefore produces much more than he gets paid for This surplus over the wages' value, is used by invested capital to take profit, to pay rent, and to pay taxes

Since management determines the period of employment, and the up-keep of the laborer is a great concern of both management and invested capital, then it would seem logical and ethical that both invested capital and management should help toward the laborer's maintenance during those periods when it determines that his work is not needed

It seems, from the trends of events, that we are faced with the probability that hereafter there will be a definite percentage of unemployed among us These are individuals who would gladly work could they find gainful work to do In the periods when recessions in production of wealth, by the combined efforts of invested capital, management, and labor are with us, the workers in cultural fields and in the professions which sell personal services—doctors, dentists, nurses and pharmacists, are among them—are likewise deprived of gainful, individual employment Their slender private resources exhausted, these too join the army of the employable unemployed

This group of individuals, a large, inactive wealth producing agency, because it is inactive, represents actual loss in money value, in terms of wages This is rightly a concern of government

Let us look at the problem from another angle Money replaced trade and barter Money concededly is the concern of government Those whose industry, thrift and shrewdness accumulated it found that the government—comprising the individuals of a state—set regulations to control and regulate its circulation, and to prevent its being hoarded, or in other words, to prevent money from remaining idle It is the concern of government that money be continually employed, and to some extent, the government now employs it for the benefit of all its people Wage-earners are potentially money Hence it requires no great stretching of principles to assert that it is the concern of government to keep idle, employable wage-earners at work for the benefit of the whole people, just as government is concerned in keeping money in circulation

Idle labor is employable in private enterprise were the latter in need of workers Where these wage-earners are not so needed then this labor presents problems which the community must solve On the one hand, there is direct waste of the community's wealth, and on the other hand, the community is deprived of the purchasing power lost because of the lack of wages due to unemployment In some figures at hand it is shown that the W P A earned for itself, as wages, about two billion dollars This money was of course expended by the W P A workers through exercise of their purchasing power, in the communities where they resided

Now in all this I have not touched upon the medical implications, yet they are inherent in the whole problem Industry, to a degree, has considered the maintenance of the health of the worker as its concern, because kept in health, his industrial productiveness is greater It has been well said that army efficiency is dependent primarily upon its good health To keep this health level high, government, which needs an effective army, expends great sums of money for medical care The wage-earner, whether employed or not, must be maintained at a high health level, and the highest quality of medical care procurable must be made easily available to him—because he is one of the sources of wealth The healthier he is, and remains, the more productively efficient he will be—whether working on his own, or on the community's account Because the unemployment problem is national in scope, the medical care of these idle, potential wage-earners becomes a concern of national government The solution of delivering the high quality of medical care which the medical profession desires to see available to this class-group must necessarily be handled, and administered locally, with as little centralization of administration as possible

To say that the public health is a direct

concern of government is not to ask that government shall be invited to engage in a federal scheme of generalized State Medicine, with destruction of the private practice of medicine This is not needed, nor wanted When we think of public health, we imply concern over healthy living conditions, sanitary regulations of food markets and food handlers We envisage restrictive regulations to lessen the inevitable hazards of mine and factory We would imply in government "concern with health," measures for hygienic conditions in the shop, the school, and the home We all desire to have health standards safeguarded at the farm, in the period of transportation of foodstuffs, and even of individuals Here medicine and sanitary engineering merge for better public service Lastly we would have the government deeply concerned with the popularization of all prophylactic preventive health measures These we desire to be made easily available for the whole people For the sick and disabled, we want nothing so much as the ability to deliver to them a high quality of medical care Today, and before this audience, I shall not touch upon the general problem, but deal directly with the problem as it concerns the W P A —a class-group composed of wage-earners, out of gainful private work, working at useful projects under government supervision and direction We have coined a term to describe their medical-economic situation We term it the "medically indigent"

As I stated above, it was traditional with the medical profession to care for the sick and disabled who were unable to pay for such care This was our pride and boast Since, however, the trends have taken place to which I have already alluded, the very amount of this work has overwhelmed the profession It can no longer carry on its shoulders this burden We believe it is a community matter, and that the service the medical profession gives the indigents—including the medical indigents—should be met from general tax funds, wherever possible from local funds, supplemented where absolutely necessary by state aid Among the states where funds are unavailable, there and there only should federal funds be implemented The local profession should be consulted as to the medical necessity for the outlay, its scope, and the ways and means of its use They are experts in such matters

The problem is in each instance, always a local one The medical profession has an organized unit admirably fitted to cooperate The County Medical organization has both the ways and the means to set up an agency to deliver the personal, individual care for the sick and the disabled with only the highest professional standards as a criterion In New York County, this endeavor has had trial and has proven successful Quoting from the inaugural address of Dr Clarence Bandler, President of that County Society "Our County Society has been able to render valuable service to the federal government in treating injured workmen on the W P A projects" With reduction of costs, there has been wider distribution of service among the physicians employed There is less dissatisfaction than under the project-doctor system, and most important of all, the quality of medical service has been improved This has been brought about with full retention of the physician-patient relationship, and with the retention of free choice of physician by the patient

In the works progress project the medical care talked about above has to do with workingmen injured during work I would like to see these panels of free associations of physicians volunteering additionally to undertake the work of delivering medical care to the indigent, including the medical indigent I would like to see the County Society set up the necessary panels to deliver medical care for all on the W P A rolls, this care to be not restricted to injuries, but to include all that may be medically needed, including domiciliary visits In a degree, were the last-named item included in the program, it would relieve the hospitals and dispensaries of some of their overcrowding It would keep them for the unemployed unemployables, and for the actually poor and the destitute These groups are wards of local government anyway The class-group of employables in the W P A should get a personal medical service, which integrates the work of the private

medical practitioner who should be paid on a fee-basis for his service to the community When the doctor is not paid for this kind of work, he is twice taxed —once as a taxpaying citizen to support the W P A , and the second time, when he gives the money value of his medical service to these worthy people

The prophylactic and preventive health measures, properly the function of local health departments, must be coordinated in this work The private practitioner of medicine is one of the best agencies for delivering tested prophylaxis and preventive health precautions to his patient-clientele When medical service to the indigents is paid for by the community, and the private practitioner of medicine becomes the agent of the Health Department in delivering health safeguards and preventive measures to the patient-group for whom he will feel responsibility, then a truly fine working order will have become established, of benefit to the whole people For it seems almost axiomatic that when we lessen the incidence of disease in one group of the population, we thereby lessen the probability of occurrence in other groups of the public The entire community benefits

The medical problem of arranging this type of work, and allocating it, is a county medical society activity which should be utilized by government in the further development of this medical service

The county medical society has long been advocating the establishment of a central registration bureau where all indigents shall be registered, and from which they individually might get authorization through which either a clinic or a dispensary was obligated to deliver medical treatment to them Such authorization might be extended to any private medical practitioner who volunteered to do this work, on a prearranged fee-for-service basis, and deliver the required medical care from his office, or at the patient's home. We believe that thousands of dollars would thus be saved beyond the costs entailed in establishing such a registration bureau Were it established, very little additional force would be needed in utilizing it, to register the W P.A workers, and thus arrange for their general medical care.

The medical profession looks with approval upon the fine record of contributions made by the W P A toward useful projects in the health field Millions of medical, dental, and nursing treatments are on record This medical care comprised inoculations against scarlet fever, diphtheria, influenza, whooping cough, and smallpox Needed help was given toward maternity and infants' welfare, and in a long list of diseases and conditions, such as hookworm disease, heart disease, infantile paralysis, and tuberculosis In all it is a record we can contemplate with modest pride We of the medical profession fully recognize this as good work It is a contribution from the store-house of unused labor, embraced in the W P A which government has utilized for the benefit of the whole people In this work we find integrated the small private incomes of many competent doctors, nurses, and research-workers who were able to reach many people otherwise impossible for them to have served

There is one additional factor of immediate moment From the medical viewpoint we cannot ignore the prophylactic value of useful employment in general with reasonable wages as a reward A body adequately nourished naturally reduces the prevalence of physical disease Purposeful and useful occupation reduces the incidence of unhealthy mental states

Thus, useful work-projects, like those of the W P A , entirely apart from the specific medical projects, are in themselves a basic necessity for public health From the medical point of view, this is a responsibility of government to maintain

Finally, I bespeak for you the interest and concern of the medical profession The profession of medicine is expert in this field and you should call upon it for counsel and advice in planning developments in the health field The health of the worker, the conditions under which he lives and works, as well as plays, because he is a source of community wealth, naturally becomes a concern of the community government

The medical profession has repeatedly expressed its entire willingness to cooperate with the government to the fullest extent possible in keeping the wage-earner healthy, whether employed or not Such

is one of our highest functions In New York City, this is no mere wishful thinking, it has become an established fact Government and profession are working together purposefully As the need develops further evolutionary developments of plans will be brought about All this is being done without destroying private practice, and without establishing an additional bureaucracy to stand between the patient and his doctor To accomplish these desirable ends, I invite your further consideration

ON SEEKING A SECOND OPINION

An eminent man of medicine gave some good advice to a class of young medical graduates in Scotland recently, as reported in the *British Medical Journal* He is no less an authority than Sir John Fraser, KCVO, MC, MD, FRCSEd, Surgeon in His Majesty's Medical Household in Scotland, Regius Professor of Clinical Surgery, University of Edinburgh "I want to give you this piece of advice," he said, "it is based on personal experience" He went on

If you are in doubt or difficulty about a clinical problem never hesitate to ask the opinion of a colleague. One of the great pitfalls of medicine is the state which has been described as 'clinical staleness' It is an accurate and appropriate description, and here is what it implies You are concerned with the treatment of a case, things are not going as well as they should, and you feel dissatisfied and perhaps disheartened You know within yourself that the problem wants thinking out afresh, and yet your mind is so oriented by the influence of the original impressions that you are unwilling to make the new effort. You are suffering from clinical staleness, an affection to which every one of us is liable, and a malady of great significance both to you and to your patient If you are conscious of it I beg you not to hesitate, but at once to enlist the opinion of another He may not be as knowledgeable as you are, but he comes to the problem with a fresh mind, and, looking at things from a different and fresh angle, may give you most valuable help I know how difficult it may be to bring oneself to ask assistance from another, you feel that you are making confession of your own failure, and that you may prejudice yourself in the eyes of your patient and his friends I assure you that these are misapprehensions You are not belittling yourself, you are exhibiting a strength of mind which excites admiration and approval, and all my experience tells me that patients are invariably appreciative of this attitude, which says, 'I am uncertain and I want another opinion' Do not misunderstand me. This advice does not imply that you are not to know your own mind or to make your own judgments, the very reverse The advice is that, if, having done your best to arrive at a decision by all reasonable means, you are still uncertain about it, do not hesitate to ask the opinion of a colleague Choose him well, I agree, but it is very unusual to be 'let down' The right man knows the meaning of being given a confidence, and he also appreciates the significance of *esprit de corps*

WHAT THE TRAGEDY TEACHES

The blunder that released into the open market an untried elixir of sulfanilamide, with tragic results, furnishes, after all, observes the *New England Journal of Medicine*, only a more than usually spectacular example of what has been taking place for years under our present system of uncontrolled drug distribution Deaths and blindness are still continuing from the use of dinitrophenol, recklessly placed upon the market some years ago, deaths from liver damage have occurred as the result of cinchophen poisoning, acute and chronic poisoning results from the improper use of thyroid and radium preparations Still, such estimable publications as the self-styled "leading breakfast table newspaper of New England" encourage self-dosing with their indiscriminate acceptance of patent-medicine advertisements

The only remedy for this situation—a remedy that should be applied now, while our recent unhappy experience is fresh in our minds—is the enactment by Congress of an adequate and comprehensive national food and drug act This constitutes one of those instances in which a strong central control may be legitimately exercised

Dr Robert L Levy will speak at the New York Academy of Medicine on March 22 at 4 30 on 'The Diagnosis of Cardiac Diseases"

Preventive Medicine

How Intelligent are American High School and College Girls?

A Cross Section of a Girl's Thinking

B Liber, M D, Dr P H, *New York City*

A short time ago I read the following authoritative statements "In 1934 there were over 72,000 individuals in New York City alone having intelligence quotients lower than fifty It is estimated that there are at least 20,000 school children of defective intelligence in Greater New York Fourteen per cent of the residents of New York State—nearly two million persons—are *below the average without actually falling within the classification of feeblemindedness"*

At about the same time I happened to catch a radio presentation of the answers to questions addressed to many stenographers, typists, male and female employees in commercial offices, also "average" people belonging to the middle and employing classes, all of them newspaper readers None of them was able to answer any elementary question of recent or contemporary history or geography For instance, none of them knew how the United States had acquired Alaska, the Virgin Islands or the Philippines But all, without exception, answered promptly and correctly the quizzes concerning the baseball game Apparently reading is not enough It may misinform or distort the information It depends on *what one reads* and on what the writers write about.

Some highly cultured foreign-born parents—the father a medical man, the mother a dentist—felt a great discrepancy between themselves and their American born daughter of twenty, their tastes, preoccupations and aspirations, and hers She had graduated high school, read magazines, was fond of the radio, and went to movies They wanted to know whether she was mentally normal. To them she seemed deficient. But as she did not care to be examined, they brought me a batch of her correspondence, that is letters received by her from her friends As I began to read them, Alfred de Musset's *"A Quoi Rêvent les Jeunes Filles"* came to my mind but the comparison would be only a caricature I am publishing here—with the permission of everyone concerned—a few of the letters, the others being about the same

True, *the level is low* but these are typical, average, poorer, and wealthier, middle-class girls They are not feeble-minded They should be called *normal* Would they have been shop and factory working girls they might at least deal with or hint at working conditions and poverty and struggle in addition to whatever else would be of interest to them

Parents are not always good educators and the mere fact of their parenthood does not make them models of great intelligence But in this particular case there was no doubt that both the physician and the dentist were in all respects perfectly equipped and qualified to be splendid parents We do not know how far they would have been successful, but they had really never tried They admitted having *neglected* their child. They were too "busy"—as if living and rearing a child were not a business—and left her entirely in the hands of servants and under the influence of the school and of her friends Now they reap what they have sowed Do we not see the same thing in the families of the richest, even among those who have something else besides money to give or to impart to their children? Do you remember the father of the little hero in "Captains Courageous", in its movie version?

The question of raising the intelligence level of the people as a whole is related to social and economic conditions Not that it cannot be done, but it is a problem of vast implications and belongs to that part of *preventive medicine that touches the highest pinnacles of our science* But in many individual cases it is a matter of honest, dutiful, conscientious parenthood, and it can be solved.

It has been said and reiterated that a large percentage of our male population of military age has been found mentally much below the theoretically accepted adult age But if we change our idea of adult mentality, that is, if we lower our standards, those boys must be regarded as normal It is evidently the same with the young women, whether we like it or not.

Hello Mary! I know just what you'll say when you receive this letter "Well it's about time." But really, these two weeks I have been exceedingly busy I'll tell you later in this letter what with I'm sorry to hear that your

is one of our highest functions In New York City, this is no mere wishful thinking, it has become an established fact Government and profession are working together purposefully As the need develops further evolutionary developments of plans will be brought about All this is being done without destroying private practice, and without establishing an additional bureaucracy to stand between the patient and his doctor To accomplish these desirable ends, I invite your further consideration

have you received from Dorothy? Tell me in your next letter I wrote a long letter to you Write me now Oh, yes I'm crazy about the place we're going for our vacation There are about three fellows to every girl So that's keen

---

Dear Mary You requested an analysis, well here you go! You have a medium heavy pressure signifying that you are of a nature who has its full share of appetites and material interests Your wide margins show you have a good taste and a desire to spend money As your writing runs uphill, you are depressed about something, either health or some other worry your *t* shows your are persistent Your *r* shows you would be a safe person to tell a secret to Your open *o's* and *a's* show you are generous Your angular *m's* and *n's* signify the ambition and courage in the doing of some one thing Your *i* dots being comprised of dashes show you have a sense of humor You are normally affectionate. You like a caress and can give a thrilling one. Since the script is so refined I am sure the personality would be interesting, but I also find that some of the finest elements of character are not present. This is all With all good wishes for your luck and may your husband be blond and your children be as many as there are stars on the milky way

Your horoscope Born under the influence of Gemini Should marry someone born under Libra or Aquarius *Birth-stone* Emerald, Success in love. *Flower* Fleur-de-lis *Color* Yellow (brown, blue), red (rose, etc)

Your nature is inclined to be very serious, and affectionate and craves a quiet home life

With good luck.

Flanders Chain of Good Luck This letter has been sent to me so I am sending it to you Do not break the chain of good luck. Copy this in twenty-four hours and send it to five friends This chain has been started in Flanders and shall go round the world three times Do not burn it up or you will have bad luck. The fourth day after you send this letter you will have good luck. It is remarkable how this prediction has been fulfilled, so send this and four others Do not keep it in your home—Love and kisses

611 W 158 St

THE MEDICAL PROFESSION MUST BLAZE ITS OWN TRAIL

The time has come when we, of organized medicine, must assert ourselves and teach others that organized medicine will continue to care for the nation's sick as always We must shake our reticence and combat those misguided forces, or those who for a livelihood, would force upon the country socialized medicine We must adjust ourselves to changes in conditions and devise ways and means to meet these centralized forces Political and fraternal privileges for free medical care must be stopped. The low bracket income worker shall be cared for, medically, in accordance to his income and his choice The indigent, not always by his own choice, will, no doubt, be a part of our society He shall be cared for as always, and by the same token indigency shall cease to be glorified and encouraged as it has been for the past few years

The indigent, who expresses a desire for his own choice and who has been accustomed to his family physician should, within reasonable limit, have his own choice. There always will be those who express no desire and will be cared for by our municipal institutions, and properly so Let us think hard before we contract to sell our medical services in a competitive manner to any municipal or industrial organization

As Doctor Parran so ably stated, "You doctors must lift your eyes from the microscope and view through a telescope the mass medical problems of the community" We must cooperate in all community public health measures that are a benefit to society We must think for ourselves Can politicians, social workers and philanthropists devise the best method for us to care for the sick? We, ourselves, must decide on questions which are a detriment to organized medicine and work for their extermination, just as we have worked in the past against disease

We must impress, by various means, the fact that every doctor, old and young, owes a debt to his chosen profession and must fulfill his debt to his Medical Society, thereby protecting his own livelihood The physician must, and shall, give the best in himself and in others qualified, to the patient who shall have a free choice of his medical care The patient and doctors must not become numbers as in criminal institutions His rights shall not be taken from him by any centralizing force that sees nothing but an impartial statistical health report for the nation

—*President Harry C Guess, Medical Society of the County of Erie*

father is so ill I hope he has pulled out all right and is on his way to recovery I have not told your mother good bye, in fact I'm ashamed to say it, but I have not had a chance to see your mother But I will make it my business to see her before she leaves

About Dot, well she said she wrote you but did not get a reply I think it's because she sent it to your other address Kid, you surely are having the tough brakes But brace up May be when you settle down you'll be able to meet some nice friends Your last letter sure sounded down and out. I hope the answer to this one will be chucked just full of good news Scandal, if necessary Ha-ha! Just like a woman

Are you still going to school? Dot is planning going to summer school for advance I hope she does

Say, I got some new clothes Summer outfits, but the heck part of it is that I haven't been able to use any because it has been pouring almost every day Darn it!

Well, now to tell you what I have been doing to myself these last two weeks Not that you care to hear it, but nevertheless you're going to read it and I hope like it.

Excuse, have to answer phone. Oh! Nothing important. I thought it was my daily call from Joe.

Looking back into my diary at the date when your letter arrived I can relate to you my doings since then Hm—That's one good part of a diary, heh?

Wed—I went to Sherry's with mom. I forgot what they had. At nite I stayed in and read

Thu—Went downtown, I got an ensemble and few other things At nite was over my aunt's with my beloved

Fri—Nothing much. I stayed in. This day is always a busy day at home for us At nite mom had company So just fooled away the evening

Sat—In afternoon I walked to the tennis courts and back with Joe. At nite we went to the river together

Sunday—It rained all day and nite But I went out to Rosie's in afternoon We went to the park and played ball I had supper up there at nite Joe and I took a walk and then home. That's that

Monday—Was a terrible day I felt rotten. Nothing unusual It rained all day again Such weather! At nite I went to my aunt's and met Joe. Stayed till 11 p.m Another day

Tue—At noon went downtown with Lilly We had lunch and then went into the Diplomat At nite I stayed in and sewed. I made an ensemble It's right cute

Wed—In afternoon went to dancing school to rehearse. Going to have a recital At nite I read a story—I have forgotten which

Thu—I went downtown and got a dress, hose, etc. At nite met Joe again at my aunt's

Fri—Stayed in Had loads of little personal things to do At nite I listened to True Story Hour Do you ever listen to them? They are good Dot and I wouldn't miss them for anything Then the folks decided to go riding So we stopped by Dot and took her with us

Sat—Rained again Such a town! Everyone is disgusted with it. It didn't rain, it poured So I stayed in and sewed all day

My gosh, another page filled! I hope you're not asleep yet.

That nite I went to the Golden Pageant with Joe. You know what I mean. It sure was good.

Sunday—In afternoon Dot, Ruthie and I went to the Diplomat At nite went over to Joe for single reason that the folks wouldn't leave me home alone

Monday—I was a good girl for once and prepared supper I was planning on staying in but no, Dot called me up and I went to the Hotel. Dorothy did some singing there. At nite I went to dance rehearsal

Tues—Yesterday In morning I went down town and got some book, I forgot the title. In afternoon I played two hours of tennis for the first time this season. I played with Rosie. Sure love it. At nite I went to a bridge party And today I have to go to another rehearsal.

Well, thats' over with You're not a bit sorry, I know You were probably bored to death, but this is the only way I can let you know what I'm doing with myself As you see I have been quite on the go

Otherwise there is no news I see Dot only on weekends But soon we'll be together more. Swim, tennis, shows, outings, etc.

Every one of the bunch is well I'm going to have the gang up this Sunday afternoon. I wish you could be here with us Take an airplane and fly, kid! Bright suggestion. Heh? What?

This is enough boredom. I will not write on another sheet, that's all there is to it. Ta ta, old pal! I hope I get to see you sometimes in the near future Take care of yourself in the meantime. This comes from your pal

---

My Dear Mary I haven't received a letter from you for a long time. Why haven't you written a letter to me? Dorothy told me that she received many long letters from you. I have two other dresses at home. I have four new dresses and one for school. I think I shall write many letters to you, every Monday I will write to you next week. I went to the show at the theater It was a very good show Next week will be a good picture. It will be pep and pep and I know it will be very funny There will be many soldiers in it. I will tell you all about it. How are your mother and father? Tell me in your next letter I am very glad that you have a good time. I was very much surprised to know that you sent Dorothy a small cabinet It is very cute. I like it very much I know you had one like it. I want to tell you that I have a red dress but it was too big and my mother sent it back and I got one like the red one. I draw my two dresses to you See picture. (Illustration, drawing)

Here is my tan and black dress for Easter And I got a scarf with it (Another drawing)

Dorothy told me she likes my blue dress best It is very pretty I wish you would see it I am wearing it. I hope my family will go to California this summer and perhaps my father will buy a new Packard car How many letters

meetings at Capitol Hill, with music, banners and all other paraphernalia necessary to impress the Legislators that the Chiropractic Bill must pass"

Let no one imagine that the projected chiropractic demonstration is just a circus Like all elective bodies, the Legislature is responsive to *vox populi* An articulate minority is more impressive than a silent majority, even when the latter is right

The chiropractors base their case on the right of their followers to enjoy the healing methods in which they have faith Medicine is perfectly willing to concede this right. It merely holds that everyone who seeks to treat the sick, by whatever method, should first be thoroughly trained in the basic medical sciences

The trouble with all the chiropractic bills which have heretofore been introduced is that they pay more attention to the interests of chiropractors and the chiropractic schools than to the public health Not one of them has ever provided for *universal examination* of applicants on the terms which osteopaths and physicians must meet

This is an essential difference between medicine and chiropractic While medicine has always sought to elevate its educational standards, chiropractic is satisfied with the minimum with which it can "get by" There are provisions in all its bills for the licensing of practitioners with no formal training whatsoever

It is to the credit of New York State legislators that heretofore they have resisted all attempts to break down the standards of medical practice by the licensure of untrained sectarian practitioners The profession should bolster up this determination by prompt action to counteract the possible effects of a lively chiropractic demonstration

From the viewpoint of practical politics, legislators have nothing to gain from capitulation to chiropractic. If the latter can muster 50,000 friends, medicine can rally 5,000,000

Above all, however, physicians should impress their representatives at Albany with the danger to public health which a chiropractic victory would entail The sick have no security unless thorough instruction in the basic sciences is obligatory upon all aspirants to the healing arts

---

The Orderly Development of Medical Policy

The policy of organized medicine in our state is enunciated by the direct action of our House of Delegates after debate, due deliberation, and thoughtful consideration

Recently, in the *Journal of the American Medical Association,* there appeared an inspiring and informative editorial This was provocative of activity in the constituent county medical societies It gave expression to the adopted policy of the Board of Trustees of the A M A, and indicated quite clearly that initiative in planning and developing schemes to overcome financial barriers which stand as obstacles in the way of bringing high quality medical care to those sectors of the public needing it, should originate and start into being within the domain of the county society

Some county societies thereupon immediately set about to debate and adopt principles and resolutions They also almost simultaneously asked, by circularizing other units of organized medicine to adopt their ideas, and requested that endorsement be given them for their conceptions by the State Council

We were instructed by the Council at its February meeting to inform our members by publishing an item to indicate that the county societies "may initiate schemes that are applicable within their own counties, but that all resolutions concerned with action beyond the limits of the county should be introduced at the ensuing meeting of our House of Delegates by the county delegations"

Naturally, upon matters concerned with problems within the boundaries of

Time and Money Wasted

There is talk in Washington of creating a commission to study compulsory health insurance, with particular reference to European experience For more reasons than one, this would be time and money wasted

All the material necessary to pass judgment on obligatory sickness insurance is already available—in data collected by the American Medical Association, in various foundations' reports and above all in international vital statistics

A new commission would merely rehash facts that organized medicine and other bodies have already assembled Unless it were familiar with medical conditions prior to the adoption of compulsory insurance in the countries studied, it could not evaluate accurately either the quality or costs of present-day service

It should be obvious that medical training and experience are necessary to study a medical system properly and judge its worth In Washington, however, there is a tendency to place such tasks in the hands of laymen The research committee of the Social Security Board is an example There is no reason to believe that the medical profession would fare any better on a commission to investigate compulsory sickness insurance Without adequate medical representation, an accurate appraisal is not to be expected

From the taxpayer's viewpoint, the projected investigation of sickness insurance would be a waste of money The country is in no condition to undertake the enormous costs of another bureaucracy at this time Business and labor are having a hard job adjusting themselves to the payroll taxes for old age and unemployment New taxes for sickness insurance would just about upset the applecart Besides, there is already uneasiness over the reserve fund piling up under the present Social Security Law

The country has had too many commissions gather facts *at the taxpayer's expense* only to have their reports moulder away, forgotten and unused With medical opposition to compulsory sickness insurance unabated and less controversial reforms in view, why start another futile study?

Chiropractic on the March

According to a bulletin issued by the American Bureau of Chiropractic, the chiropractors of this state are preparing the biggest demonstration in their history to dazzle the Legislature into granting them recognition "Der Tag" has not yet been announced, but when it dawns Albany will be invaded by over 25,000 lay friends of spinal manipulation, "who will parade and conduct mass

We shall again refer to the details of the program and arrangements Suffice for the time to indicate these names which guarantee the quality of the scientific meeting

Obviously, the meeting should be well-attended Our officers and committeemen have labored in our interests Ours should be the task to show appreciation of their efforts Only by attendance and by taking an active part in the meetings, both general and sectional, can the officers and committeemen know that they have worked purposefully

New York Meeting of American College of Physicians

Between April 4 and 8, there will be held at the Waldorf-Astoria Hotel, in New York City, the twenty-second annual session of the American College of Physicians It is with a sense of pride that we welcome this group of great clinicians to New York In the last issue was an announcement covering a general schedule which made up a postgraduate week of internal medicine (page xii)

The clinical facilities of the City will be on display The educational institutions will contribute, and the genial hospitality of New York will all combine to make the College welcome

The Medical Society of the State of New York here joins with its five component county medical societies of New York City, in extending to the American College of Physicians, cordial greetings, and welcome to our state

Tuberculosis, Benign, and Malignant

Pulmonary tuberculosis is still an important factor in the mortality rate, despite the enormous strides which have been made from both the preventive and therapeutic standpoint While the former must remain the ultimate goal in our management of this disease, the manner in which a given case of tuberculosis should be treated is the immediate concern of both physician and patient

It is known that pulmonary phthisis does not always present the same clinical pictures in all instances How to determine clinically which case requires active therapy in order to ward off a fatal outcome and which one will run a benign course is a matter of moment Ornstein, Ulmar, and Dittler presented a clinical classification of pulmonary tuberculosis[1] which was somewhat confusing in that they laid stress upon the pathologic terminology of the disease Similarly the National Tuberculosis Classification depends upon the quantitative element of the lesion,[2] but the Association and other workers in this field feel that a qualitative element also exists which may have a bearing upon prognosis and therapy but state that it is difficult to evaluate

Taylor,[3] on the other hand, considers the qualitative component as the dominant factor in attempting a classification of pulmonary tuberculosis, and remarks that "classifications depending upon autopsy material, while valuable, give the terminal stage, omitting information as to progression or regression" By means of serial roentgen studies Taylor asserts that the clinical manifestations of the disease can be divided into two groups, benign and malignant The benign lesions do not shorten life They frequently assume a symtom complex which may easily be attributed to chronic bronchitis or asthma, and the acute phase is transient From the standpoint of preventive medicine, sufferers from this variety of tuberculosis do not spread the disease The lesion is readily recognizable by serial roentgen examinations and it should be treated medically

The malignant types always exhibit cavities in the chest and have a high mortality rate,[4] unless treated surgically Active measures such as pneumothorax, pneumonolysis, and thoracoplasty are in-

a county, that unit of organized medicine is fully competent Under the authority of the A M A , to which reference has been made above, the county society can assume responsibility and leadership It can go forward in actual practically applied experimentation, and institute plans and schemes in its own medical economic field

This authorization from national headquarters can however hardly be held logically to imply that as soon as one of our county societies has thought-out a set of principles and propositions that it is incumbent upon it to at once undertake to advance its ideas to the national organization Progress is not made that way Obviously there should be time for study Certainly other and additional county societies should take the ideas, principles, and propositions under consideration and inquiry

In our House of Delegates, the whole state is represented The different sections of the state, the urban and the rural, the manufacturing and the farming sections, the practical general practitioner, the surgeon, the health departmental workers, and the institutional research-worker, all find representation Here and only here, can delegations from all the component units of the State Society meet to debate and deliberate

From the actions of the House of Delegates there results a statement of policy for our State

The action of our Council in asking publicity for this item lies therein that we stress these facts By this publication of Council opinion, we invite county delegations to formulate their plans, arrange their proposals as to state-wide policy, and bring them to our House of Delegates for deliberate consideration

Dependent upon ensuing actions and decisions taken in our House of Delegates, matters implying a nation-wide scope would naturally be brought for national consideration to the House of Delegates of the A M.A

One additional item needs stress It is of a negative character The circularization of the profession by a county society group asking support should be superseded by the more logical request for consideration and opinion *after* deliberation Asking support is too much tinged with the color of partisanship and pride of authorship The ideas and suggestions evolved by a given county society should have such inherent worth, that when studied in calm philosophic detachment, their intellectual appeal will automatically bring them support

Emotional attachments to "brain children," hastily conceived, too often show an inverse proportional allure to logic. In the development of questions of State policy, more study and less speed in action brings to the question more light In the end a safer, sounder declaration of policy will result

Our Annual Meeting

The time set for our annual meeting is decided upon so far in advance that we are wont to experience a sensation of astonishment when suddenly confronted with the realization that the date set is almost upon us It is therefore proper that we comment upon the occasion which, during the week of May 9, will mark another milestone on the path which our State Society will then have passed

In the information at hand, there is evidence of careful arrangement and thoughtful development of a program that shall show medical scientific advancement and progress, as well as features of inherent educational value to the profession itself as well as the public it serves

On the programs of the general sessions the country at large is contributing outstanding authorities, among whom Doctors Irving Abell, Charles A Gordon, George R Cowgill, Frank H Lahey, Louis A Buie, Edward A Stricker, and Russell W Bunting will be noted

From across the sea, England contributes Mr Victor E Negus of London, an eminent surgeon in otolaryngology

longer plowing a lonely furrow, a better result would be achieved than by socialized medicine" (Italics ours)

"LANGUAGE IS APPARENTLY A SWORD which cuts both ways With its help man can conquer the unknown, with it he can grievously wound himself Do not try to bring everything into line on principle, first bring into line what is breaking down Clear the mind of dogma about individualism and socialism No one wants 'socialization' as such—verbalism cannot be eaten —one wants for himself and his fellows a good job, good food, a good house to live in, a car and a chance to send his children to high school or college. To obtain these things it may be necessary to fight All right Let us fight. But let the fight be on the real situation Let us see clearly a possibility of success And let it be known that we are going after adequate goods, services, jobs, rather than after a 'classless society' or a 'co-operative commonwealth'" —Stuart Chase, "The Tyranny of Words"

"BORROWING A LEAF FROM THE Chinese, American public health officials are striving more and more to keep people from getting sick, rather than treating them after they do Both the San Francisco and the New York World Fairs will illustrate this trend most graphically The whole field of disease will be dramatized at the health show featuring the New York Exposition

'Fair leaders have recognized that health is the most important topic in the world They will present in striking form mankind's war on cancer, tuberculosis, heart disease, and a half hundred other major scourges Science's strides in battling these death-dealing forces will be shown Methods of research and experiment will be explained

"This idea of familiarizing the public with the fundamentals of health undoubtedly will spread Dramatization of the problem will make the ultimate conquest of disease easier"—Editorial, *Los Angeles Times,* January 10

HUMAN BITES

In savage fist fighting men sometimes bite each other, or a fist is cut and lacerated on the opponent's teeth The result may be fatal, for the human mouth contains infectious bacteria. Dr William H Prioleau, of Charleston, S C, remarks in the *Journal of the South Carolina Medical Association* that the wound not infrequently looks innocent and as if it would heal with ordinary surgical measures However, more often than not a miserable type of infection sets in, involving neighboring structures and generally extending up the lymphatics The hand, the site most commonly affected, frequently suffers permanent damage, life itself may be lost. Apparently the human mouth is the dirtiest of all mouths The organisms involved are usually described as anaerobic streptococci, and spirilla and fusiform bacilli of the Vincent group An immediate cauterization or debridement would seem advisable, however, these cases are not always seen just after the injury, also such a procedure would often result in serious damage to the hand

Some years ago Dr T M. Lowry investigated the treatment of these cases at the Beekman Street Hospital, New York City, and found that the methods of treatment were most diverse and the results generally unsatisfactory *Ann Surg,* 104 1103, 1926) He worked out the following method of treatment which has proven satisfactory All wounds are swabbed out with fuming nitric acid and immediately flushed with cold water Wet dressings are applied No wound is sutured Nitric acid is applied even when tendons are exposed and joints opened No tetanus antitoxin is given No anesthesia is used The same treatment is applied even in cases of several days standing

In the treatment of fifty-five cases, in ninety-seven per cent the results are recorded as good

There is no question but that these cases must be dealt with drastically if we are to prevent serious consequences Puncture wounds must be converted into open wounds Thorough cleansing must be done The application of nitric acid seems radical, but apparently is justified, as judged by the author's results, especially so as he reports that it does not permanently damage tendons or joints A wet dressing provides more adequate drainage. It would seem better to hospitalize the patient where practicable.

dicated in the treatment of these cases The increased use of collapse therapy necessitates a means for the proper selection of cases, and only by a series of roentgen studies over a minimum period of three months can a differentiation be established between the benign and malignant forms of pulmonary tuberculosis

Nutrition and Hearing

Currently, the *Journal of the American Medical Association* is publishing a series of articles concerning the present status of the pharmacology of the vitamins Within a comparatively short time, the medical profession has become aware of the role which the vitamins play in the maintenance of health While specific information is available for certain of them, a great number of unsubstantiated claims are made for others

It is of significance, therefor, that chronic progressive deafness should be studied from a nutritional standpoint The theory that a large number of cases of progressive loss in hearing were the result of metabolic disorders has been advanced by several investigators Selfridge,[1] however, studied in detail the dietary histories of his patients and correlated them with the findings of the chemical constituents in the blood Where a deficiency in vitamin C is evident, and there is an insufficient ingestion of calcium and phosphorus, disturbances in the osseous labyrinthine capsule may occur

He finds that in those patients wherein the hearing loss is in the early stage, a proper correction of the errors in diet so as to include foods rich in vitamin B, coupled with the administration of vitamin B 1, will restore most of the hearing Where there is a reduction in hearing acuity of twenty-five per cent or more, the vitamin B 2 complex was more effective Selfridge realizes that many other factors enter into the production of a chronic progressive deafness and that no one plan of attack can be formulated until more is known about the interrelationship between the endocrine glands, electrolytes, and the vitamins Nevertheless, the report and the hypothesis advanced by the author are provocative since changes in bone structure and in neural tissue do occur as the result of a vitamin deficiency, and such alterations are definitely known to be the cause of a progressive loss in hearing

1 Selfridge, G *Annals Otol, Rhinol, and Laryngol*, 46 825, 1937

CURRENT COMMENT

"The Future of the Family Doctor" is again considered, this time by Lord Horder, in an address before a London division of the British Medical Association The *J A M A* of February 26, through its regular correspondent, discusses Lord Horder's address at some length, to wit "Lord Horder said that all was not well with him (the family doctor) He found himself obstructed in his work, which was to some extent discredited He had lost caste, he was discouraged, and he felt insecure about his own future and the future of the profession The actual position was not quite so bad as this bald summary suggested, but each of the statements were true, some of them were true of all physicians and all of them were true of some Perhaps the thing that bothered the family doctor most of all was the sense of insecurity, the feeling that he did not fit into the scheme of things, that he had not found his proper niche

"Lord Horder believed that the family doctor was capable of being the most valuable member that society possessed. Society was aware of that and it was because the doctor stood so high in public esteem that, when fiction degraded his standing, the story became a 'best-seller' If coordination of medical services was to be achieved, it could be done in one of two ways As basic principles on which physicians were agreed preventive medicine and curative medicine should be available for all members of the community, that the family doctor was indispensable for securing this, that free choice of doctor and continuity of medical care must be maintained, that the doctor should have easy access to institutional facilities and to consultant and specialist help, that there should be means of making contact with the family as a unit both when fit and when any member was sick, and that the doctor should be encouraged and helped to maintain this efficiency after qualification. *With the doctor no*

pensive radios, extravagant house-furnishings and expensive clothing and frequent amusements, complaining how poor they are when the family physician, the obstetrician, the surgeon, the nurse, or the pharmacist is a dire necessity

At the moment, public opinion is not the stable intelligent sheet-anchor of character upon which the nation has depended for its sound historic decisions Two or three generations of increasing proportions of "spoiled children" have furnished influences unfortunate for the quality of personalities and group opinions The desire and planning for what they *should* have is largely replaced by the desire for extravagant indulgences many of which they should *not* have. A significant mental tangent of the times is that many persons today measure our superiority over our ancestors by the luxury which we have and they had not. The truth is that we should bow low, in spirit, in recognition of their thought, industry, and devotion to ideals that brought us these luxuries Moreover we should be ashamed that we have permitted these luxuries to so soften us mentally and physically as to convert our straight and sturdy American spines into soft affairs with all kinds of curvatures

Certain of the lower strata of politicians would be pleased to regiment medicine under any kind of law, Compulsory Health Insurance, or otherwise. The development of leaders who can cope with the world-tendency toward regimentation of patients and physicians and dividing the spoils among those who do *not* do the work, will require medical statesmanship of a high order

It is evident that great numbers of our citizens lack intelligent judgment in regard to medical and health affairs, and it becomes one of our duties as physicians to furnish them with information and guidance of thought processes, so that they may think along with us for their own benefit and that of their children and grandchildren

The poet Ovid, a contemporary of Jesus Christ wrote "Too late is the medicine prepared when the disease has gained strength by long delay" And yet after 1900 years the people still "long delay"

Seneca the great Roman philosopher (B C 3—A D 65) wrote "It is part of the cure to wish to be cured" How tardily oftentimes comes the wish!

The education of the public to seek treatment early in disease, immediately after injury, and to prevent disease by all available immunizations and by modern hygiene, is our most important and most difficult task In general the public is so ignorant and they think they know so much! The future of medicine depends to a large extent upon widespread education of the public They are ready for it—for now they are health conscious

Individual physicians could have a large influence if we could count on all giving a certain amount of time each day to wise and accurate education of the public about health matters and preventive medicine Other points we should teach are when to seek treatment and its value compared with fancy clothing, extravagant furniture, radios, automobiles, and other gratifying unnecessaries

However organized medicine *can* take up this work distributing medical and health intelligence to a larger audience and perhaps in more studiedly effective ways This we conclude is one of our tremendous tasks and necessary People are pitifully ignorant, indifferent, and really asleep to needs that we know are enormously desirable

Are we prepared to do this? We should be and can be. Perhaps we should next consider how our own education, training, and qualifications may influence the future of medicine!

The background furnished by the home of our boyhood or girlhood is an important element. Were we trained to be diligent, unselfish, thoughtful for others, and was our interest directed toward sound and constructive considerations? Or was the doctrine of self-expression invoked—in other words, "Don't lets bother about him?" It makes a difference! Even in humblest homes we have seen admirable backgrounds In all grades of luxury or lack of it occur the cold, sharp spirit of commercialism and nothing else This is *not* the ideal background for the embryonic medical man Especially as such homes prefer superficial and unstable amusements to gratifying accomplishments

Premedical education is an important phase of our preparation. Because of the prevalence of science in the studies and training in medical colleges the premedical education should be generously mixed with language, literature, history, physiography, and philosophy We must understand people

Society Activities

THE FUTURE OF MEDICINE

Presidential Address

CHARLES H GOODRICH, M D, *Brooklyn*

One of the most disquieting phenomena of recent years has been the shift from reluctance to willingness and even eagerness to accept medical relief at government expense on the part of many of our people This changed viewpoint is cited by some as a conspicuous achievement We regard it as a serious menace to the morale of the American people. This is an outstanding reason why we should discuss constructively the Future of Medicine

In Shakespeare's "The Tempest," (Act II) the King of Naples remarks to one of his courtiers stranded with him after shipwreck on an island

"You rub the sore
When you should bring the plaster"

As we begin and early proceed with utmost frankness you may recall this quotation However, later in our talk we hope to convince you of available "plasters"

"Future" in its present use means the period of years embraced in the expected life span of any human beings living today —perhaps fifty to eighty years

"Medicine" is a form of service rendered to the people of the State or Country by licensed physicians (This service is often supplemented by dentists, hospitals, clinics, local county and state departments, and various voluntary lay health and welfare agencies)

These definitions make the relation of physician and patient and the furnishing of the supplemental help when needed, sound like a simple practical formula for the preservation and restoration of health *Per contra* it is most complex And some people are trying mightily to make it more complex.

Truly the future of medicine depends upon the working together or in conflict of many diverse matters and circumstances, many of which seem unconnected with the practice of medicine and the relief of human suffering If we are to remain a Republic and a Democracy, from which we seem to be drifting very rapidly at this time, the future of medicine will depend upon the financial condition of the nation, the economic mentality of the people and their leaders, and public opinion regarding the methods of delivery of medical service.

The financial condition of the nation is bad just now and promises to be for a time. It is not because we have borrowed so much money and taxed the people so elaborately Loans can be paid by producers and taxes can be reduced if the government economizes What is discouraging to every earnest citizen who must earn his living by working, is that much of our spending purchases so little value for the nation that it is truly lost. And yet the loans must be paid and taxes levied for such expenditures—based upon what principle? In other words, our people have rapidly diminishing financial resources

The financial or economic mentality of the people has suffered degenerative changes Medical care is one of the necessities of life. (This seems proven by the desperation with which many sick persons desire the physician when they are in severe pain or prostrated by illness) Medical care steadily becomes *more expensive* to deliver because of increasing costs of education, research, new discoveries and inventions The majority of our people do not weigh values with practical intelligence. They desire much money to buy many things, many of them fanciful and merely luxurious They do not save for the inevitable emergencies They think it a bore to provide for the necessities of life They wish these given to them or purchasable very cheaply They buy unlimited drinks and foolish foods at extravagant prices—but neglect real nutrition Medical service is a necessity but they do not *wish* to be ill If they are it is somebody's fault and relief should come to them at little or no cost Yet they want the best! They will mortgage next two years salary to buy unnecessary automobiles, ex-

Read before the Broome County Medical Society, Binghamton, February 8, 1938

fluence, called to consult one of our associates while we were on vacation It happened to be Saturday noon As he mounted the steps the Doctor, golf equipment in hand, stepped out of the door and closed it. The patient stated his errand The Doctor replied "This is my afternoon for golf—my next office hour will be Monday afternoon Sorry not to be able to see you" The patient has rehearsed this story of neglect scores of times and often refers to our staff as more golfers than physicians If our traditional reputation for selflessness and self-sacrifice is to be maintained we should avoid creating the impression that we care more for our play than for the comfort or welfare of our patients Also here might be considered our conduct in hours of relaxation especially in public places

The Future of Medicine will in a measure depend on our possessing competent minds for business relations Each physician should fix standard fees for his work, based on time consumed and skill attained These should be adhered to except when the physician, with a larger sense of justice and humanics than the merchant, chooses to modify them The tendency to create fee schedules, regardless of a physician's known capacity and investment, is unfortunate for the people and their physicians Necessary as this may be as protection for physicians in some instances of mass medical service, much of the remuneration which he really earns often nestles in the pockets of those who do nothing for the patient

A larger distribution of a well-rounded ethical development may help to determine the future of medicine. Have we done our best? Many have unquestionably What proportion of us are really interested? Why not discuss ethics more frequently in our meetings? How many of us are frequent students of the code *created by ourselves?*

Thoughtful adjustments of ourselves to circumstances and conditions in our community and state will undoubtedly affect the future of medicine An individual cannot make over the community Adjustment will make him more influential in assisting others to bring about desirable changes and improvements A county society can provide leadership that will organize its cohesive elements into community efforts so vast and valuable as to be welcomed by all thinking people and assure our place in the future of medicine. Broome County Society is a grand example of what can be done by alert initiative, considerate thought and vitalized action

* * *

The Medical Society of the State of New York is thoroughly alive to the needs upon which are predicated an abounding future for medicine comparable in quality and distribution to other resultants of civilization and intelligent human endeavor What are the evidences?

I

Our relations with State officials and State Departments are cordial and mutual cooperation has proven how clearly all understand that this Society and the Departments of Health, Welfare, Education and Mental Hygiene are elements of importance of the same great endeavor, the best health and welfare interests of the people of the State

We have made plain to the Health Departments our desire to take part in a complete immunization program When invited to talk with them at Saratoga in June, we asked their aid in our program of preventive medicine The response has been cordial and telling Read what "Doctor Jones" says in *Health News*, July, 1937

At the Saratoga Conference we suggested that a joint committee of the Health Department and State Society make a two day survey of the Vaughan method of "Intensive Case Finding in Tuberculosis" (See *Jour Amer Med Assn*, September 4, 1937) in Detroit Cordially adopted, and the report of that visit with added surveys suggested by Dr Vaughan, at Battle Creek and Oakland County to study intensive modern health methods (with ample financial backing) will tend to increase cooperation and results in health work. Throughout recent months the Commissioner and his deputies have been most helpful and they fully understand that we desire to have every member of the State Society to be deputy health officers interested in our common objectives everywhere. You all know the joint endeavors in Pneumonia Control and how essentially the Health Department has helped us to begin a thoroughgoing campaign which must last long to be effective but which has already made a perceptible dent in mortality

as *people* first, as variable anatomical and physiological defectives later Our intellectual grasp of their mental dimensions, coloring, agility, and accuracy is an important element in our diagnosis, prognosis, and treatment How much cooperation can we expect? How much must we supplement it? This sense of perception depends upon our foundation of premedical education

Every opportunity for a well-rounded medical education is available in most medical schools of the first grade There are differences in methods of teaching and training More practical work is offered in some than in others However, in the main, enough is afforded to keep the student very busy for four years and very little time is wasted Speed and quantity are emphasized in some schools whereas in others, a deliberate, studious, time-consuming approach to every problem is taught. As is usual the middle of the road is probably the desirable place A very important element in medical education is the daily contact of teacher and student and the example and absorption of personal spiritual ideals which flavor a physician's service to human beings These flavors may be stimulating or depressing or indifferent. It is a great responsibility to be a teacher of medicine or a Doctor of Medicine! This transcends the material structures upon which we must primarily concentrate our attention!

During the formative years we develop certain aims and ambitions, determine character, and adopt certain moral principles The future of medicine may well depend considerably upon the quality of these developments in the young men and women of today, and after they have graduated from medical school we older fellows, with whom they must associate, have thrust upon us the responsibilities of influence previously devolving upon the college faculty How much are we doing to elevate standards of practice among younger men, so that each generation is more competent mentally, physically, scientifically, and spiritually than the last? Success lags in a family or profession where each generation fails to improve upon its predecessor! We must consciously and deliberately exert influences to improve the ambitious character and principles of our successors This is not enough, we must so conduct our lives as to render our *unconscious* influences a potent force in the professional heritage. For whether we will or no, unconscious influences, vast in extent, are ever flowing out unbidden from one's life upon society and over children which largely shape the destinies of our fellowmen Horace Bushnell talked about this eloquently over a century ago He declared that it is impossible to live at all and escape responsibility for these influences He stated that Paul of Tarsus moved the world more "by what he *was* than by what he *did*" He "fought the good fight" because "he kept the faith" Thus it may be very well for us to remember that in the future of medicine many things may depend upon our ambitions, character and moral principles If these are right, our unconscious influences will flow forth unbidden so that in community service as specialized citizens with remarkable knowledge and skill, our success as leaders may be evermore dependent on what we *are* than on what we *do*, "however mighty and effective the doings"

Our conscious and unconscious influences will alike be determined in large measure by the habits of thought and action which we develop as we study and work and play Walter Duranty recently said "the trouble with most people is that they think with their hopes or fears or wishes rather than with their minds" To think with our minds we must differentiate between the values of facts, material and historic, sentiment and emotion, and the reactions likely to be aroused by our thoughts expressed Thus we must make our habits of thought sound and true We must marshal our facts, place them in order, demonstrate their truth, and produce them with all proper sentiment, but without elaborate emotion for this may distort the truth Our professional and personal actions must be consistent with our studies and thoughts, and be worthy examples for our fellows to emulate We must live to work, to accomplish physical and mental results needed and sought for by our people. We must habituate ourselves to rest sufficient for mental and physical refreshment, and indulge in physical recreation to keep our bodies in desirable conditions of health Play should not be or appear to be an object in life which will exclude necessary work or subject ourselves or our profession to sharp criticism One of our patients, a man of great generosity and in-

because of the rare wisdom and journalistic experience of its Director, Mr Dwight Anderson, who gained sympathetic understanding of the spirit of American Medicine when for several years he directed publicity for the National Tuberculosis Association He has also a clear understanding of how the layman and especially the critical layman will react to our pronouncements and many of these have been shorn of their asperities by his blue pencil without losing vital force. He is a very modest gentleman who attributes a large measure of the success of the Bureau to the earnest cooperation of the officers and committee under whom he has served The Council Committee of the current year has been the Chairman, Dr Guy Carpenter, Dr Terry Townsend, who was Chairman last year, and Dr Thurston Welton, the Editor of the *American Journal of Surgery* The President and Secretary serve ex-officio The Council itself receives a report monthly and is in executive control of the Bureau's policies The leading activities of the Bureau are

(a) To keep our members informed of developments, political, social, and economic which affect physicians or those in which *we should be interested*

(b) To help us inform the public, in language they will understand, those facts, features, advances and conflicts of medicine which make for change—medicine being of supreme importance as a service to the people.

(c) To educate the public to understand what the physician can do for them, by informing them accurately, as occasion arises, concerning the preservation of health and the prevention and cure of disease. For this purpose excerpts from scientific articles, from addresses upon quasi-scientific subjects, from health propaganda are carefully selected and under the authoritative announcement of an officer, the Council, a Committee, or the Society as a whole, forwarded to the daily or weekly press of the State as releases Sometimes such releases are mailed to outstanding lay citizens who are known to be especially interested in health problems

Another interesting development has been the forwarding to the County Societies of Speakers' Service Bulletins furnishing outlines of addresses suggested for local or regional use by County Society speakers In some of these a sample address is furnished for use in whole or in part in case of emergencies of time

As presently managed with the utmost economy consistent with efficiency we are probably distributing to our members through this Bureau many times the value which we spend, besides transmitting to the public a clearer understanding of the problems and spirit of the profession

Among the extensive publicizing of almost every other work and social effort in the world *our* offerings are very modest and suitably restrained Carefully guarded and enlarged they may well become a tremendous force in improving the future of medicine for the people and the profession

So after this array of one-sided arguments, personal philosophy, and official records, what can we conclude?

We find that the future of medicine is trying to be born biologically of a multitude of parents The potency of the cosmo-philosophico-scientifico-politico "genes" must vary! Is there any indication at this stage of development of what "genes" will predominate? Who can say?

However, if we physicians can be exceptionally intellectual and use our intellects aright, if we can be skillful, certain, and proud of our powers while spiritually and joyfully dedicating these qualities to service to people, if we can educate a comprehending people to *understand* their needs and *prefer* them to the *frills* of life, and if we as a nation can maintain Governments whose interests in the health of its citizens commands them to the care of the independent qualified general practitioner and qualified specialists, united for the general good, there need be no fear for the Future of Medicine

---

The American Association of Industrial Physicians and Surgeons will meet concurrently with the Midwest Conference on Occupational Diseases at the Palmer House in Chicago on June 6-9

The Japanese have started a popular "keep fit" movement, and it is figured that 10,000,000 are taking part in it. Health examinations form an important preliminary

We are doing our part in Syphilis Control The Legislature has created a Cancer Commission now almost ready to report. The Governor invited us to name candidates for medical posts in this commission

Our Council has a grand committee whose duties are the cooperative relationships with Health and Welfare Department of State and cooperative relationships with State and Federal Governments Several important results of their intensive activities will soon be reported and acted upon by the Council to House of Delegates

From the date of the Secretaries Conference in October we have been in touch with the Educational Department and realize how earnestly they desire our suggestions and help Several ancient errors (in words more than in deeds) have been deleted with mutual satisfaction The Educational Department has *no* desire to compete with us in the Practice of Medicine!

II

To how great a degree our program of Preventive Medicine will contribute to the future of medicine depends upon our membership and how great an interest has been aroused Certainly we have had the unrestrained and cordial help of the officers and Council, the Journal Management Committee, the Secretary, the Public Relations Bureau, the District Branches at their meetings, and the County Societies visited We steadfastly believe that a thoroughgoing campaign along this line for a decade or so may be answers to many questions which people and groups and governments are asking We have called attention (NEW YORK STATE JOURNAL OF MEDICINE, January 15, 1938) to the potential by-products of Periodic Health Examinations as alone sufficiently rewarding A number of lay audiences have been addressed besides two Woman's Auxiliary Meetings

III

Postgraduate Medical Education has for some years been an administrative feature of our Society As conducted by Dr Farmer's Committee it has provided valuable refresher courses to physicians residing in localities remote from large medical centers This activity has been continued this year as much as before and many local efforts in Postgraduate Medical Education are well conducted by County Societies. This work greatly enlarged could have considerable effect upon the future of medicine.

IV

Our House of Delegates at Rochester in May 1937 ordered the appointment of a Special Committee on Matters Pertaining to Medical Care in the State of New York Its duties specified are (a) to establish a working definition of the term "Adequate Medical Care" and (b) to formulate principals and proposals for a State Health Policy

We have been fortunate in securing the faithful, enthusiastic services of our especially talented informed, state-wide representative committee under the leadership of Dr Walter W Mott of Westchester County They are preparing a report which is already thrilling in its capacity and clarity, and which will unquestionably offer masterly suggestions for the consideration of our membership and through you all to the House of Delegates Look for this report when it comes in April and be sure that the House of Delegates know how your membership think about it Out of this Committee's work amplified by the focussed wisdom of our fifteen thousand members represented in our deliberative body there may develop an example in State Health policy worthy of emulation by some sister States All of this may well influence the future of medicine in this beloved Country of ours

V

Through the joint efforts of the Journal Management Committee, checked and instructed by the Council and the extraordinarily energetic and competent publisher, our NEW YORK STATE JOURNAL OF MEDICINE has become one of the three best State Journals in this country Some of us think it the best! This, if maintained as now and with further enlargement and improvement will be a powerful influence for the good of our State and its neighbors in the future of medicine.

VI

Our most modern effective force for broad understanding of modern medicine and its spirit and aspirations is the Bureau of Public Relations This is made possible

or insurance carrier, and authorization obtained for such treatment, together with agreement on the fee to be charged Except under very unusual circumstances, only a surgeon thoroughly qualified in the diagnosis and treatment of hernia and experienced in the injection treatment is qualified to render such treatment.

IMPARTIAL EXPERTS—If the county society has not already sent to this office a list of thoroughly experienced physicians qualified to act as impartial experts under Section 13 (d), they will please do so at once.

Any additions to or changes in lists already submitted should be sent to the undersigned for transmission to the Division of Workmen's Compensation of the Department of Labor

NEW OFFICERS—Please transmit to this office at once any changes in personnel of Workmen's Compensation boards or committees or of county society officers in charge of Workmen's Compensation

DAVID J KALISKI, M D, *Director,*
FREDERIC E. ELLIOTT, M D,
JOSEPH C O'GORMAN, M D

COMMITTEE ON LEGISLATION

Bulletin No 8

February 21, 1938

New Bills Introduced

Senate Int 953—Quinn, changing term "habit-forming" to narcotic drugs as defined in section 421 of the Public Health Law, same as Assembly Int 1016—Burgdorf With the Codes Committee

Senate Int 1111—Wicks, Assembly Int. 1463—Conway, requires, along with other qualifications, person desiring to obtain license to practice medicine shall be a citizen of the United States or so declare his intention, and requires such qualification before endorsement so to practice by applicant of another country Referred to the Education Committees

Comment Physician constituents of Senator Wicks and Assemblyman Conway suggested that this bill be reintroduced They carried it a few years ago, some of you will recall There should be no objection to the enactment of this measure because it is within the possibilities of any professional person to declare his intention of becoming a citizen of the United States if he expects to make this his home and field of practice

Senate Int. 1119—Esquirol, amends the Workmen's Compensation Law by changing provisions relating to laboratories, medical treatment, which shall include surgical, x-ray, physiotherapy, anesthesia and pathological services, to hospital charges, to violations and notices in workmen's compensation cases Referred to the Labor Committee.

Comment This bill Senator Esquirol carried for us last year but it was defeated in committee It is one of the Society's bills and it is important that you let your senators know about it immediately

Assembly Int 1259—Armstrong nurses' lien, same as Senate Int 876—Miller With the Judiciary Committee.

Assembly Int. 1294—Sherman, practice of radiology, same as Assembly Int. 157—Hawkins and Senate Int. 701—Esquirol With the Education Committee

Assembly Int. 1312—Jarema, authorizes municipalities to appoint qualified physicians from list of volunteers registered with the Health Department, at annual compensation not to exceed $750 00, for medical care of indigent persons Referred to the Cities Committee.

Comment Most municipalities have this authority now and our influence has been to discourage the appointment of physicians on salary and to promote instead the care of indigents by the case method We have abundant proof that this is the better of the two methods

Assembly Int 1340—Cheney, provides for joint appointment of one health officer by two or more local boards of health, in villages and towns Referred to the Health Committee.

Assembly Int 1379—Burgdorf, permits discontinuance of county tuberculosis hospital in a county designated to be served by a State hospital Referred to the Internal Affairs Committee

Comment As we forecast when the law authorizing the creation of State tuberculosis hospitals was pending, this bill would relieve counties from the responsibility of conducting local tuberculosis hospitals Arguments may be presented for and against this plan The State hospitals can and will be more elaborate and provide greater facilities than county hospitals, on the other hand, the patient will be farther removed from his family and the expense of his treatment and care will be a less immediate charge on his community

Assembly Int. 1501—Washburn, providing for bi-weekly reports in workmen's compensation cases, same as Senate Int. 856—Howard With the Labor Committee

Assembly Int. 1535—Holley, requires wardens, guards, and keepers of correctional institutions to keep certain records of

WORKMEN'S COMPENSATION

From the Bureau of Workmen's Compensation of the Medical Society of the State of New York under date of January 13, 1938 went the following communication to the Workmen's Compensation Boards of the County Medical Societies

RULE 21 The Industrial Commissioner has changed this rule to read as follows

"Section 13-F-2 applies only to the physician selected by the claimant to treat him as provided by Section 13-A Such physicians are entitled to a fee for attendance at a hearing when subpoenaed by any party in interest or when directed to do so by a Referee or when produced by an insurance carrier or employer *When such physician is a general practitioner his fee shall be $10 plus mileage (outside New York City) and a fee of $5 for each additional case on which he testifies at the same appearance When such physician is a specialist and is so designated and qualified and has examined, consulted or treated under his specialty, his fee shall be $25 plus mileage (outside New York City) and a fee of $12.50 for each additional case on which he testifies at the same appearance In exceptional cases involving specialist's testimony, the matter may be referred to the Industrial Commissioner, who may consider the allowance of a higher fee On and after February 1, 1938, in the event of failure of such doctor to complete and submit a verified C-4 report as required by Subdivision 4 of Section 13-A, or when the content of such report is vague, misleading or otherwise incomplete, such doctor shall not be entitled to an attendance fee, unless otherwise directed by the Industrial Commissioner"*

21-A —*"A physician who testifies at hearings or examines claimants, or participates in examinations for evidential material for compensation case hearing purposes only,* may accept fees for such services from claimants"

New matter appears in italics

REPORTS —Physicians treating Workmen's Compensation cases are again urged to send in their reports *promptly* in the interest of the injured claimant, as well as their own. *C-104* reports should be mailed *within 48 hours* and *C-4* reports as promptly as possible thereafter, and, in any event, *within 20 days* of the first report

The C-4 report *must* be notarized because it can then be used as *prima facie* evidence in the consideration of the claimant's case before the referee If the C-4 report is not properly filled out and not notarized, the physician may be faced with the necessity of appearing personally on subpoena before the Department of Labor to testify, and under the new rule he will not be paid for his testimony Furthermore, a physician's bill may be objected to on the ground that he has not promptly submitted the reports to the Department of Labor and the employer or carrier

Physicians are also requested to send in a supplementary C-4 report, indicating the progress of the case, every three or four weeks Every item in this report should be filled out accurately with as much detail as possible and necessary Physicians should realize that every compensation case has a legal aspect, making prompt and accurate reports necessary in order to protect the interests of the claimant as well as those of the physician and the employer

County societies are requested to give wide publicity to the change in Rule 21 and to urge physicians to send the necessary reports promptly and in full detail

Physicians should also be urged in prolonged cases to send in progress (C-4) reports on continuing cases every three or four weeks

UNNECESSARY TREATMENT —When an insurance carrier informs a physician that in the opinion of their medical inspector further treatment is unnecessary, the attending physician should use his judgment as to compliance with the request of the insurance company to stop treatment. Treatment should be continued when, in the opinion of the attending physician, it is necessary and justified, and an immediate report to this effect sent to the employer and insurance carrier and the Department of Labor This is not a license to treat cases interminably, but the welfare of the injured employe should be kept in mind in making a decision as to the necessity for further treatment. Consultation should be urged where differences of opinion arise

MEDICAL BUREAUS —Please review your files and ascertain if you have any applications for employers' or physicians' medical bureau licenses which have not been acted upon.

In the case of applications for Employers' Medical Bureaus, please inspect the premises of the applicant at once, unless same has already been done. The county society, through the proper channels, should then make a decision approving or rejecting the application and notify the undersigned at once All application blanks, when acted upon, should be sent to this office, together with the signatures of the committee responsible for action In case of *disapproval* the reasons for disapproval should be stated on the blank.

We are enclosing rules and regulations governing medical bureaus for your guidance.

CORRECT ADDRESSES —Workmen's Compensation boards are requested, when communicating the names of physicians applying for authorization, to treat Workmen's Compensation cases to this office and to the Compensation Medical Registrar, to give the full and correct address of the physician

INJECTION TREATMENT OF HERNIA —This committee will shortly promulgate certain rules and regulations governing the injection treatment of hernia In view of the experimental nature of this treatment, all physicians should be notified that no case of hernia should be treated by this new method unless the diagnosis and compensability of the case are first confirmed by the medical examiner of the employer

or insurance carrier, and authorization obtained for such treatment, together with agreement on the fee to be charged. Except under very unusual circumstances, only a surgeon thoroughly qualified in the diagnosis and treatment of hernia and experienced in the injection treatment is qualified to render such treatment.

IMPARTIAL EXPERTS—If the county society has not already sent to this office a list of thoroughly experienced physicians qualified to act as impartial experts under Section 13 (d), they will please do so at once.

Any additions to or changes in lists already submitted should be sent to the undersigned for transmission to the Division of Workmen's Compensation of the Department of Labor

NEW OFFICERS—Please transmit to this office at once any changes in personnel of Workmen's Compensation boards or committees or of county society officers in charge of Workmen's Compensation

DAVID J KALISKI, M D, *Director,*
FREDERIC E. ELLIOTT, M D.,
JOSEPH C O'GORMAN, M D

COMMITTEE ON LEGISLATION

Bulletin No 8

February 21, 1938

New Bills Introduced

Senate Int. 953—Quinn, changing term "habit-forming" to narcotic drugs as defined in section 421 of the Public Health Law, same as Assembly Int. 1016—Burgdorf With the Codes Committee

Senate Int 1111—Wicks, Assembly Int. 1463—Conway, requires, along with other qualifications, person desiring to obtain license to practice medicine shall be a citizen of the United States or so declare his intention, and requires such qualification before endorsement so to practice by applicant of another country Referred to the Education Committees

Comment Physician constituents of Senator Wicks and Assemblyman Conway suggested that this bill be reintroduced They carried it a few years ago, some of you will recall There should be no objection to the enactment of this measure because it is within the possibilities of any professional person to declare his intention of becoming a citizen of the United States if he expects to make this his home and field of practice

Senate Int. 1119—Esquirol, amends the Workmen's Compensation Law by changing provisions relating to laboratories, medical treatment, which shall include surgical, x-ray, physiotherapy, anesthesia and pathological services, to hospital charges, to violations and notices in workmen's compensation cases Referred to the Labor Committee.

Comment This bill Senator Esquirol carried for us last year but it was defeated in committee It is one of the Society's bills and it is important that you let your senators know about it immediately

Assembly Int. 1259—Armstrong nurses' lien, same as Senate Int 876—Miller With the Judiciary Committee.

Assembly Int. 1294—Sherman, practice of radiology, same as Assembly Int. 157—Hawkins and Senate Int. 701—Esquirol With the Education Committee

Assembly Int. 1312—Jarema, authorizes municipalities to appoint qualified physicians from list of volunteers registered with the Health Department, at annual compensation not to exceed $750 00, for medical care of indigent persons Referred to the Cities Committee

Comment Most municipalities have this authority now and our influence has been to discourage the appointment of physicians on salary and to promote instead the care of indigents by the case method We have abundant proof that this is the better of the two methods

Assembly Int. 1340—Cheney, provides for joint appointment of one health officer by two or more local boards of health, in villages and towns Referred to the Health Committee.

Assembly Int. 1379—Burgdorf, permits discontinuance of county tuberculosis hospital in a county designated to be served by a State hospital Referred to the Internal Affairs Committee

Comment As we forecast when the law authorizing the creation of State tuberculosis hospitals was pending, this bill would relieve counties from the responsibility of conducting local tuberculosis hospitals Arguments may be presented for and against this plan The State hospitals can and will be more elaborate and provide greater facilities than county hospitals, on the other hand, the patient will be farther removed from his family and the expense of his treatment and care will be a less immediate charge on his community

Assembly Int. 1501—Washburn, providing for bi-weekly reports in workmen's compensation cases, same as Senate Int. 856—Howard. With the Labor Committee

Assembly Int. 1535—Holley, requires wardens, guards, and keepers of correctional institutions to keep certain records of

persons admitted and to provide for physical examination upon admittance Referred to the Penal Institutions Committee

Comment We are particularly interested in the portion of this bill which requires that physical examination shall be made of all persons committed to correctional institutions There is no doubt but that there is value in this legislation and it should receive hearty support.

Assembly Int. 1549—Brenner, amends generally the Workmen's Compensation Law relative to insurance carriers, provides State Fund shall be administered by seven commissioners who shall have sole right to make rates for workmen's compensation insurance in Fund, rates not to be higher than necessary to provide adequate funds, and makes other changes Referred to the Insurance Committee

Comment Increases the scope and influence of the State Insurance Fund This may be another attempt to give the State Insurance Fund a monopoly in the workmen's compensation field

Assembly Int 1551—Doran, relates to care and treatment of injured employees, authorizes the Industrial Commissioner to appoint a board of medical consultants, provides licensing of compensation medical bureaus and laboratories shall be on recommendation of Industrial Council instead of County Medical Societies, and changes composition of Arbitration Committee for determining value of medical aid Referred to the Labor Committee

Comment Relieves the County Societies of approval and supervision of medical bureaus and laboratories and places that responsibility with the Industrial Council It also gives the Industrial Board the right and power to have any claimant for compensation whose case is being heard examined by a physician of their own designation, and to require a "report from such physician on the diagnosis, the casual relationship between the alleged injury and the subsequent disability, proper treatment and the extent of the disability of such claimant." It requires that all surgical or physiotherapeutic procedures must be authorized by the employer instead of only those costing more than $25 00, as the law now requires It makes more liberal the law under which insurance carriers and employers may create and conduct clinics It revises the manner in which arbitration boards shall be created and constituted, by removing "two physicians designated by the president of the Medical Society of the county in which the claimant resides and two physicians also members of the Medical Society of the State of New York, appointed by the employer or carrier," and substitutes in its place, "one representative of labor, one representative of carriers or employers, and one representative of physicians, who shall be appointed by the Commissioner to serve for terms of one year each"

* * *

Our legal advisor has called our attention to a bill which we overlooked—Senate Int. 310—McElroy, Assembly Int. 193—Monaco Referred to the Codes Committee in the Senate and the Labor Committee in the Assembly This bill would repeal section 1910 of the Penal Law which reads "Endangering life by refusal to labor A person, who wilfully and maliciously, either alone or in combination with others, breaks a contract of service or hiring, knowing, or having reasonable cause to believe, that the probable consequence of his so doing will be to endanger human life, or to cause grievous bodily injury, or to expose valuable property to destruction or serious injury, is guilty of a misdemeanor"

Comment If this were repealed, it would be possible for any hospital employees to go on strike and, therefore, we feel that it is a very bad bill

In our last bulletin we reported Assembly bill Int 1224—Averill, in relation to nurses and trained attendants To this bill we make the following comment

This bill was prepared and submitted at the request of the Department of Education Besides making a few obvious corrections, it provides conditions under which nurses educated outside the State may be licensed, it permits the Department to issue a registry of the nurses practicing in the State at its discretion, rather than annually as previously provided, and outlines extensively under what conditions and by what procedure licenses to practice nursing may be revoked or suspended

Action On Bills

Senate Int. 99—Twomey—Health Law, syphilis tests—Reported

Senate Int 790—Livingston—Charities Law, definition of dispensaries—3rd rdg

Assembly Int 127—Newell—Health Law, syphilis tests—3rd rdg

Assembly Int. 351—Crews—Hours of labor, hospital employees—has been amended so as to apply to hospitals in cities having a population of one million or more

The Legislative Committee, in conference on February 19, took the following action upon these bills

Approved

S Int. 790—Livingston—Charities Law, definition of dispensaries

S Int 876—Miller—Nurses' lien bill

S Int. 899—Rogers—Sterilization of drinking glasses

A Int 1015—Burgdorf—Definition of "cannabis"

A. Int 1016—Burgdorf—Violations of Public Health Law relating to narcotic drugs

A Int. 1219—Piper—First-aid kits for omnibuses

A. Int. 1224—Averill—Relating to nurses and trained attendants

S Int 202, *late Print 870*—Stagg—Relating to poliomyelitis

A Int. 287, *late Print 1175*—Shaw—Relating to poliomyelitis

This bill has been amended to apply only to victims of anterior poliomyelitis over twenty-one years of age The present law applies only to persons under twenty-one

Approved with Comment

S Int. 753—Feld—Practice of hairdressing and cosmetology

The Committee realizes the need for regulation among those who engage in this business, but is of the opinion that future legislation will be needed to protect customers against unwise employment of procedures which may be a definite influence on the health of the customer

Opposed

S Int 856—Howard—Treatment and care of injured employees

S Int. 889—Williamson—Hospitals to be reimbursed by State for medical care of indigents

S Int 895—Feld—Endorsement of foreign licenses

S Int. 310—McElroy—Hospital strikes

A Int 193—Monaco

Hearings

March 1

S Int 101—Desmond and A Int 124—Breitbart—Pre-nuptial examinations Joint hearing before Health Committee

Bulletin No 9

February 28, 1938

New Bills Introduced

Senate Int 1179—Esquirol, provides for regulation and licensing of hairdressing, beauty culture, and beauty parlors, creates a regulatory board, provides for sanitary inspection, and appropriates $15,000 Referred to the Health Committee

Senate Int 1222—Desmond, tests for determining intoxicated drivers, same as Assembly Int 334—Peterson With the Motor Transportation Committee

Senate Int 1224—Desmond, provides that proof of fitness for motor vehicle operator's and chauffeur's license shall include certificate of physician that applicant has been examined and has no physical defect which would render him unfit to drive a motor vehicle Referred to the Motor Transportation Committee

Senate Int 1264—Burchill, appropriates $75,000 to the tax department for carrying out provisions of proposed law to tax tobacco and tobacco products Referred to the Finance Committee

Comment In the body of the bill there is provision that this money shall be used for the establishment and conduct of dental clinics in public schools There was a similar bill before the Legislature last year which was defeated in committee The dentists, we are informed, are opposed to this bill

Senate Int. 1311—Desmond, Assembly Int 1666—Mailler, provides for hospitalization of persons injured in motor vehicle accidents who are unable to pay for such care Referred to the Motor Transportation Committee in the Senate and the Ways and Means Committee in the Assembly

Comment As indicated, this bill refers only to victims of motor vehicle accidents, and for that purpose it defines a "motor vehicle injury" to mean any injury caused by operation of a motor vehicle whether the person be the operator, passenger, or a pedestrian, and its application is limited to those injured persons who are unable to pay the expenses of hospitalization, defined as "indigent patient" It provides that when an account remains unpaid for ninety days, the hospital shall file with the comptroller and the nearest city or county commissioner of public welfare, a statement, and the comptroller shall reimburse the hospital in accordance with the per diem cost of such hospital The Commissioner of Health shall certify to the comptroller the per diem cost of all hospitals in the State as determined by him For financing the law it is provided that the Commissioner of Motor Vehicles "shall deduct the sum of two cents from the amount of the fee of every registration of a motor vehicle"

Senate Int 1373—Livingston, provides for licensing clinical laboratory technicians Referred to the Education Committee

Comment Although this bill is not

identical with the bills that have been introduced in previous years, nevertheless, the objections made to those are applicable No adequate definition of a technician can be offered, and to provide that all shall be licensed would be introducing an obstacle to scientific work as well as to the private work of a physician or other scientist. A clinical laboratory technician is defined as "any person who performs any technical laboratory procedures, including bacteriology, immunology, serology, biochemistry, hematology, histologic technique and clinical pathology which are used for the purpose of diagnosing, investigation or treating any disease, illness or infection" It would prevent the employment by a doctor of any person to be a laboratory technician except from the licensed group, and it would require that every person so licensed shall have had a four-year high school course, a college diploma, showing graduation in the subjects quoted above, or has practiced as a clinical laboratory technician for a period of at least six months prior to July 1, 1941, and for any person to practice or represent himself to be a clinical laboratory technician without having a license shall be guilty of a misdemeanor

Senator Livingston introduced the bill at the request of a group of laboratory technicians

Senate Int. 1374—Livingston, provides for licensing physical therapy technicians and sets up qualifications, no physiotherapist or technician to administer physical therapy except on written prescription of duly licensed physician, and makes other provisions Referred to the Education Committee

Comment The bill does not differ materially from bills that have been introduced in previous years, nor in our opinion does it differ enough from the present law to justify itself This bill was also introduced by Senator Livingston at the express request of a group of physiotherapy technicians

Assembly Int. 1641—Steingut, broadens and clarifies provision for nullifying registration of a physician offering, undertaking or agreeing to cure or treat a disease by secret method or who advertises by means of handbills, motion pictures, radio, magazines or newspapers, etc, or has in any way been guilty of unprofessional conduct Referred to the Education Committee.

Comment This bill was introduced at the request of the Department of Education and should receive our wholehearted support. It has been requested by the Grievance Committee and the special Deputy Attorneys General who assist in the enforcement of the Medical Practice Act.

Assembly Int 1743—Piper, makes it unlawful to dispense, furnish or supply, as well as sell, in any store, any spectacle, eyeglasses or lenses for aid, as well as correction of vision, except on written prescription from a licensed physician or duly qualified optometrist, also makes it unlawful to advertise by radio or other means prices for, discount on, or terms of payment for eyeglasses, etc. Referred to the Education Committee

Comment The optometrists are attempting a clearer definition of their practices so as to prevent inroads by commercial agencies not employing either a physician or an optometrist. Among the offenders they list many department stores, jewelry stores, and certain chain stores The bill also adds the prohibition to advertising similar to what we are endeavoring to have incorporated in our law

Assembly Int. 1744—Piper, defines "optometry" to include persons examining eyes or diagnosing any ocular condition for providing, furnishing or adapting light, devices or any other means for restoring or relief of any optical or ocular condition, deficiency or deformity, visual or muscular anomaly of the human eye Referred to the Education Committee

Action on Bills

S Int. 99—Twomey, Serological blood tests—3rd reading

S Int. 117—Feld, Practice of radiology—has been amended by deleting "and the General Municipal Law, in relation to power of municipal corporations to grant permits to physicians, dentists, podiatrists, and osteopaths to conduct places for the practice of radiology," and by adding after laboratory, "or a mobile unit." This addition, Senator Feld says, is to permit the school authorities to continue examining school children for incipient tuberculosis

S Int. 644—McNaboe, Persons committer to care of lunacy board—Reported

S Int 651—McNaboe, Creating lunacy authority—2nd reading

S Int 753—Feld, Cosmetology—Reported

S Int 790—Livingston, Definition of dispensary—3rd reading

S Int. 869—Kleinfeld, Physicians' lien—has been amended to include provision for filing a statement of services rendered and charges, also provision for discharge of lien

S Int. 880—Quinn, Examination of hospital records—Reported

S Int. 953—Quinn, Changing term "habit-forming" to narcotic drugs—Reported.

A Int. 127—Newell, Serological blood tests—3rd reading

A. Int. 1016—Burgdorf, Changing term "habit-forming" to narcotic drugs—3rd reading

TO OUTLAW QUACK MEDICINE IN THIS STATE

Creation of a consumers' bureau in the State Department of Health to protect the unwary from quack medical preparations was proposed by Assemblyman Ira H Holley (D, Manhattan), in a twenty-eight-page bill to amend the public health law on Jan 20 as reported in the New York *World-Telegram*

This measure, Mr Holley explained, would be "a little Tugwell law," similar in plan and scope to the federal legislation, but confining itself to patent medicines, drugs, cosmetics and medical devices Consumers of some of these preparations, he said, are defrauded annually of millions of dollars

Mr Holley asserted that the failure of Congress to enact a new pure food and drug act "makes it imperative for each State to protect its citizen consumers from the deluge of quack medical preparations"

Many of these preparations are inherently dangerous, the Assemblyman continued, and have caused hundreds of deaths Thousands of persons, he said, through using these panaceas, have delayed seeking proper medical attention, with fatalities resulting in many instances

The Holley measure is approved by the Public Health Committee of the New York Academy of Medicine, its sponsor said

This consumers' bureau, in addition to other duties, would have power to prohibit fictitious, false remedial claims and to bar from sale in this State any product inherently dangerous to health and life

Heading the bureau would be a director appointed by the Health Commissioner, with the approval of a majority of a committee on public health This committee, consisting of five members, would be appointed by the Governor from a list nominated by the State Board of Regents They would be persons distinguished for scientific attainments and interest in public health

HANDBOOK ON EYE HAZARDS AT A NEW LOW PRICE

To secure wider distribution of its book on "Eye Hazards in Industrial Occupations" by Louis Resnick and Lewis H Carris, the National Society for the Prevention of Blindness is now offering copies at the special price of fifty cents each as long as the supply lasts This book, which sold formerly at the actual cost price of $1 50, was published in 1924 Although some of the photographs show safety devices which have since been improved upon, the contents remain a valuable guide to safe practices in industry

"Eye Hazards in Industrial Occupations" is a handbook for safety engineers, safety inspectors, safety committeemen, industrial physicians and nurses, for those responsible for industrial operations, whether owners, managers, or members of the operating staff, for governmental officials, trade association executives, and social agency officers, and for the many others who share the responsibilities and opportunities for conserving the life, health and sight of the millions of men, women, and children employed in industry

The volume contains 247 pages, and includes fifty-nine illustrations dealing with the safeguarding of eyesight in factories, mines, shops and offices Orders or inquiries concerning this volume should be addressed to the National Society for the Prevention of Blindness, 50 W 50 Street, New York City

Narcotic Leakages

J Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

As the production of narcotics in the world markets is limited towards a maximum estimated requirement for medicinal purposes and as the smuggling of illicit narcotics is further controlled by federal agencies, the demand turns more insistently towards legitimate stores of narcotics for which the medical profession has accepted responsibility A kind of vacuum is created around the drug cupboards in institutions and in doctors' offices by the craving of unsatisfied addicts How much leakage occurs? No quantitative answer can be given to this question from existing records But there are indications that the leakage in recent years has been important

The other day at the State Bureau of Narcotics Control, I saw a list comprising some 300 individuals from New York City, all closely related to the profession of medicine, who had been arrested for violation of narcotic laws since the year 1928 Most numerous in the list were nurses and hospital orderlies There were also pharmacists, chemists, and hospital attendants, and of course a few physicians

Nor are the thieves limited to those whose occupation brings them within range of the legitimate stores One man whose source of illicit supply had been removed got a job as a painter in a physician's office and helped himself to syringes as well as to the drugs he needed

To measure—and eventually to control—the leakage of narcotics from institutional supplies we have a law (Section 421, paragraph 8, Section 424 and 424a of Article 22) by which the Bureau of Narcotics Control in the State Department of Health is charged with issuing certification of approval to our institutions The bureau must be satisfied (1) that drugs are safely stored and (2) that an accurate record of their distribution is made and preserved, before a certificate can be issued The kind of storage afforded to their diamond mine by the seven dwarfs is not considered good enough Though custodians do not often hang their keys in quite such prominent proximity to the locks as did Dopey, keys are often easily available to several other persons besides the custodian Experience teaches that such storage is not "safe."

Certificates in accord with the law have now been issued to 225 institutions which is about one-third of the total number that must be inspected

Mr Frank J Smith who has charge of our Bureau of Narcotics has been a good deal disturbed by the occupational histories of some hospital employees who have been caught in violations of the narcotic laws "Now here's a chap," he said, taking down a folder from his files, "who has been an institutional employee from 1931 until last year when he was arrested. He has been employed in six hospitals in the last six years When caught with morphine in his possession he admitted having stolen it as well as several small pieces of equipment from one of these hospitals Since he shows no sign of addiction he is presumably supplying addicts He has letters of recommendation from personnel (other than the executive officers) of all six institutions" Mr Smith feels that there is sometimes a tendency to discharge suspicious individuals without making any formal charge He would be glad to keep an office file of characters whose activities will bear watching Or, better still, he would welcome an invitation to investigate the behavior of any suspect with the purpose of either clearing his character from suspicion or lodging a formal charge It is necessary, he feels, to devise some means of removing the inside jobbers from circulation among institutional employees

The main responsibility of his bureau, as Mr Smith sees it, is preventive and educational He acknowledges with gratitude splendid cooperation on the part of medical colleges, colleges of pharmacy, and the leaders of the nursing profession To such groups he has thankfully accepted invitations to speak on the narcotic problem He has also been asked to address high schools but these invitations he has declined because he believes that only trained educators should be trusted with adolescent education and that even for them the task of narcotic education is peculiarly delicate He is willing, however, to meet with the educators and tell them all that he knows that they may have the facts to present with their own skilled approach

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

KINGS COUNTY A great number of the members of the Kings County Woman's Auxiliary attended the testimonial dinner and dance given Dr Chas A Goodrich on February 22 at the Hotel Astor in New York City

Among the guests from other Counties were Mrs Francis R. Irving of Syracuse, State President of the Woman's Auxiliary, Mrs Carlton M Potter, State Treasurer, Mrs Louis A VanKleeck, State Finance Chairman, Mrs Henry L Hirsch, State Secretary, Mrs Carl Boettiger, State "Hygeia" Chairman, Mrs Luther H Kice, State Legislation Chairman, and Mrs John J Buettner, State Organization Chairman

Several of the speakers commended the members of the Woman's Auxiliary for their support of the dinner as well as their cooperation with the Medical Society in legislative matters

The opinion seemed unanimous that the dinner was splendid, the Speakers interesting, the entertainment good, and that the excellent dance music ended all too soon In short, "A good time was had by all"

SARATOGA COUNTY Mrs G Scott Towne, President, presided at a meeting of the Woman's Auxiliary of Saratoga County on February 1 at the home of Mrs A. J Leonard Dr Walter S McClellan addressed the group on venereal diseases The Chairman on Legislation, Mrs Thomas E Bullard urged all doctor's wives to become law-minded Mrs Joseph Lebowich, Chairman of Health and Education, reported that a program is in the making aiming to aid in the control of syphilis She will represent the Auxiliary at a meeting with members of various county organizations to make definite plans for a county-wide program

SUFFOLK COUNTY The Executive Committee of the Woman's Auxiliary to the Suffolk County Medical Society met at a luncheon meeting at the "Bonnie-Mart," Patchogue, on February 15

The President, Mrs Stanley P Jones, presided at the business meeting Mrs Grover A. Sillman, Legislation Chairman, gave a report on several important bills in Albany, which are now under consideration, relative to the Medical Profession Mrs Jones announced that two films on syphilis and tuberculosis are now available for public showing Dr Elizabeth C Wells of the Public Health Department at Riverhead will give all information concerning the use of the films and every civic group is urged to plan a showing of these important pictures

Mrs S K Oxholm gave a very interesting discussion of the thirteenth Woman's Patriotic Conference on National Defense which was held in Washington on January 25 to 27

* * *

Do you recall in your childhood the special occasions when you were allowed to sit at the table when only adults were present? How excited, interested and attentive you were to all that was said and done

With similar emotions this Chairman sat and listened at the conference of the County Legislative Chairmen of the Medical Society held in Albany on February 9

It was the first conference that a chairman of the Woman's Auxiliary to the Medical Society of the State of New York had been invited to attend This was indeed both an honor and a privilege For the Woman's Auxiliary, while on the threshold of its third year, is still an infant.

The many bills studied at this conference and reasons for any action taken thereon, could not but result in a better understanding of the scope of work undertaken by the Legislative Committee of the Medical Society

Therefore, with a more thorough and comprehensive knowledge of pending legislation, we shall continue the legislative program of the Auxiliary with added interest as well as enthusiasm With the activities of this program, however, the meaning of the word "Auxiliary" must be always kept in mind

Narcotic Leakages

J. Rosslyn Earp, L.R.C.P., Dr.P.H.
New York State Department of Health

As the production of narcotics in the world markets is limited towards a maximum estimated requirement for medicinal purposes and as the smuggling of illicit narcotics is further controlled by federal agencies, the demand turns more insistently towards legitimate stores of narcotics for which the medical profession has accepted responsibility. A kind of vacuum is created around the drug cupboards in institutions and in doctors' offices by the craving of unsatisfied addicts. How much leakage occurs? No quantitative answer can be given to this question from existing records. But there are indications that the leakage in recent years has been important.

The other day at the State Bureau of Narcotics Control, I saw a list comprising some 300 individuals from New York City, all closely related to the profession of medicine, who had been arrested for violation of narcotic laws since the year 1928. Most numerous in the list were nurses and hospital orderlies. There were also pharmacists, chemists, and hospital attendants, and of course a few physicians.

Nor are the thieves limited to those whose occupation brings them within range of the legitimate stores. One man whose source of illicit supply had been removed got a job as a painter in a physician's office and helped himself to syringes as well as to the drugs he needed.

To measure—and eventually to control—the leakage of narcotics from institutional supplies we have a law (Section 421, paragraph 8, Section 424 and 424a of Article 22) by which the Bureau of Narcotics Control in the State Department of Health is charged with issuing certification of approval to our institutions. The bureau must be satisfied (1) that drugs are safely stored and (2) that an accurate record of their distribution is made and preserved, before a certificate can be issued. The kind of storage afforded to their diamond mine by the seven dwarfs is not considered good enough. Though custodians do not often hang their keys in quite such prominent proximity to the locks as did Dopey, keys are often easily available to several other persons besides the custodian. Experience teaches that such storage is not "safe."

Certificates in accord with the law have now been issued to 225 institutions which is about one-third of the total number that must be inspected.

Mr. Frank J. Smith who has charge of our Bureau of Narcotics has been a good deal disturbed by the occupational histories of some hospital employees who have been caught in violations of the narcotic laws. "Now here's a chap," he said, taking down a folder from his files, "who has been an institutional employee from 1931 until last year when he was arrested. He has been employed in six hospitals in the last six years. When caught with morphine in his possession he admitted having stolen it as well as several small pieces of equipment from one of these hospitals. Since he shows no sign of addiction he is presumably supplying addicts. He has letters of recommendation from personnel (other than the executive officers) of all six institutions." Mr. Smith feels that there is sometimes a tendency to discharge suspicious individuals without making any formal charge. He would be glad to keep an office file of characters whose activities will bear watching. Or, better still, he would welcome an invitation to investigate the behavior of any suspect with the purpose of either clearing his character from suspicion or lodging a formal charge. It is necessary, he feels, to devise some means of removing the inside jobbers from circulation among institutional employees.

The main responsibility of his bureau, as Mr. Smith sees it, is preventive and educational. He acknowledges with gratitude splendid cooperation on the part of medical colleges, colleges of pharmacy, and the leaders of the nursing profession. To such groups he has thankfully accepted invitations to speak on the narcotic problem. He has also been asked to address high schools but these invitations he has declined because he believes that only trained educators should be trusted with adolescent education and that even for them the task of narcotic education is peculiarly delicate. He is willing, however, to meet with the educators and tell them all that he knows that they may have the facts to present with their own skilled approach.

Medical News

Cayuga County

DR. FREDERICK SEFTON, of Auburn, who died on February 3 at the age of seventy-eight, had practiced medicine there since 1891, specializing in nervous and mental troubles From 1886 to 1891 he was senior medical officer and superintendent of the New York State Asylum for Insane Criminals He was president of the Auburn Savings Bank and active in many other Auburn institutions and organizations

Dutchess County

THE DUTCHESS COUNTY MEDICAL society will begin its sixteenth educational campaign against cancer March 16, with a dinner meeting, Dr Helen L Pallister, chairman of the cancer committee, made known at the meeting of the society on Feb 9 Dr Louis Kress, assistant director of the New York State Institute for Malignant Disease, will be the speaker The campaign will continue through April and May

Dr James J Short, of the Post Graduate hospital, New York city, was the speaker at the February meeting His topic was "Studies in Obesity"

AT THE REQUEST OF THE Dutchess County Medical Society, the Board of Supervisors went on record on February 14 endorsing the drive for the eradication of syphilis and other social diseases, and promising continued county support.

A letter from Dr Howard P Carpenter, secretary of the Society, set forth the general work which has been done, and urged that the drive be continued.

The public health committee recommended that (1) Treatment of indigent persons infected be continued, (2) Treatment be confined to the class of cases as limited by the Society, and that (3) The offer of the Society to aid in checking bills of doctors be accepted and that a system of tickets be established.

The matter was referred to the public health committee to put the recommendations into operation

Erie County

DR CORNELIUS J CARR, seventy, and Dr Hiram A Kendall, seventy-two, both of Buffalo, who died on February 12 and February 14 had each practiced medicine more than forty years

Kings County

THE SOUTH BROOKLYN MEDICAL Society, on February 10, at the newly opened Red Hook-Gowanus Health and Teaching Center, adopted a resolution criticizing extension by the city of free medical service, especially in the treatment of social diseases

The motion called for the appointment of a committee to petition Mayor LaGuardia, and Health and Hospital Department authorities, to have physicians perform such medical services in the privacy of their own offices for a fee equal to what it costs the city for such treatments

Some seventy-five attended the meeting and branded the free service as constituting socialized medicine "without benefit of payment to the medical profession, which has always given to the needy of its skill and charity"

Dr Pasquale J Imperato of the society's council explained that fulfillment of the group's proposal would have the two fold effect of returning the practice of medicine to the profession "until socialized medicine becomes an eventuality, if ever," and also removing the stigma of charity and shame many persons feel in attending free institutions

Most doctors, he claimed, would be glad to co-operate in the present drive to reduce social disease by treating cases in the privacy of their own offices for a fee matching or even lower than the expense now borne by the taxpayers

Dr Rodolph Cutino, president, presided at the meeting, at which Dr Emily Dunning Barringer, attending physician at Kingston Avenue Hospital, Dr Augustus L Harris of Cumberland Hospital and Dr John Sturdivant Read, former president of the Kings County Medical Society, also spoke on aspects of social diseases

ON FEBRUARY 17, the Society took a stand against the Health Department's announced plan to abandon the complement fixation test to detect social disease taints in patients committed to city institutions

Until a better method is devised, this blood test should be continued, physicians who are members of the society agreed It also advocated adoption of the same scientific methods that now govern use of this test in research laboratories of the city and at Kingston Avenue Hospital

DR WALTER S TERHUNE, eighty-four, practicing physician in Brooklyn for more than sixty years, died on February 10 at

his home In 1927 Dr Terhune was one of seven in a class of fifty-two to receive a golden anniversary diploma from the New York Homeopathic Medical College and Flower Hospital, where he had received training, in recognition of fifty years of practice.

DR A BOYCE MARION, who was for nearly fifty years a general practitioner in Brooklyn, died on February 16 in the Swedish Hospital of pneumonia after an illness of a week

DR. M E BINET, PRESIDENT of the Vichy Medical Society of Vichy, France, and authority on gastro-intestinal ailments, was the guest speaker at a meeting of the Williamsburg Medical Society in the Leon Louria Memorial Auditorium of the Jewish Hospital, St Mark's and Classon avenues, on Feb 14

Dr Binet read a paper on chronic colitis He was introduced by Dr Anthony Bassler of the New York Chapter of the National Society for the Advancement of Gastroenterology, which jointly sponsored the meeting with the medical society

Following Dr Binet's talk, a discussion was conducted by Dr Albert F R. Andresen, Dr Walter S McClellan and Dr Roy Upham

Montgomery County

THE MEDICAL SOCIETY OF THE COUNTY of Montgomery met on February 16 at Amsterdam in St Mary's Hospital, Dr Edward A Bogdan presiding The speaker was Dr F A E Alexander He had for his subject, "Use of Common Depressant Hypnotic for Pre- and Post-Anaesthesia" Dr R C Simpson, Dr C A Spence, Dr H M Hicks, Dr W H Seward, Dr Roger Conant and Dr J A Shannon took part in the discussion

New York County

DR. MARION B SULZBERGER, assistant professor of clinical dermatology and syphilology at the New York Postgraduate Medical School, Columbia University, will speak at the New York Academy of Medicine on March 26 at 4 30 on "The Recognition and Management of Common Skin Diseases in General Practice"

THE BUREAU OF SOCIAL HYGIENE of the Health Department of the City of New York, announces a short, practical course in the diagnosis and treatment of Syphilis and Gonorrhea and other genitoinfectious diseases to be conducted by its own personnel in its own clinics Application blanks may be secured from the Director, Bureau of Social Hygiene, 125 Worth Street, New York City

A SCIENTIFIC SESSION OF THE New York Heart Association will be held on March 29, at 8 30 P M, in the New York Academy of Medicine This is a joint meeting with the Committee on Cardiac Clinics of the New York Heart Association, Dr Alfred E Cohn, Presiding Officer There will be two papers presented "Studies of the Circulation in Chronic Constrictive Pericarditis Before and After the Resection of the Pericardium" by Harold J Stewart, M D, Associate Professor of Medicine at Cornell University Medical College and Attending Physician, New York Hospital, "Studies on the Pathology of Vascular Disease" by Milton C Winternitz, M D, Professor of Pathology at Yale University School of Medicine

Niagara County

THE NIAGARA COUNTY Medical Society met on February 8 at the Nurses' Home of DeGraff Memorial hospital Dr Clayton W Greene, Buffalo heart specialist, spoke on "What Can We Do for Angina Pectoris Coronary Occlusion"

Queens County

A "BEEFSTEAK AND BARN DANCE" of the Medical Society of the County of Queens was given at the Medical Society's building on February 26

DR MARSHALL PEASE will speak at the Medical Society's building on March 18 at 4 30 on "Rheumatism in Childhood"

"LEGISLATIVE PROPOSALS FOR THE Elimination of Social Diseases" was the subject of an address by Dr Walter Lynn, chairman of the legislative committee of the Queens County Medical Society, at a meeting of the Queens Youth Assembly, Queens County Medical Society, and Queensboro Tuberculosis and Health Association at Jamaica Town Hall on February 10

Dr Lynn, just returned from Albany, spoke on the bills before the State Legislature to control syphilis Dr Herbert Silvers spoke on his work on the treatment of venereal diseases Dr M L Ogan, Jamaica district health officer, presided

A motion picture, "For All Our Sakes, sponsored by the American Social Hygiene Association depicting gradual control of communicable diseases, was shown.

The meeting was one of a city-wide

series in connection with the Health Department campaign to combat social diseases

Rensselaer County

THE RENSSELAER COUNTY Medical Society, meeting at the Health Center in Troy on February 8 instructed its traffic committee to ask Dr Walter D McKenna, commissioner of public safety, to liberalize enforcement of the city's new parking regulations in so far as they affect doctors

While the traffic situation in Troy has improved, the group feels the present parking restrictions are working hardships upon practicing physicians

The doctors believe they should be permitted to park their cars close to their offices during office hours, being extended this privilege as public servants who always must be ready to handle emergency cases They further feel there should be no time limit on their parking as, they point out, their cars should always be accessible

One doctor declared that on three different occasions he had been compelled to walk three blocks to his garage to get his car in answer to emergency calls from hospitals The time element is important, especially in emergency cases, it was pointed out, and doctors should not be hampered in their work.

The society will not ask the city to extend the parking privileges to physicians and surgeons, except to those on official duty Doctors making social calls should not be given privileges above those enjoyed by the other citizens, they agreed

Under a ruling by Dr McKenna, doctors already have the privilege of parking their cars for indefinite periods when making calls on patients, it was announced

A paper on the workmen's compensation laws as they relate to physicians was read by Dr Richard P Doody Another paper on "Pagets Disease and Hyperthyriodism —A Differential Study" was read by Dr C J Handron and discussed by Dr M. E DeLuca and Dr H T Wygant.

Schoharie County

AT A SPECIAL MEETING of the Schoharie County Medical Society held in the Library of the Lark Street School, Cobleskill, February 17, the following very excellent papers were read and business conducted

1 "Dental x-ray of Interest to the Physician," D L Bassett, D D S
2 "Pneumonia" Meleatus Bruce M D
3 "Syphilis," David W Beard, M D

On motion duly made, seconded and carried, the Chairman of the Economics Committee was requested to contact our Senator and our Assemblyman and urge them not only to favor but to work for the enactment of the Doctor's Lien Law

On motion the "Report of the Sub-Committee to Study Policies Relating to Standing Orders for Public Health Nurses" was approved with the following amendment—

When a county nurse first makes a call on a prenatal case, she must instruct the patient to visit and engage a physician. If on her second call, the patient has neglected this duty and has not seen a physician, the nurse shall not make another call until assured the patient has visited a physician, and she may then make future visits only on the instruction of the physician so engaged. The nurse must not under any circumstances take blood pressure or make urinalyses unless so instructed by the physician in charge —Reported by H L ODELL, M D, *Secretary*

Ulster County

UNLESS EMPLOYERS OF Ulster county allow their employees to select their own physicians under the terms of the State Compensation law, they will be reported to the State Department of Labor, it is announced by a committee of the Ulster County Medical Society Certain employers, it is said, have refused to permit their employees to pick their doctors as provided by the law

Wayne County

DR LUTHER H OEHLBECK, x-ray specialist at Clifton Springs Sanitarium, spoke at the meeting of the Wayne County Medical Society on February 8 in Lyons, on "Roentgen Rays as a Palliative and Curative Therapeutic Agent"

Westchester County

INVESTIGATION OF THE growth, sale and use of marijuana will be undertaken by the Westchester Medical Society

Physicians are alarmed over the increasing use of this drug, and the monthly meeting of the society at New York Hospital, White Plains, on February 15 adopted a resolution for the investigation

The investigation will consider the source of the Mexican weed both locally and from outside the County as it affects Westchester residents The physicians will sift reports that high school students are smoking marijuana and that "every backyard" in some sections of Westchester cities and villages contains a patch of the narcotic weed

Hospital News

Rate Cuts Urged for Hospital Insurance

A SHARP WARNING WAS sounded, at the first national meeting of hospital insurance heads in New York City, on February 17-18, that the present rates must be cut, or the government may enter the field in competition and set up its own system of hospitalization

The possibility that some sort of government control would supersede the present voluntary hospital care insurance systems unless their rates were lowered to permit more of the public to participate, was held up to the national conference of hospital insurance executives by C Rufus Rorem, of Chicago, director of the committee on hospital service for the American Hospital Association Mr Rorem disclosed that the National Security Board, through its bureau of research and statistics, was contemplating a study of hospital care insurance, and that similar studies were being made by private insurance groups

City, State and Federal units of government, he said, were interested in the prospects that their free hospital wards could thus be relieved to some extent of patients who were able to pay a fraction of the cost of their hospitalization, and that tax loads would thus be lightened At present, he said, one-third of all the patients in hospitals were charity cases, whereas only approximately one-tenth of the population was on relief, indicating that many of the charity patients would have been able to pay at least a small fraction of the cost of their hospitalization He estimated that perhaps one per cent of the annual family income, or a minimum of $12 could be applied to hospital insurance

A "Disastrous" Possibility

"At the present time," he said, "a large number of people are being admitted to government hospitals—Federal, state or local—at the expense of the taxpayers

"If the rates of the voluntary plans were somewhat lower, say an average of 1 per cent of the family income, the taxpayer would be relieved literally of millions of dollars by having a substantial proportion of people in government hospitals cared for through voluntary plans"

Referring to the contemplated study of hospital insurance by the Social Security Board, he said

> It is up to the voluntary plans to bring their rates within the ability and willingness of the average man to pay them, if government interference is to be avoided Government co-operation might be desirable, but a plan dictated by government officials would be disastrous It is hoped that the voluntary hospital plan executives throughout the country will see to it that their experience is capitalized rather than neglected by other voluntary plans yet to be organized.
>
> I believe that public interest is subjecting the movement to a scrutiny not anticipated, some of which is sympathetic, some critical. Unless plans are made available with lower rates for the lower income groups, the government may find it necessary to establish a hospital insurance plan of its own.

The Hospital Pharmacy

IN MANY INSTANCES the hospital pharmacy is in the position of a neglected stepchild It is quite true that in the small institution the maintenance of a pharmacy is economically an unsound policy and these carry only stock solutions in a drug storage room, sending all prescriptions to a licensed pharmacist for compounding The large hospital maintains a regular pharmacy with a qualified pharmacist in charge

The hospital in between these extremes, that of average size, is the one that really offers a serious problem, notes the Editor of *Hospital Management*, since many prescriptions must be compounded and large quantities of stock are consumed, yet the volume of work is not sufficient to warrant a full-time pharmacist. In some cases the problem is solved by employing a registered pharmacist on a part-time basis, but all too often prescriptions which require compounding are sent to an outside pharmacy while stock solutions, ready made prescriptions and similar items are in charge of an intern, or some other person of responsibility

We consider this to be a serious and dan-

gerous situation, declares this editorial authority We question both the advisability and the legality of allowing any drugs to be compounded or issued except under supervision of a person who has had the requisite training

Mistakes have been made in such simple dispensing as stock solutions and ready made prescriptions Certainly such control is illegal We believe that the law is the same in all states, requiring that only a licensed pharmacist shall dispense drugs and that the original prescription be kept on file in the pharmacy

It is, therefore, our belief that compounding and issuance of all drugs should be under control of a licensed pharmacist in every hospital regardless of its size In the small or medium sized hospital this can always be arranged with a local pharmacist who will either carry the stock for the hospital or spend part of each day in the institution's pharmacy and control it It is true that this will add slightly to the cost, but the added safety is well worth the extra expenditure and the pharmacy can always be made to pay dividends

The American Hospital Association has made the first effective move toward recognition of the problem by organization of a subsection on pharmacy The American Pharmaceutical Association also has a well established subsection on hospital pharmacy The committee on pharmacy of the A H A in its second report, 1937, has called attention to "unsatisfactory conditions," and there can be no doubt that remedies will be found

Improvements

A $3,000,000 Hospital for the New T B Therapy

Plans to build a nine-story $3,000,000 tuberculosis hospital with accommodations for 530 patients in Jamaica, Queens, are announced by Dr S S Goldwater, Commissioner of Hospitals The building is to be started this year, at Parsons Boulevard and Goethals Avenue, adjoining the Queens General Hospital It will be known as the Triboro Hospital for Tuberculosis

Commenting on the fact that the hospital would be erected in the city, in a thriving community, Dr Goldwater explained that modern treatment of tuberculosis was based on active therapy rather than the negative steps formerly used

"In the early stages of the knowledge of tuberculosis," he said, "the treatment consisted largely of aiding nature to overcome the disease Choice of climate was believed to be of fundamental importance The principal aids were rest, fresh air and plenty of nourishing food Sanatoria were usually located either at the seashore or in the mountains

"As the knowledge of tuberculosis progressed, more intensive forms of medical treatment were gradually added until at present active measures of therapy are frequently resorted to, including surgical operations

"It has been found that active therapy can best be carried out in well equipped hospitals situated in communities where skilled surgeons and other medical authorities are available"

The new hospital will be of light gray brick with limestone trim The walls of the upper floors will be made of clear glass Most of the patients will be accommodated in six-bed wards, all of which will lead to balconies

On each floor will be three glass enclosed solaria, one at the center and one at each end Atop the wings will be open and closed roofs

It is expected that the hospital will be completed within a year after ground is broken It will be administered as a part of the Queens General Hospital but will have its own medical staff

Construction of a new building in the Riverside Hospital group on North Brother Island in the East River to expand the city's facilities for the treatment of pulmonary tuberculosis will be started soon, it is announced by Dr S S Goldwater, Commissioner of Hospitals

The addition will be a new building, to contain pathological and bacteriological laboratories, an x-ray department, operating and treatment rooms, a receiving ward and general ward accommodations for 150 beds With the addition Riverside will become an up to-date tuberculosis hospital of about 500 beds The building will consist of three floors and a basement.

Newsy Notes

CARL P WRIGHT, superintendent of the General Hospital of Syracuse and executive secretary of the New York State Hospital Association, urged State legislators on Feb 7 to defeat a bill which would repeal the section of the penal law which makes hospital strikes illegal

The bill was introduced in the Legislature by Senator Francis L McElroy of Syracuse

Wright said McElroy, a Democrat, joined with Assemblyman Frank Monasco, American Laborite of Brooklyn, in sponsoring the measure The penal law was invoked once to end a strike in the Brooklyn Jewish Hospital, he explained

"We regard this bill which the C I O has attempted to slip through the Legislature as one of the most iniquitous measures in years," Wright said "With all regard for the rights of organized labor, I am convinced that all thinking workers will recognize that consequences involved in tying up a hospital are far different from any ordinary labor troubles, since the lives of helpless patients are involved."

MATERNITY CASES AND VISITS to very young children formed the largest part of the work done last year by the 265 nurses on the staff of the Henry Street Visiting Nurse Service, according to a summary by Miss Katharine Faville, General Director

Operating from twenty-one centers throughout Manhattan, Bronx, and Queens, the Henry Street nurses made 545,000 visits during 1937

A SWINDLER POSING AS AN intern of the Bronx Hospital has been canvassing the Bronx asking for one dollar subscriptions for a mythical publication of the hospital The Bronx *Home News* has warned everybody who is approached to notify the hospital at once

At the Helm

THESE HOSPITAL OFFICIALS HAVE BEEN CHOSEN

Dr J Woods Price, to be president of the Saranac Lake Society for the Control of Tuberculosis, succeeding Dr Lawrason Brown, who died on Dec 26

Francis C Leupold, to be superintendent of Jamaica Hospital

Dr Allen Kane, to be director of the new division of tuberculosis of the New York City Department of Hospitals

Dr James D Hague, to be chief resident physician at the Monroe County Hospital

Walter L Johnson, to be chairman, and James H Carter, to be president of the trustees of Ossining Hospital, both reelected

Dr Frank A Calderone, to be district health officer in charge of the lower East Side health center in New York City, at 72 Cannon St, serving a population of about 300,000

Mrs E J Ashwell, to be president of the trustees and managers of the W C A Hospital at Jamestown, reelected

Milton J Fletcher, to be president of the directors of the Jamestown Hospital Service Corporation, reelected

Sister Domenica Maria, to be superintendent of Seton Hospital for Tuberculosis, Spuyten Duyvill Parkway, Bronx

Sister Agnita Miriam, to be superintendent of the New York Foundling Hospital at 175 E 68 St., New York City

Allan B Williams, to be president of the directors of the Olean General Hospital, reelected

Dr I E. Van Hoesen, to be president of the medical staff of the Memorial Hospital of Greene County

G L Cook, to be president of the Tompkins County Memorial Hospital Association, reelected.

Milton Solomon, to be president of the crippled children's division of the Jewish Sanitarium and Hospital for Chronic Diseases in Brooklyn

Frank B Twining, to be president of the managers of the Leonard Hospital in Troy, reelected

Lewis S Greenleaf, Jr, to be president of the Associated Hospital Service of the Albany district, reelected.

Dr Joseph P Lasko, to be president of the staff of Leonard Hospital at Troy

Dr Ray Palmer Baker, to be president of the directors of the Samaritan Hospital at Troy, reelected

Surgeon's Right to Discontinue Operation

A few weeks ago, a case was passed upon by an Appellate Court in a neighboring state in which the decision was one which should be of interest to all who practice surgery *

The action in question was brought against Dr O, on behalf of an infant, J H, and her father, L H The child it seemed had since the age of three suffered from head, nose, and throat trouble, which apparently had threatened to involve her lungs When she reached the age of nine, her mother took her, on the suggestion of the family doctor, to Dr O, a specialist and surgeon in such cases After thorough examination, he advised that "the child had an infected left antrum and he would have to perform a radical operation—make a hole in the mouth and cut away and remove the diseased tissue. Also, he would have to give five or six bronchoscopic treatments after the operation to clear up the chest."

The mother postponed the operation for a time by trying changes of climate for the patient, but about two years after the original consultation with Dr O arrangements were made for him to operate on the child A fee for the operation was agreed upon Dr O after postponing the operation for a few weeks in order for the patient to be put in a fit condition for the contemplated surgery had the child taken to a hospital Dr O was instructed by the parents "to act in his own best judgment." The mother signed a written consent to operation after its character had been explained

The operation was begun under an anesthesia and after it had progressed about thirty-five minutes, the surgeon recognized a condition described as "quite dangerous" and as "a crisis of pneumonia" so he deemed it inadvisable to continue with the operation The procedure thereupon was ended, before any attempt had been made to actually remove the diseased tissue In five days the child was taken home Thereafter the surgeon examined and treated the child from time to time for a period of about two years At the end of that time, the patient's mother discontinued Dr O's treatments and employed other physicians During the latter part of the said period of time he administered numerous bronchoscopic treatments to the child.

At sometime during the period after the attempted operation Dr O, according to the mother, stated to her "I would still like to go on with the work, the work still remains, the left antrum is still infected, I will continue with the operation—since that time the other side has been infected, that is, the right antrum" The mother however never permitted Dr O to make a further attempt at operation

Nearly six years after the operation, an action was brought by the child and her father against Dr O for damages based chiefly upon an alleged breach of contract It was contended on the part of the plaintiffs that the defendant, without right and illegally, had refused or neglected to complete the performance of the operation and remove the diseased tissue

Upon the trial the witnesses who testified in behalf of the plaintiffs brought out the facts to have been substantially as set forth above At the conclusion of the plaintiffs' case on defendant's motion the case was dismissed, and judgment was entered in favor of the doctor

The plaintiffs took an appeal from the judgment of the trial court and the Appellate Court affirmed the holding below In so deciding the Court said

> The undisputed proof, put in by the plaintiff, shows that the surgeon in so acting was within his rights, and performed his duty to his patient, considering that he found in the course of the operation that to continue it would endanger her life.
>
> Where, as here, the duly authorized representative of an infant patient has selected a surgeon to perform an operation under anaesthesia, and has appointed no other person to represent her during the period of unconsciousness, the law will, by implication, constitute the surgeon the representative of his patient and will cast upon him the responsibility of so acting in her interest that she shall receive the full benefit of his professional judgment and skill to which she is entitled, and this implication, which protects the surgeon while acting within its scope places no duty upon him to perform an operation that involves risks or results of a kind not contemplated

The Court in support of its decision, quoted from an earlier case as follows

> The question however, is one to be settled, not by authority, but by reason, and its im-

* Hanig v Orton, 195 Atl 812

portance is such that it touches at a vital point the interests of the entire public, any member of which may at any time suffer in life or health by the establishment of a rule that will paralyze the judgment of a surgeon and require him to withhold his skill and wisdom at the very juncture when they are most needed, and when, could the patient have been consulted, he would manifestly have insisted upon their being exercised in his behalf

With respect to the contention that defendant had failed in his obligation to continue the operation at a later date the Court said

The answer to that contention is that it ignores the undisputed facts The proofs show that the defendant properly continued from time to time to treat the child in both respects for a considerable period, until the child was removed from his supervision and treatment by the mother who engaged other doctors to continue such treatment. That this action of the mother was against the wishes of the defendant was disclosed by the proof (likewise put in by the plaintiffs)

Now the rule is that whenever, as here, one party to a contract prevents the other from carrying out the terms thereof, the other party may treat the contract as broken and abandon it. Such an abandonment is merely the acceptance of a situation created by the wrongdoer

Claimed Loss of Sexual Powers Following Herniotomy

A young man in his early twenties was referred to a physician who specialized in surgery with the request that he be operated for hernia The history received was that a number of weeks before the injuries had been sustained while the patient, in the course of his work, had engaged in lifting a heavy machine. The doctor found that the man was suffering from a bilateral inguinal hernia, and a few days later he had him hospitalized and under a spinal anesthesia the surgeon performed a herniotomy following a technic described as a modification of the Willys-Andrews herniоplasty After two weeks the patient left the hospital apparently with an uneventful recovery, and thereafter returned to the office of the surgeon on three occasions for routine examinations, covering a period of two months His recovery seemed to be complete and entirely satisfactory

About five months later a malpractice action was instituted against the physician who performed the operation in which the charge was made that in its performance he had in some manner injured the plaintiff and caused total loss of sexual power In the bill of particulars served somewhat later, the charge was made that defendant had injured the supply of nourishment to the testicles and the genital organs resulting in their complete destruction.

The case came on for trial before the court and a jury and the testimony in the case required four days for presentation Certain doctors who had examined the plaintiff prior to the operation, testified that his testicles were normal at that time, although at the time of trial there was no doubt as to the fact that the said testicles had become atrophied to about the size of a pea The defendant himself in his testimony conceded that when he saw the patient the testicles were normal in size There was also testimony that the plaintiff, when he went to the defendant, was suffering from a direct hernia on one side and an enlarged ring on the other side, in the face of defendant's testimony that the plaintiff had suffered from direct hernia on both sides and that said condition was the condition which he had operated upon

Plaintiff produced expert testimony supporting the theory that the operation which was performed upon him was not in general use at the time the defendant performed it and that it was one which incurred greater than usual danger of constriction of the spermatic cords Plaintiff's expert testimony was to the effect that during the operation both spermatic cords were constricted which led to causing atrophy of both testicles It appeared from the said expert testimony that at the time of trial the said testicles were completely atrophied and that there was no testicular tissue remaining which forever disbarred the plaintiff from sexual intercourse and consequently from procreation There was also testimony that the atrophy of the testicles would result in glandular changes to the detriment of the plaintiff

The defendant and his witnesses testified upon the trial that the operation performed by him was a proper one and that the atrophy complained of was due not to a constriction of the cords, but probably to some infectious disease, it being the contention of the defendant that had he constricted the cords as alleged, there would have been noticeable postoperative symptoms which were not in fact present

At the conclusion of all the testimony the Court submitted the issues in the case to the jury and a verdict was rendered in favor of the defendant thereby completely exonerating him of the charges of malpractice which had been brought against him

Plaintiff took an appeal to the Appellate Division of the Supreme Court from the judgment in favor of the defendant, and the said Court affirmed the ruling of the Trial Court A further application was made for leave to appeal to the Court of Appeals which was likewise denied, the jury verdict thereby remaining undisturbed by the Appellate Courts

their names! To make everything easy and save time, the chief agent notarized some petitions before they went out, and before a name was written on them Under questioning, she admitted that she did not know any of the persons who signed a petition she circulated herself, altho she swore that each signature was that of the person it purported to be As far as could be discovered during the inquiry, less than one per cent of the persons who signed the petitions were known to the individual circulators, so that a circulator's affidavit to the contrary was plainly worthless and not in compliance with Colorado law

That a slight doubt was felt about their own petition by the chiropractors was evidenced by the fact that before they turned it in, they struck out almost 3000 names, "for reasons best known to themselves" as the Colorado Secretary of State remarked in his decision.

So the gallant piratical craft of the chiropractors, breezing along full sail toward the November election, split wide open from stem to stern The Secretary of State, George E Saunders, has denied the proposed amendment a place on the November election ballot. True, his decision is still subject to review by the state courts, but competent attorneys have assured the State Medical Society that the decision will stand.

Colorado Doctors Have Made History

The Colorado doctors have done something more, too, than to halt this assault, iniquitous as it was Henceforth, declares the *Rocky Mountain Medical Journal,* it will not be possible for small groups of self-seeking individuals, who happen to have a few thousand dollars to spare, to buy a place on an election ballot by the simple means of employing petition circulators at so much per signature to catch as catch can every person walking the streets who is willing to sign his name Up to now this happy-go-lucky way of imitating legislation has never been challenged, but it is plainly out of line with the law "Until the present protest," we are assured, "led by the Colorado State Medical Society, was presented, no person or group ever attacked an initiative petition on the very substantial ground that circulators who stand upon street corners or in public markets and buttonhole every passer-by cannot truthfully swear to the required oath." So the doctors' victory makes history in Colorado

We may well recognize the fact also that if the chiropractors had won, they would have carried the campaign to other states, so that the Colorado men of medicine have been fighting the battle for all of us Now, says their editor, they are "confronted chiefly with the problem of paying the bills!"

Tablets for the Sore Throat of "Flaming Youth"

A PATIENT OF AN ENGLISH physician, a few weeks ago, on getting into his car, suddenly heard a hissing noise in his waistcoat pocket, and found himself on fire As the story is told in the *British Medical Journal,* he noticed two tablets of potassium chlorate which he had bought fall out in flames and set fire to the seat of the car He had a paper packet of twenty-five tablets in his pocket, and is not sure if he may not have had some matches there too, but thinks not. The doctor who tells about it recalls the case of a naval officer who had a similar experience a few years ago when he fell off a bicycle and some potassium chlorate tablets in a cardboard box in his pocket ignited He was severly burned. The editor of the *Journal* notes that a similar incident was recorded in its pages in 1929

A warning should be given to motorists and others not to carry the tablets loose in their pockets, says the English physician, Dr E F St. John Lyburn, of Hastings, and he adds that pharmacists usually instruct purchasers to handle them carefully "It is a simple matter to demonstrate the danger," he remarks, "by striking one of these tablets on the friction paper of a box of safety matches The paper, which contains phosphorus, causes friction, and the tablet is seen to flame up"

The tablets will also ignite under friction in the warm pocket without contact with matches or friction paper Potassium chlorate, adds the doctor, is also used in making detonators and explosives

A casual reading of the American drug-store journals reveals that they contain many hints to the wide-awake clerk, showing him how to "push" certain articles and make the unsuspecting customers buy two products instead of one Here, then, is a grand opportunity to sell with each packet of potassium chlorate tablets a handy fire-extinguisher

Across the Desk

Smashing Victory of the Colorado Doctors

THE INSPIRATION OF THE TOWERING peaks of the Alps, it is said, has filled the souls of the Swiss with such a passion for independence that they have been able for all these centuries to keep free. If true, is it not equally possible that the lofty crests of the Rockies, piercing the blue of Colorado's sky, should steel the spirits of her sons against the efforts of those who would rob them of their rights?

Explain it as we like, however, Colorado's embattled physicians have just won a notable victory over powerful forces that were making a bold attempt to break into the field of medicine without even the most elementary qualifications Another group has learned the danger of attacking the medical profession

The story of this threat to legitimate Medicine in Colorado was related in this department a few weeks ago under the heading "Freedom, What Crimes are Committed in thy Name!" For the hostile movement in Colorado proposed to add a "Health Freedom" amendment to the state constitution that would have raised merry hades, as it were, with medical practice and hospital service all over the state It was designed, so we are told in the *Rocky Mountain Medical Journal,* by a group of Denver chiropractors, and, if adopted, "would have repealed the Basic Science Law, and made it forever impossible to enact another" It would have knocked so many holes in the Medical Practice Act that it would look like a Swiss cheese, for "it would have permitted any sort of so-called healer, chiropractor, naturopath, yogi, quack, and what-have-you, to practice in every hospital that receives the slightest tax support." And not only so, but it would have let all these assorted "healers" into workmen's compensation and all other insurance practice, and no company could bar them out.

Things Looked Squally

Things looked pretty squally, for the chiropractors had got 52,000 names on their initiative petition for the "Health Freedom" amendment, where only 37,417 were required by law It seemed like a sure bet that this would put their measure on the ballot next fall—and then anything might happen

But right here is where the Colorado State Medical Society stepped into the picture, and things began to stir A committee of the society retained an able legal firm, and a formidable army of attorneys, detectives, investigators, handwriting experts, and clerical assistants fought the battle for eight long weeks Under their searching scrutiny the great petition began to crumble away

It turned out that the 52,000 signatures were obtained by a paid agent, who received three cents apiece for them, and paid two cents of it to circulators who secured them in any way they could. They went from door to door, or stood on street corners persuading passers-by to write their names on the lists

One circulator also testified that "she obtained the signatures for a great many people at the Loop Market with whom she was not acquainted, and that she did not and does not know that they were the persons whose names they purport to be."

Great Plan Piled up on the Rocks

That was the rock, in fact, upon which the great petition met shipwreck, for Colorado law requires that to each petition "shall be attached an affidavit of some qualified elector that each signature thereon is the signature of the person whose name it purports to be." The affidavits were supposed to be affixed to the sheets by the circulators who secured the signatures, and in some cases this was done, but when the investigators tried to find the circulators, most of them had disappeared and could not be traced

Those who were found confessed they did not know the people who signed, and many sheets were found to be sworn to by the chief agent in the central office, who had not even seen any of the signers write

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N Y Acknowledgment of receipt will be made in these columns and deemed sufficient notification Selection for review will be based on merit and the interest to our readers

The International Medical Annual. A Year Book of Treatment and Practitioner's Index Edited by H Letheby Tidy, M D and A. Rendle Short, M D Octavo of 605 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $6 00

Many of the leading physicians and surgeons of England again review the more important developments of the past year in this fifty-fifth appearance of the Medical Annual A book of this sort is difficult to review for it covers the specialties as well as the major fields To those who are anxious to keep abreast of advances and who feel that other reviews may not include what they seek, this volume will certainly prove useful

ANDREW BABEY

Textbook of General Physiology By T Cunliffe Barnes, D Sc Octavo of 554 pages, illustrated Philadelphia, P Blakiston's Son & Co, Inc, 1937 Cloth, $4 50

This recent book on general physiology by T Cunliffe Barnes, thoroughly up to date and supplemented with a wealth of references, is a highly commendable piece of work The method of presentation which departs from the more conventional pedagogical method and includes many brief allusions to recent research, should encourage the tendency of the undergraduate to seek information from original sources

The subjects of water metabolism and physical models of living systems have received special attention, and controversial evidence has been included to illustrate the unsettled nature of many physiological problems

The book may be divided roughly into two parts—the first dealing with the physical chemistry of living systems and the second with the external and internal factors which regulate the organism

Many of the illustrations in the book deserve special mention, not because of their contribution to art, but because of the contribution which art in its simplest form makes to the teaching of physiology Such illustrations as the one for the chloride shift, or the one showing the aspects of the cytochrome-oxidase system, change abstract ideas into concrete pictures for the average student

As a student textbook this work may be criticized by some physiologists on the ground that it leaves the student with a confusion of theories and ideas instead of a clear understanding of various subjects On the other hand, this fault may prove a virtue under the guidance of a good instructor through encouraging the student to read more original papers and to develop the ability to evaluate evidence for himself.

J RAYMOND JOHNSON

Skin Diseases in General Practice. Their Recognition and Treatment. By H Haldin Davis, M D Third edition Octavo of 400 pages, illustrated New York, Oxford University Press, 1937 Cloth, $6.25

The third edition of this book has been extensively revised The author writes, as his title indicates, for the general practitioner, and from this standpoint it may be considered a very helpful book.

The introductory chapter gives the anatomy of the skin, and a description of both primary and secondary lesions in as short and understandable a form as is possible. The next few chapters dispose of "Diseases due to Common Pyogenic Organisms", "Eczema", and "Syphilis", etc Following this the sundry common diseases are described according to their topographical distribution, which is a great aid to the one not well versed in dermatology All descriptions are in an easy reading style, not encumbered with involved pathological description, and are followed by suggestions or outlines for treatment It is to be noted that the author is not a faddist on diets, particularly in his treatment of eczema We would say that his therapy seems to be quite rational, although some of his drugs are peculiar to his own country, and are rather unfamiliar here

In the outline of treatment for syphilis, the reviewer feels that following the formulae laid down by the Cooperative Clinics is much safer and more satisfactory than the less than minimal treatment suggested by this author

A MAJOR ADVANCEMENT IN CIGARETTES

Patients with irritation of the nose and throat due to smoking were directed to change to Philip Morris Within a limited number of days not only did the *patients* report definite relief, but medical examination showed every case of irritation had cleared completely or definitely improved

This Philip Morris superiority* is due to a distinct difference in manufacture Philip Morris employs diethylene glycol as the hygroscopic agent—proved a major advancement in cigarettes.

Hospitals and Sanitariums

INSTITUTIONS SPECIALIZING IN TREATMENTS

Introducing

The Parker Sanatorium at Yonkers joins our growing section of private hospitals, sanitariums and nursing homes, with this issue

Physicians who have known of this institution will be interested to learn that it has moved to an even finer location, where a requirement for larger quarters is being fulfilled Here at a high elevation overlooking the peaceful Hudson, spacious grounds give promise of ideal outdoor possibilities for patients in the Spring, Summer and Fall seasons The privacy and quiet surroundings offer the right environment for Chronics and Invalids who require with proper care and treatment, a place conducive to rest and convalescence

A point that distinguishes this institution, is attractive rates that make the service within the means of many patients

The institution offers accommodations of three-bed wards, and semi-private or private rooms All treatments specified by the patient's physician are rigidly adhered to, and tray as well as dining room dietary service is available For those wishing to follow the dietary laws of their religion, special food arrangements are made

Physical and Occupational Therapy Departments are maintained

The institution invites correspondence requesting full data pertaining to facilities and rates, and assures physicians of close cooperation in extended care of their patients

STRICTLY
A
HIGH
CLASS
PRIVATE
SANITARIUM

recognized for 50 years by the medical profession

Restricted to a limited number of nervous and mental cases—not violent, dangerous, noisy, or otherwise objectionable—with special facilities for the care of aged and chronic cases

Environment and administration are such as affords the most beneficial atmosphere Contact with others is controlled through caring for the patients in suites (practically all with private baths) A fully qualified medical and nursing staff, physiotherapy hydrotherapy, massage, and occupational therapy in addition to attractive and modern buildings make "Falkirk in the Ramapos" one of America's most complete sanitaria

Convenience and accessibility in nearby accommodations and transportation for guests makes the location ideal The sanitarium and its program of treatment are so arranged that patients have greater comfort and service than found elsewhere

Students' Activities

Half way between work and play, various activities of the students are purely voluntary, yet are important in training them esthetically or culturally or in preparing them in other important ways for later life The boy or girl whose soul thrills to music has a source of pleasure that should be cultivated, and many schools have glee clubs, choirs, orchestras and bands where the student can have no end of good times and yet receive the right training There is nothing finer than fine music, and there is nothing much worse than bad music and the parents of a student musically inclined will do well to look into this part of the school life

Another student activity is the school paper or magazine Many a successful writer has made the start on a school publication For that matter, however, everyone, even in the most every-day business life, has more or less writing to do, and work on the student periodicals, in school and college, gives ease, fluency, and facility in handling our sometimes rather balky language The pleasure of being able to dash off a rattling good story or a humorous or serious bit of verse is also one of the joys that help make life worth while.

Debating has in it the fun of a good fight, and brings out the splendid qualities of fast, vigorous thinking, quick repartee, ability to capture and hold an audience, and the rare capacity to take defeat with a smile All these qualities are invaluable in any kind of career, and a school with well-trained debating teams is the place to develop them.

School athletics can be the making of a boy —or his ruination He can learn to be a good sport on the playing field—or a poor sport And what he learns there is very likely to color his whole life We all remember the great President who said "Don't flinch Don't foul Hit the line hard!" There is a motto to carry us through good times and bad times, and it can be learned on the playing field better than anywhere else

This is a side of school life that parents sometimes fail to consider, but it may turn out to be of prime importance Don't overlook it

Great Western

AMERICAN WINES

When a patient requires a superior champagne *during convalescence* specify "Great Western"

Produced since 1860 in the Finger Lakes region of New York, from grapes grown under soil and climatic conditions matching those of the great wine-producing regions of France, Great Western wines have been well recognized by the medical profession

All Great Western Champagnes are made by the old French method of secondary fermentation in the bottle They thus possess the optimum carbon dioxide content Yet Great Western sells at a most reasonable price

GREAT WESTERN WINES

Vermouth Dry and Sweet

Champagnes Dry, Medium and Sweet The American champagne that won medals in Paris, Brussels and Vienna

Still wines (under 14% alcohol) Sauterne Rhine, Claret, still Burgundy

Still wines (18% alcohol) Sherry Port Tokay Sweet Catawba Muscatel

PLEASANT VALLEY WINE COMPANY

Rheims, N Y.

NOTES FROM ADVERTISERS

On Hypnotic Drugs

The "sleeping potions" of an earlier day were often linked with evildoing, and plants having hypnotic powers were regarded with superstitious fear Shakespeare mentions the shriek which was said to emanate from the mandrake (mandragora officinarum) as its roots were torn from the earth and which caused all mortals who heard to run mad.

Hypnotic drugs, now thoroughly understood, have become an integral part of modern therapy Quiet, restful sleep is procurable through the use of 'Amytal' (Iso-amyl Ethyl Barbituric Acid, Lilly), and the drug is given with a feeling of safety based upon its broad background of clinical use.—*Adv*

Travel and Resorts

Bermuda's St George Reopening With Gala Pre-Easter Season Planned

Completely redecorated and with many added improvements the St George Hotel Beach and Golf Club will reopen Monday, March 14 for the Spring and Summer, with an extensive program planned for the pre-Easter holiday season, it has been announced by Robert D Blackman, General Manager of the Furness-Withy properties in Bermuda One of Bermuda's most popular resorts, the St. George is a resort within itself, combining all the vacation features of the island and embracing one of its finest beaches—St. Catherines

Ultra modern in equipment and furnishing, the hotel itself is a vast rambling structure overlooking the blue waters of St. George's Harbour on one side and the rolling juniper hills on the other Only a short distance away is the quaint 17th Century town of St George's, one of the features of the islands St George's swimming pool is the largest in Bermuda, while its golf course, designed by Devereux Emmett, is one of Bermuda's most picturesque.

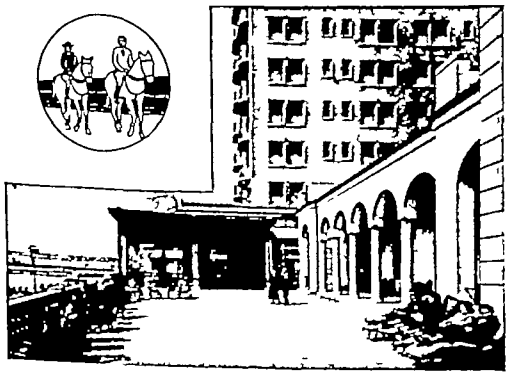
Sherlock Holmes Irked His Author

Conan Doyle hated his brain-child, Sherlock Holmes, according to Hesketh Pearson, noted British biographer

This paradox, which parallels Ford Maddox Ford's revelation that Joseph Conrad hated the sea, and Rudyard Kipling's statement to a Canadian newspaper man that "I know nothing about India," appears in a recently published travel book, Skye High, in a dialogue between Mr Pearson and Hugh Kingsmill, who toured Scotland together over the line of the London, Midland and Scottish Railways

"While on the subject of Sherlock Holmes," Mr Pearson remarked, "did I ever tell you that his creator, Sir Arthur Conan Doyle, hated him?"

"How d'you mean?" asked Mr Kingsmill



"I once wrote a longish article on the Holmes saga for G K C 's paper, in which I said that Holmes was among the few immortal characters in English literature one would like to

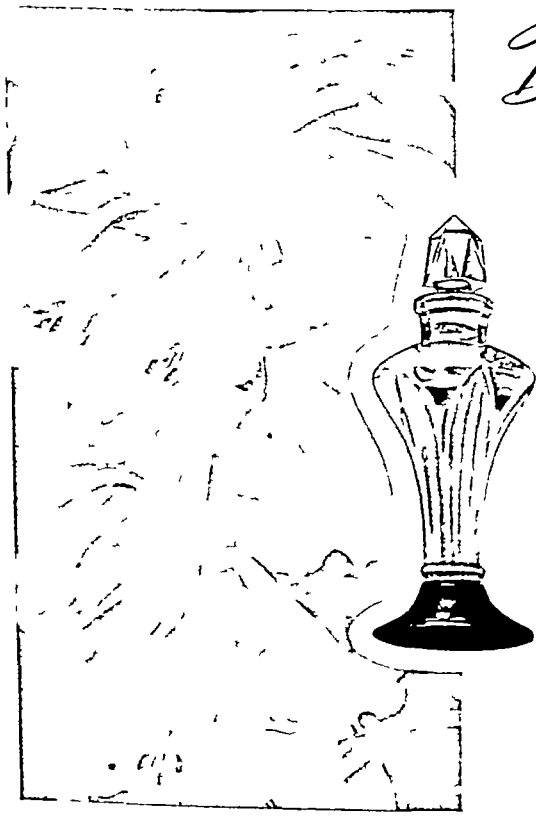
meet. Doyle was apparently much pleased, because he wrote to thank me very heartily for what I said, but he also confessed that he was sick to death of Holmes and sometimes wished he had never created him"



"Because the popularity of Holmes had prevented a proper appreciation of his serious historical romances, meaning, I suppose, The White Company, Sir Nigel, etc He added that Sullivan had suffered in the same way, his popular stuff, done to Gilbert's words, had killed him as a serious musician"

"But what," Mr Kingsmill asked, "did you reply to Doyle?"

"I accused him of ingratitude He had been able to give endless pleasure to thousands of people, myself among others, who had amply repaid him He was in fact a very lucky author I dismissed his 'serious historical romances' as uninteresting, like Sullivan's serious music, and begged him to give us some more of another character, in certain respects better even than Holmes himself—Brigadier Gerard"

Hesketh Pearson, actor, war-time army cap-

* * *

Kingston, Jamaica

The "dual personality" of this island in the heart of the Caribbean is something which visitors from northern countries find hard to believe until they have seen with their own eyes.

Jamaica has the unique distinction of being a beach playground, circled by broad and glistening coral strands, on the one hand, and a land of towering mountains, on the other Of the mountains, comparatively little of their attractiveness has been publicized, and some of them are almost inaccessible.

Like the other smaller islands of the West Indies, this isle is the very top of a submerged range of mountains, which rise out of the sea as the last vestiges of a remote age. The contour of the land was quite aptly described nearly 400 years ago by its discoverer, Columbus, who, in telling his queen, Isabella, about it, crumpled a piece of paper in his hand to make an impromptu relief-map

With hotels and guest houses at altitudes as high as 4,000 feet, Jamaica has the most developed mountain resorts in the West Indies A military cantonment, Newcastle, is also situated high in the mountains, which offer exquisite scenery and a remarkably equable climate The mean temperature varies only slightly throughout the year at altitudes of 2,000 and 5,000 feet, according to a report contained in the official Guide to Jamaica, just published by the Jamaica Tourist Trade Development Board, which states that at 2,000 ft., the mean is 72 degrees Fahrenheit, while that of 3,000 feet is only 62 4 degrees Blue Mountain Peak, the highest point in Jamaica, is 7,388 feet above sea level

Decoration Day Air Trip To Bermuda

During the Decoration Day week-end the Imperial Airways flying boat Cavalier, regularly engaged in the Bermuda-United States air service, will make a special flight from Port Washington, Long Island, to Bermuda, allowing time for the passengers to spend three nights and two and a half days in this Atlantic paradise.

The Cavalier will leave Port Washington on Saturday, May 28th, at 9 30 a m, arriving in Bermuda at 2 30 p m, five hours later She will leave Bermuda early Tuesday morning, May 31st, making it possible for business men to be at their desks in New York by lunch time on Tuesday

The projected air cruise will be limited to 21 passengers, the capacity of the Cavalier The round trip rate will be $150

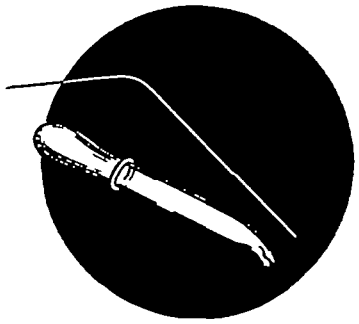
"What's behind the label"

—*concerns you most*

As a professional man you realize better than the layman that foods are not alike merely because they come in similar containers Because the human body does not respond promptly by showing accurately the effects of food taken in, many consumers (perhaps your patients) think that one brand is as good as another—that satisfaction of appetite is the only object to be achieved

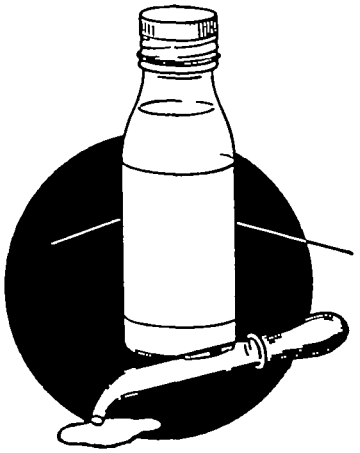
The high quality of fruits and vegetables used, the sanitary equipment and careful handling combine to make Wegner's different and a dependable product for your everyday use or dietary recommendation



Packed in HOSPITAL and INSTITUTION Size Containers

Prices on Request

WEGNER CANNING CORP.
Sodus **New York**



PERCOMORPHUM
n the 50 cc. size with the

3. Unbreakable

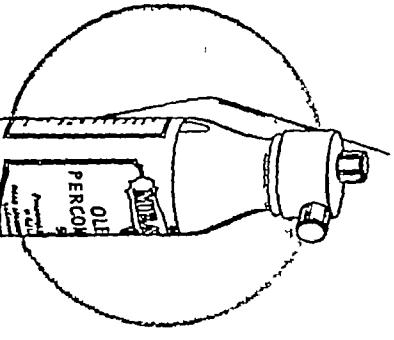
Mead's Vacap-Dropper will not break even when ne bottle is tipped over or dropped. No glass ropper to become rough or serrated.

4. No "Messiness"

Mead's Vacap-Dropper protects against dust and incidity. The surface of the oil need never be xposed to light and dust. Nor is there any hance for dropper to roll about and collect bac-eria or for oil on it to become rancid from epeated exposure to light and air.

5. Accurate

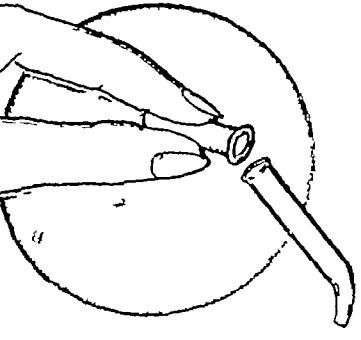
his new dropper, after the patient becomes ccustomed to it, delivers a uniform drop.



How to Use
MEAD'S *Vacap-Dropper*

move top cap and side cap Wipe dropper tip Regulate rate of w by using finger to control entrance of air through top opening e Illustration No 5) Oleum Percomorphum is best measured into e child's tomato juice. This is just as convenient and much safer an dropping the oil directly into the baby's mouth, a practice uch may provoke a coughing spasm

LEUM PERCOMORPHUM
nore economical now than ever



☆ OLEUM E
is now supplied it
new *Vacap-Dropper**

1. Economical

There is no loss of oil if the bottle is accidentally upset. As Mead's Vacap-Dropper need never be removed from the bottle, there is no danger of spilling valuable oil and soiling clothing or furnishings.

2. No Deterioration

Made of high grade bakelite, Mead's Vacap-Dropper is impervious to oil. In warm weather, oil often rises up into the rubber bulb of ordinary medicine droppers, initiating a chemical action which eventually deteriorates both oil and rubber. With this unique device, there is no glass or bulb to become separated while in use.

*Mead's Vacap Dropper is supplied with the 50 cc size of Oleum Percomorphum which patients find economical in use The 10 cc size continues to be supplied with the ordinary type of dropper (U S Pr Nos 2105023 and 101575)

tically Marketed
Not Advertised
to the Public

OLEUM PERCOMORPHUM is an economical source of vitamins A and D 100 times as potent as U.S.P cod liver oil For the prevention and treatment of rickets and tetany, to prevent poor dentition due to vitamin D deficiency; for pregnant and lactating women, for persons on restricted diets, to aid in building general resistance lowered by deficiency of vitamin A, and wherever cod liver oil is indicated

Allergic PATIENTS

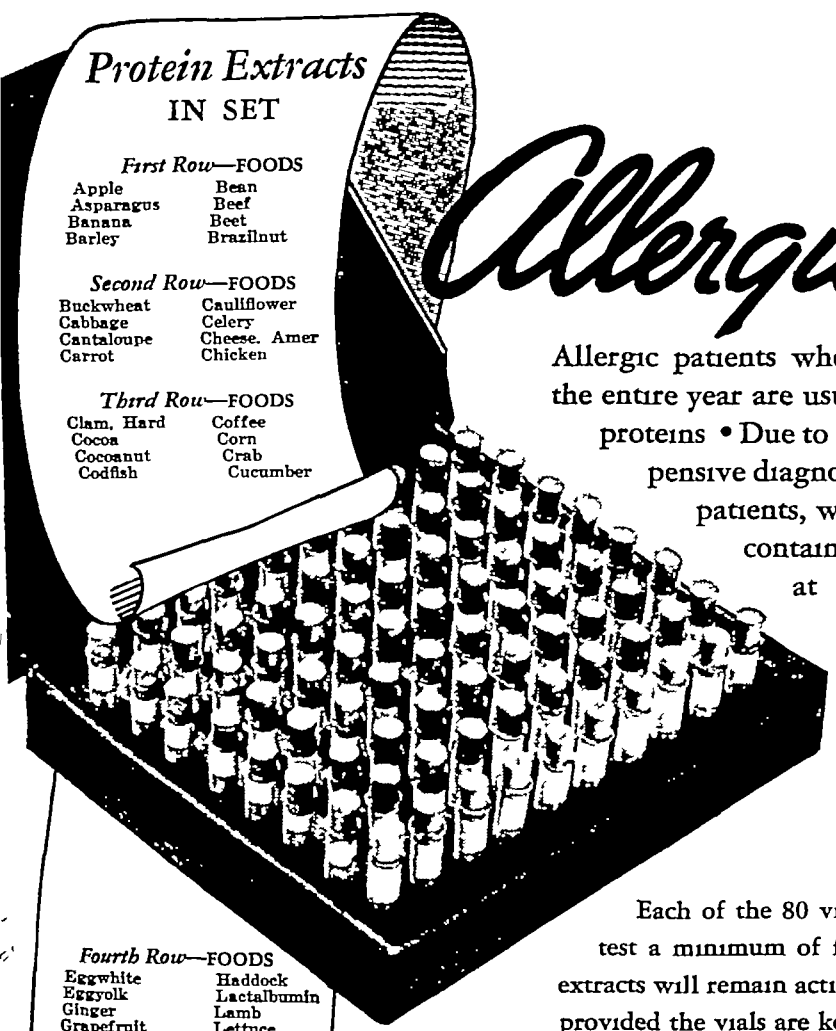
Allergic patients who manifest symptoms durin the entire year are usually sensitive to one or mor proteins • Due to constant demands for an inex pensive diagnostic protein outfit to test thes patients, we wish to announce a new se containing 80 protein extracts (liste at the left) at the sensationa price of

$9.75

Each of the 80 vials contains sufficient material test a minimum of five patients These dried prote extracts will remain active for years, at room temperatur provided the vials are kept properly corked

This new low price now makes it profitable for eve physician to have at his immediate disposal a diagnost set for the cutaneous testing of allergic patients sufferi from ASTHMA-MIGRAINE-URTICARIA-ETC.

Full instructions and a vial of diluent included wi each set.



No substitution will be allowed in the list of prote extracts making up this set. Due to reduced price, cash full must accompany order

for reducing
CEREBROSPINAL FLUID PRESSURE

Cheplin's

Sucrose, U.S.P.

50% SOLUTION

Recent clinical experience has definitely established a preference for the use of sucrose in reducing abnormally high cerebro spinal fluid pressure, over other hypertonic solutions Sucrose, unlike sodium chloride and dextrose, has no toxic effect and is less marked in secondary rises of the pressure

Its use is indicated in coma, stupor, or intense headache from intracranial growths, edema of the brain following cerebral trauma and other causes such as uremia and alcoholism

Supplied Unbuffered —in 50 cc and 100 cc ampules or vials 6 25 or 100 per box.

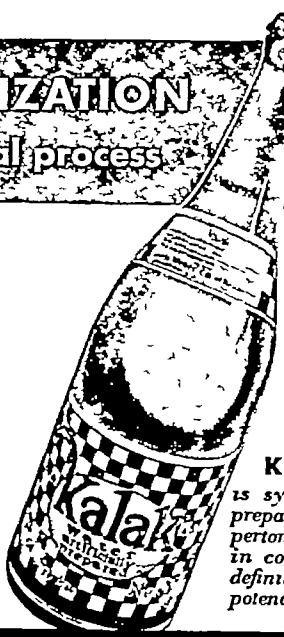
TO EYE PHYSICIANS:

We, Fryxell & Hill, Inc , extend to you a cordial invitation to visit our exhibit

BOOTH No. 305

at your Annual Meeting



for inspection of our new Hand Slit Lamp, which has been received very favorably by a number of Eye Physicians of New York City

May we anticipate the pleasure of meeting you there

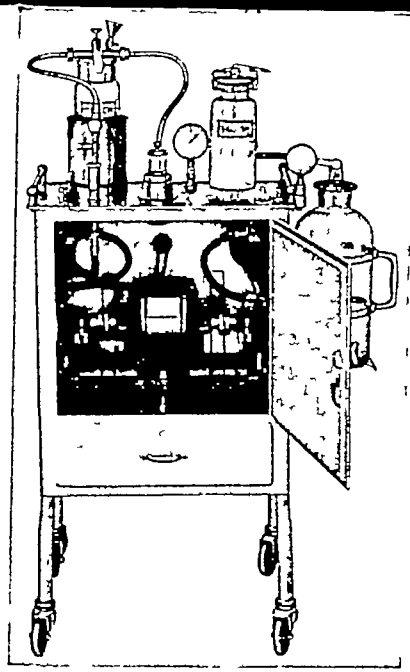
47 E 57th Street, New York

BUFFERED ALKALINIZATION

by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)



Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy

KALAK

is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

KALAK WATER COMPANY OF NEW YORK, INC., 6 CHURCH STREET, NEW YORK CITY

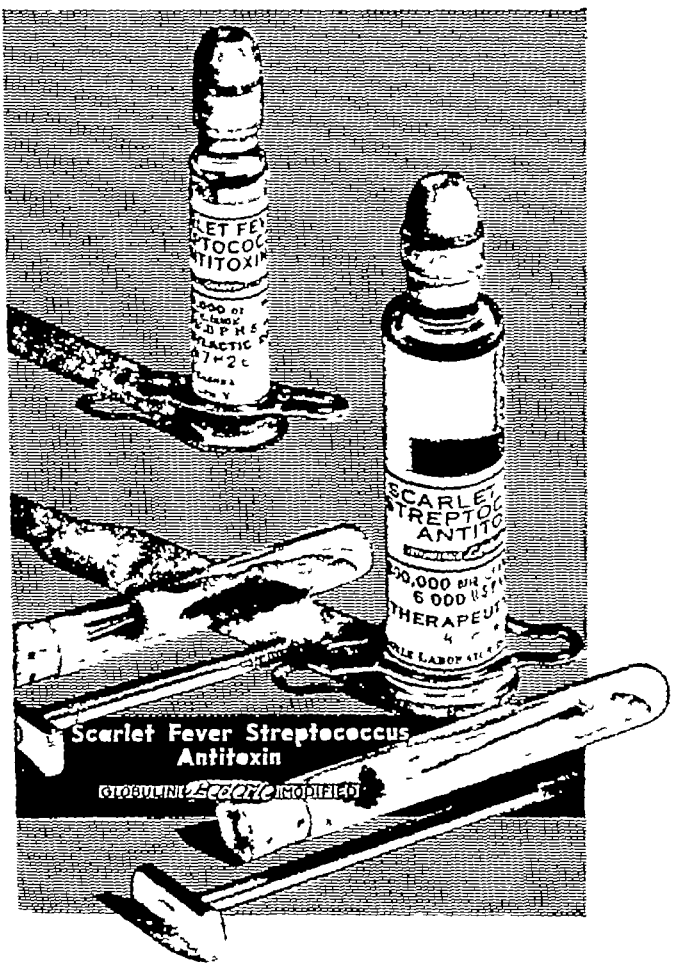
Reducing the risk

of severe serum reactions in

SCARLET FEVER ANTITOXIN THERAPY

TIME WAS WHEN PHYSICIANS confronted with a case of scarlet fever felt themselves in a dilemma The use of antitoxin meant a serious risk of serum reactions, withholding it left the patient in danger



Antitoxin was, therefore, frequently given only in severe cases, with the result that many of the milder cases progressed to the severe form of the disease, with a lower expectancy of effectiveness of serum therapy when instituted late

The advent of Globulin Modified Scarlet Fever Streptococcus Antitoxin *Lederle* has changed the old attitude towards antitoxin therapy This potent antitoxin with its greatly reduced liability to cause reactions is now being widely used regardless of apparent mildness of attack The decrease in the incidence of serious complications alone, aside from the favorable effect on the prognosis, far over-balances the lingering hazards involved in the 2% incidence of severe serum reactions following the use of this antitoxin

Scarlet Fever Streptococcus Antitoxin (Globulin Modified) *Lederle* is available in appropriate packages for both prophylaxis and therapy

Lederle

Visit Lederle booths No 77 & 78 where products for Pneumonia, Anemia and Allergic diseases will be featured at the 132nd annual meeting of the Medical Society of the State of New York, Waldorf Astoria Hotel, N Y May 9 12.

Two million sufferers . . . 80 per cent. will be benefited by proper

HAY FEVER TREATMENT

THE INCIDENCE OF HAY FEVER has been variously estimated as between 1 and 2 per cent of the population of the United States Some recent estimates are even higher Thus there are about two million hay fever sufferers in this country

Clinical reports indicate that at least 80 per cent of the cases will obtain satisfactory relief following properly managed pollen therapy

With the development of Lederle's glycerolated pollen extracts, the testing and treatment of pollen sensitiveness have been simplified and improved

A single diagnostic scratch test usually suffices to classify the patients according to their constitutional sensitivity, and to indicate the size of the dosage

"Pollen Antigens *Lederle*" have shown no measurable deterioration after six years Physicians will therefore find it advantageous to keep on hand a supply of diagnostic tests (each package contains sufficient material to test 3 individual cases) The scratch test may be performed at any season and treatment by the preferred perennial method commenced at any time

Send for Hay Fever Manual

VINETHENE

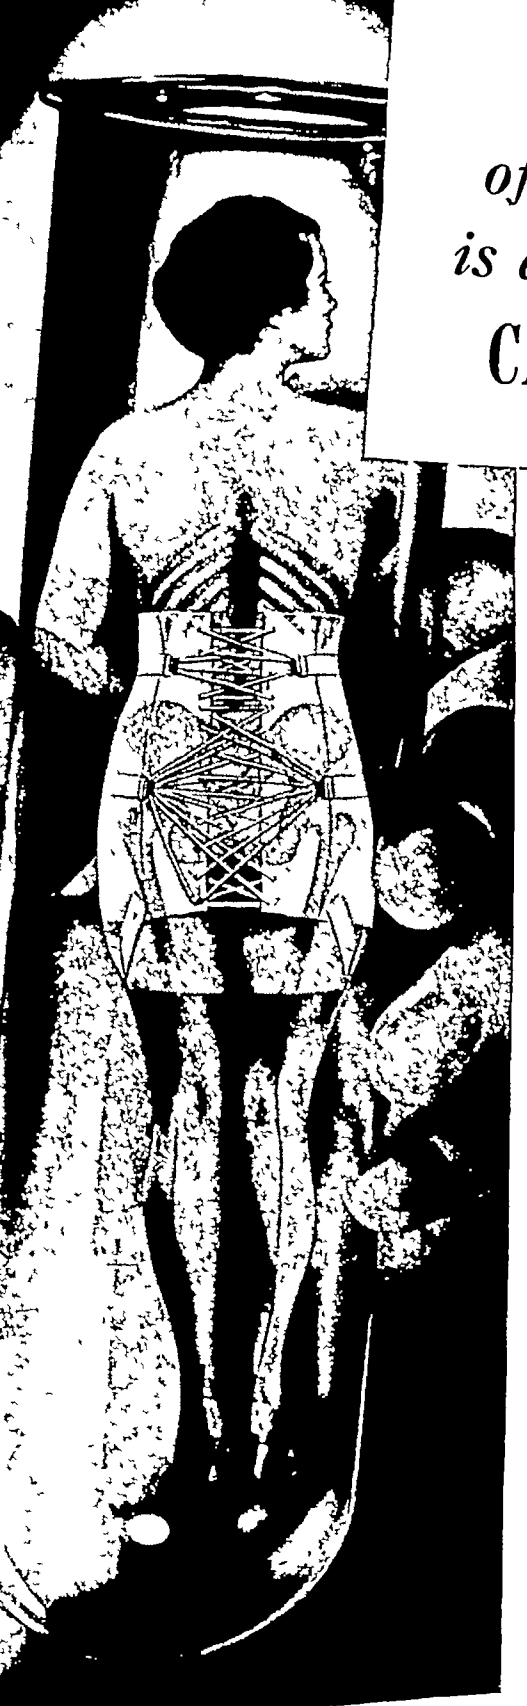
Reg. U.S. Pat. Off.

Vinyl Ether for Anesthesia Merck

ACCEPTED AMERICAN MEDICAL ASSN.

Extensive clinical trials have established the value of Vinethene for short anesthesias in which rapid, easy induction and prompt recovery with a minimum of post anesthetic effects are desired

Vinethene may be used to advantage, either in the home or in the hospital, for



Reduction of fractures ★ Manipulation of joints ★ Dilatation and curettage ★ Myringotomy ★ Repair of perineal lacerations and other short obstetrical procedures ★ Changing of painful dressings ★ Incision and drainage of abscesses

Vinethene is supplied in bottles of 25, 50, and 75 cc. and in small containers convenient for the physician's bag—boxes of 3—10 cc vials with a special dropping cap

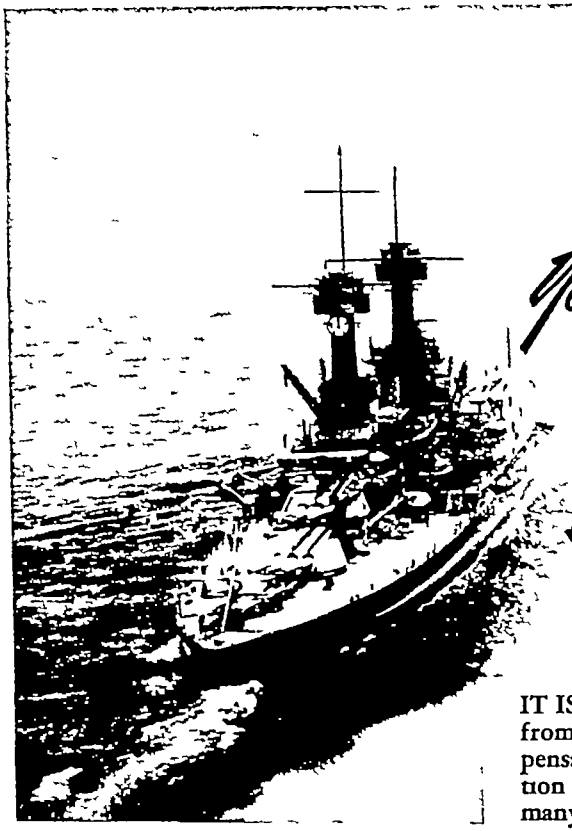
LITERATURE ON REQUEST

MERCK & CO. Inc. *Manufacturing Chemists* RAHWAY, N. J

Say you saw it in the N Y S Jour of Med. of April 1 1936

The experience of many specialists is embodied in every CAMP SUPPORT

WHEN a chemist prepares a formula he must know the content and purpose of every ingredient used In the same way, S H Camp & Company are thoroughly versed in every detail that contributes to the efficiency of a Scientific Support The quality of the exclusive fabrics—the spacing of eyelets, the intricate lacing, the resiliency of the garters, the effectiveness of each tiny snap—all are subjected to expert analysis and careful laboratory research before they are accepted



The anatomical correctness of each Camp garment is assured through the cooperation and advice of specialists in each branch of the profession For example, the sacro-iliac support illustrated was designed and constructed on advice of leading orthopedic specialists Two sets of lacers with separate adjustments assure increased tightness low on the trunk and such staying power as is required above Camp Maternity Supports are the result of constant research work and consultation with obstetricians. In addition to protecting the abdominal walls, back and pelvis from strain, Camp Maternity Supports help the patient maintain her balance Camp Supports for postoperative, mammary gland, visceroptosis, hernial and other conditions are based on similar expert knowledge

As a result of this thorough, painstaking policy of seeking authoritative advice on even the small details, Camp Supports are approved by the American College of Surgeons and accepted by the Council on Physical Therapy of the American Medical Association

You don't need to swing ship if it's a "HINDLE"

IT IS a nautical custom to "swing ship" from time to time to check the compensation necessary for compass deviation To be certain of their accuracy, many other types of instruments require some such periodic checking against a basic standard The necessity for such an accuracy check with an external standard is obviously undesirable in an Electrocardiograph

It is a different story with the "Hindle" Electrocardiograph—because it is in itself a *primary standard* incorporating the fundamental Einthoven Galvanometer as its current responsive element The science of Electrocardiography in this country was developed largely upon the "Hindle" Electrocardiograph—it is therefore the *standard of comparison*

You do not have to "swing ship" on your Electrocardiograph—*if it is a Hindle!*

All Electric models are made in Stationary, Mobile and Portable types for hospitals, clinics and private offices

Especially Satisfactory for Surface Anesthesia

EYE . . NOSE . . THROAT

CLINICAL investigations have shown that Pontocaine Hydrochloride is eminently suitable for surface anesthesia of the nose, throat and eyes It is characterized by a high degree of penetrability and prolonged action, and because of the low concentration in use, the possibility of irritation is greatly reduced When supplemented by Suprarenin (synthetic epinephrine, Winthrop) the effect of Pontocaine Hydrochloride is sufficiently deep and prolonged for the numerous procedures usually carried out under surface anesthesia.

HOW SUPPLIED

For *rhinolaryngology* Pontocaine Hydrochloride 2 per cent solution in bottles of 1 oz. and 4 oz. For *ophthalmology* Pontocaine Hydrochloride 0.5 per cent solution in bottles of ½ oz. and 2 oz. Also Pontocaine Hydrochloride tablets 0 1 Gm. tubes of 15 and bottles of 100 and Pontocaine (base) Eye Ointment 0 5 per cent. collapsible tubes.

A few CIBA contributions TO MODERN THERAPY

DIAL

● A powerful sedative and hypnotic which is effective in smaller doses than barbital, U S P The sleep induced is calm and refreshing, awakening unclouded In therapeutic doses Dial has no untoward effect Administered orally or intramuscularly Indicated in insomnia from various causes

Tablets · Powder · Elixir · Ampules

NUPERCAINE

● Provokes rapid local anesthesia of remarkable intensity and duration in higher dilutions than cocaine, procaine, etc Not subject to Harrison Law restrictions Indicated for topical application, infiltration, and spinal and caudal anesthesia

Ampules · Powder · Tablets · Solution

DIGIFOLINE

● A biologically-assayed, uniform preparation of digitalis free from inert and undesirable extractive substances Contains the essential cardio-active glucosides of digitalis leaf Administered orally, or, when rapid action is desired, intramuscularly or intravenously Each tablet, each ampule, each c c. of liquid equals one cat unit

Tablets · Liquid · Ampules

VIOFORM

● A useful agent administered orally in the treatment of amebiasis Designed also to replace iodoform, for external use, which it surpasses in antiseptic power and freedom from unpleasant odor Non-irritant Checks suppuration, maintains asepsis and so aids in healing

Powder (in sprinkler-top cans, bottles and tins)

CIBA PHARMACEUTICAL PRODUCTS Inc., Summit, N. J.

INTERMITTENT VENOUS OCCLUSION

A NEW and PROVED METHOD of TREATMENT for PERIPHERAL VASCULAR DISEASE

BEFORE Thromboangiitis obliterans ulcer seven years duration, unable to heal by any other method of treatment

AFTER Completely healed in five weeks by Intermittent Venous Occlusion with *COLLWILL APPARATUS*

TESTED and CORROBORATED—
by intensive clinical experience—these remarkable results in treating

- PERIPHERAL VASCULAR SCLEROSIS
- DIABETIC GANGRENE
- THROMBOANGIITIS OBLITERANS
- INTERMITTENT CLAUDICATION
- CHRONIC INTRACTABLE VARICOSE ULCERS
- FROSTBITE
- EMBOLUS AND THROMBOSIS

Many cases despaired of therapeutically have responded to this simple method which produces alternate periods of congestive and reactive hyperemia in accordance with the Bier and Lewis principles

Low cost, simple application and complete automatic control make the COLLWILL INTERMITTENT VENOUS OCCLUSION APPARATUS suitable for office and hospital

*Collens and Wilensky J.A.M.A. 12/29/36

In Biliary Tract Disease

Decholin

Reg U S Pat Off

Assures Therapeutic Utilization of the TOTAL QUANTITY ADMINISTERED because it is a Single Chemical Entity in C. P. Crystalline Form

Decholin—chemically pure dehydrocholic (triketocholanic) acid—increases bile secretion by the liver cells as much as 200%, and appreciably augments gallbladder evacuation Inspissation of bile, nidi of infection, and gallbladder stagnation are thus overcome, producing prompt improvement. Decholin is of recognized therapeutic value in chronic cholecystitis, hepatitis of toxic origin, noncalculous cholangitis, and biliary insufficiency Comprehensive literature on request.

How the Deaf Hear with
CORONATION ACOUSTICON

This diagram of the ear will help you explain both bone conduction and air conduction to your patients. Interestingly colored it will look very attractive on the wall of your office We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• **A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD,** the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• **SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE** for custom fittings on the Aurogange and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service.

• **HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS,** but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye-glasses. Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations Send us the names and addresses of these "hard to convince" patients Of course, your name will not be mentioned in our correspondence with them—unless you say so

See Acousticon at the Waldorf-Astoria

"Master" elastic stocking

The superior effectiveness of the Pomeroy **hand-woven** "Master" Elastic Stocking over any **machine-made** stocking is due to the all-over, uniform pressure that restores circulation because it supplies correct, controlled compression throughout Each "Master" Stocking is woven to individual measurements No "stock" or machine-made stocking can ever give the correct and lasting satisfaction assured in every "Master" Elastic Stocking by Pomeroy. Because of their correct and continuous support and because they retain their original elasticity during long use, "Master" Elastic Stockings are really economical

Each Pomeroy office has a complete service available to every wearer of a Pomeroy surgical appliance whenever and as long as such service is desired

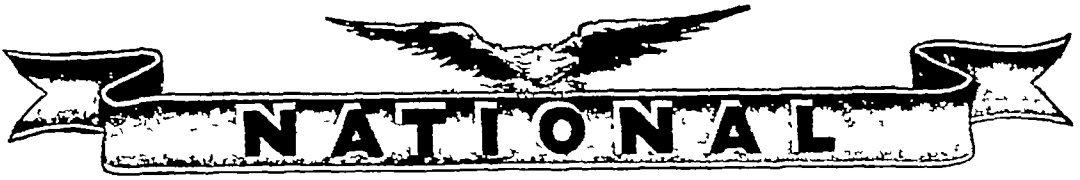
LIPIODOL LAFAY

A DISTINCTIVE

CONTRAST MEDIUM

PRODUCING SHARP, UNDISTORTED RADIOGRAPHS

The choice of a suitable contrast medium often determines the value of the diagnostic-data which it yields. Lipiodol Lafay, a true iodized oil, representing an organic, stable combination of 40% iodine with poppy seed oil, has numerous advantages



Its essential features may be summarized as follows —

1 The original French iodized oil
2 Contains no chlorine
3 Light amber color — helps detect deterioration
4 Bland and well tolerated even by delicate tissues
5 Relatively non-irritating, non-toxic
6 Precise, clear cut, sharply outlined radiographs
7 Facilitates diagnosis of many obscure conditions
8 Reveals pathologic conditions *which ordinary radiographs cannot* visualize

E. FOUGERA & CO, Inc • *Distributors* • 75 Varick St, New York

LIPIODOL (LAFAY)

COUNCIL ACCEPTED

SCARLET FEVER ANTITOXIN (NATIONAL)

A REAL ACHIEVEMENT IN HIGH GLOBULIN CONCENTRATION AND REFINEMENT: (Refined and Concentrated Globulin)

Refinement and concentration of the globulin fraction reduces volume 75 per cent and decreases serum reactions because of low content of non-essential serum proteins

Lessens pain of injection

Smaller volume is more quickly absorbed

Gives quicker therapeutic response

PROPHYLACTIC DOSE

2,000 Units National Inst of Health (100,000 original neutralizing units) are contained in ½ cc volume

THERAPEUTIC DOSE

6,000 Units National Inst of Health (300,000 original neutralizing units) are contained in 1½ cc volume

Each prophylactic and therapeutic dose contains 30 per cent excess units to insure potency beyond expiration date stamped on each package Furnished in sterile syringes, with rustless (chromium) steel needles and adaptor

The advantages of a highly refined and concentrated Scarlet Fever Antitoxin should materially increase its use for prophylaxis (passive immunity), and for the treatment of scarlet fever patients

Write for literature on Scarlet Fever Antitoxin (National)

WHY SO MANY DOCTORS PREFER

Ralston Wheat Cereal

Ralston Cooks Quickly—is completely digestible, thoroughly cooked in only 5 minutes over an open flame, thus providing all the advantages of a hot wheat cereal with a minimum of effort.

Supplies Abundant Vitamin B Enriched with pure wheat germ, Ralston supplies 1½ International units of vitamin B in each gram Consequently each serving assures generous quantities of this vitamin so essential to normal appetite and digestion

Appeals to Adults and Children. Made of premium whole wheat (with only coarsest bran removed) Ralston has a rich appetizing flavor that appeals to persons of all ages This simplifies the preparation of breakfast in both home and hospital

Costs So Little—less than 1¢ for a generous serving.

Research Laboratory Report and samples of Ralston Wheat Cereal will be sent on request. Use the coupon

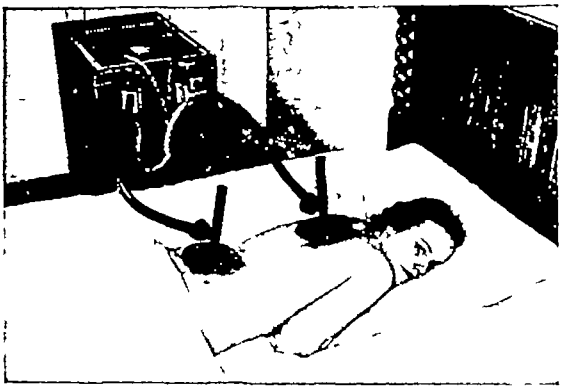
(This offer limited to residents of the United States)

Useful... IN MANY INVALID AND CONVALESCENT DIETS

RIPE BANANAS are a natural, soft, bland food... with a delicate flavor... popular with most persons... nourishing. easily digested. . mildly laxative... non-irritating. do not readily ferment in the intestines .. create intestinal conditions unfavorable to the growth of putrefactive bacteria... yield alkaline mineral residues in the body.



Because of these attributes, together with their soft fibre, pectins, high content of sugars, satiety value, low content of protein and fat, their vitamins (good source of A-B-C-G) and essential minerals, ripe bananas are prescribed by an increasing number of physicians in many invalid diets, including· ulcerative colitis, peptic ulcer, cardiac; diabetes; liver disorders, nephritis, tuberculosis, as well as in various post-operative and convalescent diets

In the field of corrective diets, physicians are finding that ripe bananas help combat both diarrhea and spastic constipation, also that in combination with milk they constitute a basis for planning a variety of effective, safe reducing diets for persons who are overweight

Vitamin Therapy Takes an Important Step Forward

THE WAY in which the medical profession has ever kept abreast of scientific research in the important field of vitamins, has been a striking demonstration of its alertness to new concepts

Following the discovery of vitamins by Dr Funk in 1912, doctors everywhere were quick to seize on the first commercial concentrate of A and D, made available by Funk and Dubin in 1923 In following years, as new vitamins were discovered, they have been promptly added to the physician's armamentarium. Their influence on the modern development of nutritional science has been of the highest significance.

Today the history of vitamin therapy takes another important forward step with the recent discovery of the cooperative interdependence existing between vitamins and minerals In V1-Syneral, Funk and Dubin have made available a potent concentrate of the six known vitamins—A, B_1, B_2(G), C, D and E —fortified with eight essential minerals—calcium, phosphorus, iron, copper, manganese, iodine, magnesium and zinc.

The superior efficacy of this multiple vitamin-mineral concentrate over mere A-D, A-B-D-G, or even A-B-C-D-G preparations, has been strikingly demonstrated by laboratory tests by Dr. Walter H. Eddy at Columbia University.

Nor have physicians been slow to prescribe the latest scientific Funk-Dubin contribution as a means to corrective diet insurance, and as an aid in the recovery of optimum health and vitality. Clinical reports from all parts of the country attest to the gratifying response to this modern metabolic stimulant

V1-Syneral is available in Funk-Dubin balanced potencies for all age groups The usual dosage is one vitamin and one mineral capsule daily, with any meal

"With comfort and care, we will take you there"

VEGEX *vs.* IRON AND COPPER

Alone, With Dried Whole Milk

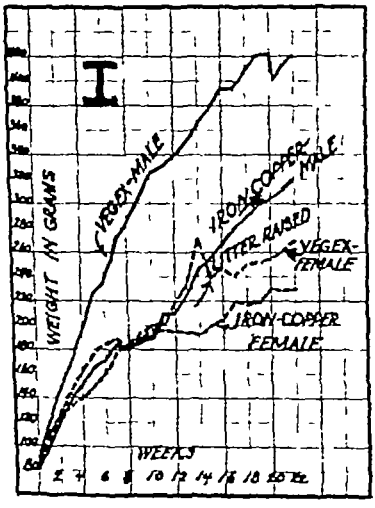

CHART I shows typical average animals on dried whole milk with Vegex and with iron and copper

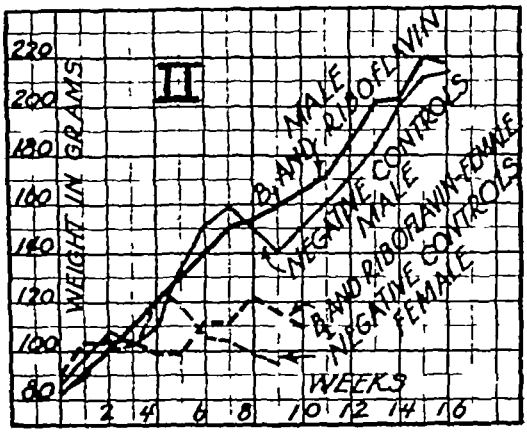
CHART II shows where B_1 and riboflavin were added and the negative controls In both cases many of the animals did not last the sixteen weeks test.

In previous Vegex advertising in the Journal of the American Medical Association, we gave growth and hemoglobin count results with test animals (Albino rats) using dried whole milk, (a) with Vegex, (b) with added copper and iron, (c) with added B_1 and riboflavin crystals and (d) controls



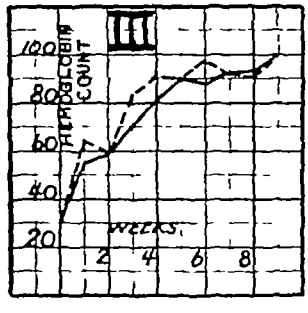


CHART III is a composite hemoglobin test of all the males and all the females in chart I The animals on Vegex had a hemoglobin count at the end of eight weeks of 96, with copper and iron 89, and the B_1 and riboflavin less than 10 These tests further show what milk needs for normal nutrition and that Vegex makes up milk s deficiency in some of the B vitamins and its deficiency in iron and the needed copper supplement.

One teaspoonful of Vegex supplies an average of 3 milligrams and three teaspoonfuls 9 milligrams of iron, together with the supplement of copper which seems adequate in the tests shown here A standard adult allowance for iron is about 12 milligrams daily Then Vegex supplies the extrinsic and intrinsic factors and is potent in all the known B vitamins

The Vitamin B Complex

The committee on nomenclature of the American Society of Biological Chemists in 1929, gave the designation G to what Dr Goldberger and his associates had termed the P-P (pellagra preventive) factor' Throughout the pellagra sections, 'G means this factor Riboflavin is devoid of it and should be separated from further designation as G

The entire B complex is needed to get the full results from any of the factors contained in it Vegex is high in the vitamin B complex. It is palatable and easily borne for use by the pediatrician or the adult patient

Samples for professional or clinical use will be sent on request.

DUDLEY SMITH

IMPROVED RECTAL SPECULUM

Designed by DUDLEY SMITH, M.D
San Francisco, Cal.

D193—Made in two sizes Large and Small Price $9 00 each Chrome Plated Sold thru dealers only

½ Size

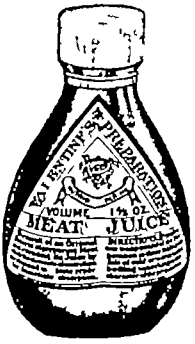
THE accompanying illustrations show a bivalve operating speculum which has the following advantages

1 The handles are short and do not impinge on the buttocks or the table

2 The distal ends of the blades, separate three-quarters of an inch farther than the proximal ends, which together with the comparatively flat surfaces of the blades enables the operator to secure a much wider exposure than with other bivalve specula

3 The patented LOKTITE permits the speculum to be adjusted to any degree of spread and releases quickly

½ Size



Visit our Booth No. 37, N Y Med. State Meeting Waldorf Astoria New York City May 9 to 12th

The instrument is made in smaller size for minor operative work in the office under local anaesthesia and will be found especially useful for excision of anal ulcer or the removal of a single internal external hemorrhoid

VEGEX *vs.* IRON AND COPPER

Alone, With Dried Whole Milk

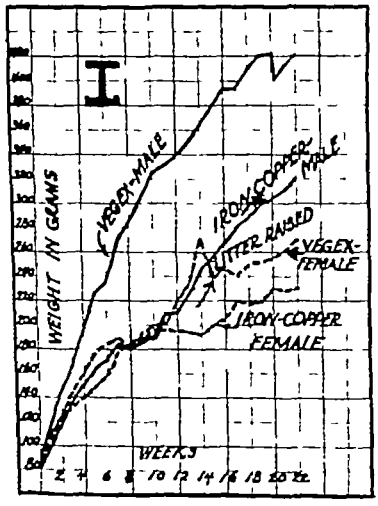

CHART I shows typical average animals on dried whole milk with Vegex and with iron and copper

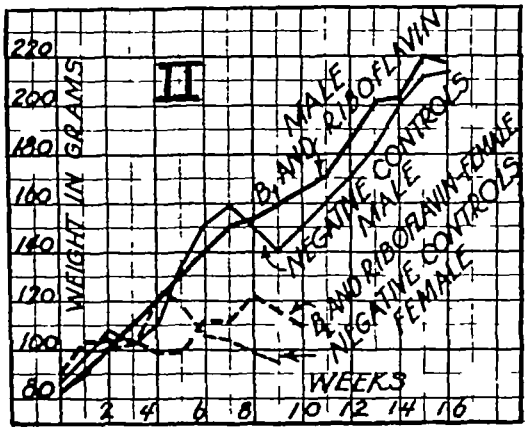
CHART II shows where B_1 and riboflavin were added and the negative controls In both cases many of the animals did not last the sixteen weeks test.

In previous Vegex advertising in the Journal of the American Medical Association, we gave growth and hemoglobin count results with test animals (Albino rats) using dried whole milk, (a) with Vegex, (b) with added copper and iron, (c) with added B_1 and riboflavin crystals and (d) controls



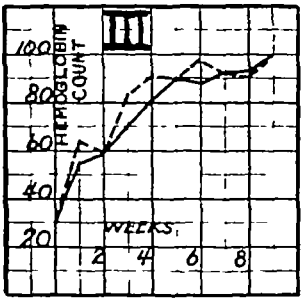


CHART III is a composite hemoglobin test of all the males and all the females in chart I The animals on Vegex had a hemoglobin count at the end of eight weeks of 96, with copper and iron 89, and the B_1 and riboflavin less than 10 These tests further show what milk needs for normal nutrition and that Vegex makes up milk s deficiency in some of the B vitamins and its deficiency in iron and the needed copper supplement

One teaspoonful of Vegex supplies an average of 3 milligrams and three teaspoonfuls 9 milligrams of iron, together with the supplement of copper which seems adequate in the tests shown here A standard adult allowance for iron is about 12 milligrams daily Then Vegex supplies the extrinsic and intrinsic factors and is potent in all the known B vitamins

The Vitamin B Complex

The committee on nomenclature of the American Society of Biological Chemists in 1929, gave the designation G to what Dr Goldberger and his associates had termed the P-P (pellagra preventive) factor Throughout the pellagra sections, G means this factor Riboflavin is devoid of it and should be separated from further designation as G

The entire B complex is needed to get the full results from any of the factors contained in it Vegex is high in the vitamin B complex It is palatable and easily borne for use by the pediatrician or the adult patient

Samples for professional or clinical use will be sent on request.

AN ANSWER TO . . .

"What may I eat, Doctor?"

"PERSONAL DIET SERVICE" supplies you with fac-simile TYPEWRITTEN DIETS complete and ready to give to your patients, with your name and address printed on each diet exactly as you wish These diets are up-to-the-minute, having been carefully selected by our supervising Medical Authority They are being used and Approved by physicians and hospitals all over the country

Our Service includes 21 of the following diets, Acute ulcer, cardiac, chronic gall bladder, pregnancy, reducing, hypertension, diabetic menus at three levels, and fourteen others

We prepare an outfit of 380 diet sheets on High Quality You pick any diets, any amounts of each to total 380

Complete price delivered is only $7 50—less than 2 cents a diet

MAIL COUPON FOR COMPLETE LIST AND SAMPLE DIETS TODAY!

FREE

With your initial Order you receive FREE a STEEL FILING CABINET indexed for each diet. A most simplified system for the diets

PERSONAL DIET SERVICE 141 W 45th St, New York City

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

II THE BLANCH

● Previously, we have described the rea sons for the thorough cleansing of raw food materials prior to canning and the methods by which such cleaning is effected Another basic operation in the commercial canning procedures for many vegetables and some fruits, is known as the "blanch" (1)

In essence, the blanch is an operation in which raw food material is immersed in warm or hot water, or exposed to live steam The blanch serves a multiple pur pose.

First, blanching serves to soften fibrous plant tissue By so doing, it contracts or expands these tissues and thus insures a proper final fill in the tin container Sec ond, during the blanch, respiratory gases contained in the plant cells are liberated This release of gas prevents strain on the can during heat processing and favors de velopment of a higher vacuum in the fin ished product

Third, the blanching operation inhibits enzymes naturally present in the raw foods and prevents further enzymatic action In hibition of enzymes — particularly those inducing oxidative reactions, yields prod ucts of superior quality and nutritive values Fourth, the blanch may serve as an added cleansing measure and also remove "raw" flavors from certain foods. A final function of the blanching operation is to fix or set the natural color of specific products

In commercial canning practice, blanching is usually accomplished in equipment es- pecially designed for certain types of prod ucts In general, the raw products after thorough washing are conveyed through water or steam by various mechanical de vices capable of adjustment so as to subject the raw materials to a particular tempera ture for the proper period of time.

Such, in broad detail, are the purposes and mechanics of the blanch, a basic operation in many commercial canning procedures.

Women Need No Longer Fear the Forties

ENDOCRINE THERAPY has advanced to the stage where women need no longer fear the mental and physical disturbances accompanying the menopause The problem of dosage is practically the only one confronting the physician who seeks to treat or correct the vasomotor symptoms

In most cases Amniotin effects prompt, satisfactory relief and permits the patient's return to the usual daily routine The most complete effect appears to be obtained when a sufficient amount of the hormone (10,000 units daily, intramuscularly) is administered to produce typical estrous changes in the vaginal smear. Many cases can be controlled by several capsules orally (3000 to 6000 units daily)

Amniotin—a Squibb preparation of the estrus-inducing ovarian follicular hormone—is highly purified It is available for hypodermic use in ampuls containing 2000, 10,000 and 20,000 International units and in the form of Pessaries and Capsules containing 1000 and 2000 International units

Amniotin has also been widely and successfully used in treating gonorrheal vaginitis in children

ALSO AVAILABLE

Follutein—Pregnancy urine extract for treatment of menorrhagia and of undescended testes, packages of 500, 1000 and 5000 units

Anterior Pituitary Extract—Contains growth, thyrotropic and gonadotropic factors Supplied in 20-cc vials containing 200 growth units

DERMATITIS DUE TO BISMUTH COMPOUNDS

Associated With Cutaneous Sensitivity to the Arsenobenzols —Report of Two Cases

JAMES W JORDON, M D and HAROLD L WALKER, M D, *Buffalo*

From the Dep't of Dermatology and Syphilology, Buffalo City Hospital and University of Buffalo Medical School

Since bismuth has assumed an important position in the treatment of syphilis, cutaneous eruptions due to sensitivity to its compounds have been reported from time to time The eruptions have been of a wide clinical variety Urticaria, toxic erythema, purpura, scarlatiniform eruptions, exfoliative dermatitis, morbilliform eruptions, pityriasis rosea-like eruptions, lichenoid eruptions, herpes zoster, and erythematous plaques have all been reported due to injections of bismuth compounds

A number of bismuth compounds have been incriminated as a cause of bismuth eruptions Galliot,[1] Vigne,[2] Hudelo et al,[3] Pinard and Marassi[4] have reported eruptions following the use of bismuth hydroxide Schamberg and Wright,[5] Mulot,[6] Skolnik and Aleshire[7] have reported eruptions following the use of salicylate of bismuth Hopkins,[8] McCafferty and MacGregor,[9] Grund,[10] Skolnik and Aleshire[7] described cases of dermatitis following bismuth tartrates Fouquet and Machtou,[11] Lepinay,[12] and Vigne[2] report eruptions following bismuth quinine preparations and Galliot[1] has seen an eruption following benzobismuth Since numerous compounds, containing a diversity of chemical substances held in combination with the bismuth, have produced dermatoses, it is impossible to attribute these eruptions to any one agent present in bismuth compounds

Both inorganic and organic arsenic, including the arsenobenzols, have been frequent causes of cutaneous complications Like the bismuth compounds, the arsenicals are capable of producing a wide variety of cutaneous eruptions

Various forms of intolerance to both arsenical and bismuth preparations have occasionally been described Galliot[1] reported two patients who had gastrointestinal reaction when an arsenical compound was given and urticaria when bismuth hydroxide was administered A third patient reported by him had nitritoid crises when arsenicals were given and localized dermatitis from benzobismuth Weissenbach and Basch[13] reported a patient with exfoliative dermatitis caused by arsphenamine who developed nausea and vomiting when a bismuth compound was given Schamberg and Wright[5] recorded the case of a man who developed a localized dermatitis from contact with neoarsphenamine and who, following sixteen injections of bismuth salicylate, developed urticaria, cyanosis, and shortly died Vigne[14] had a patient who

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

reacted to arsphenamine Following bismuth hydroxide, the patient developed generalized edema, urticaria, acetonuria and died Nicolas, Gate, and Lebeuf[15] report a patient who had a generalized scarlatiniform erythema from an arsenical preparation and subsequently a generalized lichenoid eruption developed when a bismuth preparation was given Lortat-Jacob[16] states he has seen an arsenical erythroderma followed by a bismuth erythroderma Fouquet and Machtou[11] reported two patients who had a dermatitis from an arsenical compound and a generalized eruption when quinobismuth was given Michel[17] reported a patient who developed a dermatitis from both neoarsphenamine and a bismuth compound Tzank and Sidi[18] described the case of a man who developed a generalized erythroderma from arsphenamine, a bismuth compound, and a mercury compound Schoch[19] described two patients who had an arsenical dermatitis Upon subsequent treatment with potassium bismuth tartrate, one patient developed a generalized pruritus and the other a mild dermatitis He believed his cases due to the use of a syringe contaminated with arsenic

It is apparent from previous reports in the literature that intolerance of various types to both arsenical and bismuth compounds is occasionally encountered and in isolated instances may manifest itself by severe cutaneous sensitivity to both compounds We wish to report our observations on two such cases

Case 1 L V, an Italian male, age forty-two, first presented himself to the outpatient clinic of the Buffalo General Hospital in January 1931 A routine Wassermann and Kahn test done at that time were strongly positive He gave a history of having had a chancre eighteen years before for which he received sixteen intramuscular injections of an unknown drug There were no physical findings suggestive of syphilis A diagnosis of latent syphilis was made and treatment recommended The patient went to his private physician who gave him combined arsphenamine and bismuth treatment. This was well-tolerated for the first five treatments Following the sixth treatment the patient again presented himself at the hospital, this time with a severe generalized papulovesicular exfoliative dermatitis, which was diagnosed as an arsphenamine exfoliative dermatitis The dermatitis subsided at the end of six weeks Six months later he was given one intramuscular injection of camphobismol (1 Gm) The next day the patient developed a generalized dermatitis and two days later was admitted to the hospital At this time, he presented a generalized papulovesicular exfoliative dermatitis. This lasted approximately four weeks Following recovery, patch tests were applied with camphobismol (5%), neoarsphenamine (33⅓%), and bismuth salicylate (10%) The patch test with neoarsphenamine was strongly positive (marked vesiculation) The tests with bismuth salicylate and camphobismol were negative. Two weeks later treatment was again started with gradually increasing doses of camphobismol (025 to 1 Gm.) The patient received twelve such injections and no further dermatitis resulted He was later given fifteen intramuscular injections of bismuth salicylate of 12 Gm. each, without further incident. At a later date, the patient was again patch tested with 33⅓ per cent neoarsphenamine and the test was strongly positive. Desensitization to arsphenamine was attempted and he was first given 0002 Gm. of arsphenamine and one week later 0004 Gm No dermatitis resulted. The following week by error, the patient received 3 Gm of arsphenamine This was followed by a severe generalized exfoliative dermatitis which lasted approximately three months Three months later, intramuscular bismuth therapy was again started and the patient received five intramuscular injections of bismuth salicylate 12 Gm each Following the fifth injection, a vesicular dermatitis appeared on the hands and feet which gradually spread over the entire body The dermatitis assumed a chronic eczematoid form and did not subside for eight months

Case 2 J I, a Slavic male, age forty-four, first came to the outpatient clinic of the Buffalo City Hospital during March 1934 At this time he had a generalized, bilateral, symmetrical, discrete papulosquamous syphilis His Wassermann and Kahn tests were strongly positive He was given three intravenous injections of arsphenamine (4 Gm each) during the first week. Following the third injection, a generalized urticaria developed This subsided in a few days and treatment was resumed with 4 Gm. arsphenamine and 12 Gm bismuth salicylate weekly Following the third combined treatment, the patient developed a generalized papulovesicular exfoliative dermatitis lasting ten weeks Three months later, he was given an intramuscular injection of bismuth salicylate (12 Gm) The next day

an acute generalized vesicular dermatitis developed requiring three weeks to heal Following recovery, patch tests were applied with bismuth salicylate (10%) and neoarsphenamine (33⅓%) The patch test with the neoarsphenamine was strongly positive (vesicular) The test with bismuth salicylate was negative Two months later he was given an injection of neoarsphenamine (.025 Gm) and a mild generalized erythematous dermatitis developed

Comment

Sensitivity to arsenobenzols and bismuth compounds seems well-established in both our patients They had strongly positive patch tests to 33⅓ per cent arsphenamine, indicating some degree of cutaneous sensitivity to arsenical drugs Both patients developed their first attack of exfoliative dermatitis during combined treatment with an arsenical and a bismuth preparation The first patient developed a second severe generalized dermatitis when 3 Gm of arsphenamine was accidentally administered and no bismuth given On two other occasions, a generalized dermatitis developed when only bismuth was administered The capacity of the skin to react in an eczematous manner to injections of bismuth compounds in this patient showed a peculiar variation The first attack of dermatitis following bismuth came with the first injection of camphobismol, after recovery from an arsphenamine dermatitis A long period of cutaneous tolerance to bismuth compounds then developed This was later followed by a second dermatitis during bismuth salicylate therapy Abramowitz[20] found patients with phenolphthalein eruptions frequently exhibit a refractory period or negative phase of temporary desensitization during which the drug may be ingested with impunity In this connection, Sezary[21] states that patients with a bismuth dermatitis often become desensitized and that further administration of the drug does not produce a second dermatitis Fouquet and Machtou[11] observed a patient similar to ours who developed a generalized eruption following the third and twentieth injection of quinobismuth

The second patient developed an urticarial eruption following the third injection of arsphenamine, an exfoliative dermatitis when combined treatment with arsphenamine and bismuth was given, and exfoliative dermatitis when bismuth salicylate was given alone, and a mild generalized erythema when a small dose of neoarsphenamine was given alone

These two cases and the reports of other investigators make it evident that intolerance to arsphenamine as shown by gastrointestinal, nitritoid or cutaneous reactions may predispose to or be accompanied by untoward reactions to bismuth compounds This intolerance may be evidenced by gastrointestinal or cutaneous disturbances and in isolated instances if bismuth therapy is administered result in protracted illness or death

We believe that sensitization to arsphenamine was the primary condition in both our patients, although both patients were taking combined treatment when the first attack of dermatitis developed This belief is based on the relative rarity of bismuth dermatitis as compared with arsphenamine dermatitis and also the observations of Sezary[21] Moore and Keidel[22] report twenty-one cases of arsphenamine dermatitis in 47,000 injections, an incidence of about one in 2,400 injections Vigne[2] states that he saw nine cases of exfoliative dermatitis in 76,478 bismuth injections, an incidence of one in 8,479 injections Sezary[21] found exfoliative dermatitis almost twice as frequent when combined treatment with arsenicals and bismuth was given as when arsphenamine was given alone He found, however, that sixty-six per cent of the patients who received further arsenical treatment following a dermatitis developed a second dermatitis

When further bismuth therapy was given, only three per cent of these patients developed a second dermatitis He believes that in the later three per cent of the patients, the first dermatitis was due primarily to bismuth In our two patients, a second dermatitis was evoked by both bismuth and arsphenamine

Primary sensitization to an eczematizing agent is commonly followed by sensitivity to other chemically related substances and not uncommonly followed by true polyvalent sensitivity to many substances of diverse chemical structure This condition is not only seen in sensitivity to simple chemical substances but also with fungo toxins Stokes and Kulchar[23] have

pointed out that focal infection plays a part in predisposing the skin to an arsphenamine dermatitis White and Taub[24] believe sensitivity to fungo toxins exerts an important influence in the development of sensitization dermatoses of nonfungus nature We previously found that patients presenting a contact dermatitis due to various substances frequently exhibit sensitivity to soaps [25] Bloch[26] has found that thirty-five per cent of eczematous individuals react to more than one of ten common cutaneous irritants We have recently seen a patient who, during bismuth salicylate therapy for cardiovascular syphilis, developed an acute mycotic infection of the feet with a dermatophytid on the hands Bismuth salicylate was well-tolerated until the sensitivity to the fungo toxin developed Following recovery from the mycotic dermatitis a severe generalized exfoliative dermatitis developed when further treatment with bismuth salicylate was given Patch tests to bismuth salicylate were negative

Thus the event of one allergic phenomenon, such as an eczematoid dermatitis, whether due to substances taken internally such as arsphenamine, quinine, etc, or to substances contacted externally such as primrose, soaps, etc, frequently heralds a series of outbreaks due to substances either related or unrelated chemically

Therefore, following a severe dermatitis such as our patients exhibited, caution should be used in giving further treatment of any kind

The negative patch tests in our two cases of dermatitis following bismuth compounds demonstrate again that the patch test is of limited value in determining the causative agent in eczematoid eruptions except when due to external contact substances It is generally accepted that when an eruption is eczematoid in nature, the epidermal cells, and perhaps, the vessels in the upper corium are the sites of sensitization (Bloch,[27] Wise and Sulzberger,[28] Sezary and Mauric[29]) so that applications of the offending antigen from without (patch test) cause an eczematous response There are numerous reports in the literature demonstrating that this is frequently the case in eczematous drug eruptions due to such drugs as quinine,[30] formalin,[31] codeine,[31] and opium,[32] where the sensitizing substance has been taken internally and carried by the blood stream to the sensitized epidermal cells producing an eczematoid response in the skin from within and, when patch tests are applied, an eczematous response from without However, the applicability of the patch test in determining the cause of a dermatitis due to some substance taken internally, such as a drug, is limited by failure to test the skin to metabolites of the drug Lichtenstein[33] has found that in cases of exfoliative dermatitis due to gold compounds, patch tests with gold sodium thiosulphate gave positive responses (ability to ionize to monovalent gold ions in the skin), while patch tests to gold succinimide failed to give a response (inability to ionize)

In the case of an arsphenamine dermatitis, patch tests may be negative when cutaneous sensitivity exists [34] The patch test is further limited by the possibility of fluctuating cutaneous allergy and a negative allergic phase following the outbreak of a severe dermatitis It is probable that in certain cases of patch testing—negative arsphenamine dermatitis and bismuth dermatitis—the dermatitis is not caused by the intact arsphenamine or bismuth molecule but is due to split products of their metabolism Many bismuth compounds contain their molecular structure—salicylate, quinine, etc—drugs which commonly produce cutaneous sensitivity If it be true that arsphenamine and bismuth eruptions may be due to their metabolites and thus give a negative patch test of the whole compound, it is logical to expect the same phenomenon in related cutaneous eruptions where the offending substance is taken internally and carried by the blood stream to the integument

Summary

1 Two cases are reported of dermatitis due to both arsenobenzols and bismuth compounds

2 From these two cases and the reports of other authors, it is evident that sensitivity to arsenobenzols may predispose to or be accompanied by sensitivity to bismuth compounds

3 These two cases again suggest that the patch test is of limited value in es-

tablishing the cause of an eczematous dermatitis except when produced by external contact substances, since a negative allergic phase may exist following a severe dermatitis and since the dermatitis may be due to split metabolic products of the drug which were not used in patch testing

Discussion

DR PAUL GROSS, *New York City*—This paper, based on exceptionally careful observation and thorough work up, brings out several important facts First, it sheds some light on what might be termed chronic arsphenamine dermatitis Although there are still a number of things to be clarified about the mechanism of the combined arsphenamine and bismuth allergy, the observations of Drs Jordon and Walker will leave no doubt about its existence. Undoubtedly the authors are on the right track if they suggested that the interaction between the bismuth and the body cells results in the formation of the allergenic substance Similar thoughts have been expressed by R. L Mayer in reference to the substances belonging to the Chinon group

The second fact really demonstrated is the unique position that arsphenamine dermatitis occupies within the large group of dermatitis medicamentosa I mean to say, it is the only eczematoid dermatitis caused by a drug without known preceding sensitization from without to within I do not want to open the question of the role of the paravenous injection as a sensitizing factor Naturally, what is said about arsphenamine holds true for gold and other heavy metals which seem to have an especial affinity to the epidermal cells Other eczematous drug eruptions are spoken of and at least in my experience may be explained by the well-known phenomenon of sensitization from without to within, viz Quinine hair lotion, quinine by mouth, tincture of iodine dermatitis, K. I by mouth, and many other examples known from the literature I don't think the term "drug eruption" should be applied to these occurrences which clearly belong to the contact dermatitis group

To clarify further the position of arsphenamine dermatitis, it will be useful to make a clear distinction between the exfoliative erythrodermia resulting from chronic (or acute) arsenical poisoning and the erythematovesicular edematous dermatitis resulting from arsphenamine hypersensitivity The presenters have left no doubt in their description about the clinical picture of eczematoid dermatitis in their cases

It is only one step further to state that arsphenamine dermatitis not only presents the clinical but also the biologic characteristics of eczematoid dermatitis

In our particular subject it should, therefore, not be a surprise to find a multiple allergy so frequent and important a feature of allergic eczema Dr Kesten and I carried out animal experiments, dealing with multiple sensitization, several years ago at Columbia University Neoarsphenamine was one of the substances we used in a series of experiments, the results of which have not been published yet.

Of course, before we assume multiple

allergy, i e, sensitization to as different substances as arsenic and bismuth, we ought to exclude definitely the possibility of group reactions

After all, the benzol ring is present in both arsphenamine and salicylic acid Many commercial bismuth preparations contain compounds to diminish the pain of intramuscular injections These facts must be considered in the performance of patch tests

The negative tests which the authors obtained in the bismuth compounds used in their two cases may be compared to some of the negative patch tests in contact dermatitis

But it is more desirable and fruitful to use these findings as a starting point for further research, this may reveal other important factors in the production of arsphenamine dermatitis, to mention only the question of hepatic insufficiency, salt and water metabolism, etc

The authors should be congratulated for presenting such an excellent and most stimulating paper on a subject of great importance

---

THE PSYCHIATRIST'S RESPONSIBILITY TO THE CRIMINALLY INSANE AND TO SOCIETY

Foster Kennedy, M D, New York (*J A M A*, Feb 26, 1938), points out that there are three protagonists in law trials in which an alleged insane person is either in the box or at the bar the judge, the alleged insane person and the doctor

There is an unseen fourth the public, made articulate by the press Our forefathers fought for the recognition of individual rights Such marked individual consciousness for the respect of the rights of the individual has been won that the safety of the mass has been neglected Society, in short, in America has been failing to protect itself against rampant individualism, as expressed by the man of violence.

During the last year there were over eleven thousand homicides in this country This represents a fifth of the total loss of the American forces sustained through both natural causes and at the hands of the enemy in nineteen months of first-class modern warfare The police force and the law courts are tardy instruments in the apprehension of the perpetrators of the majority of these crimes, but when they have been apprehended the medical man is often made another brake on the slow wheel of justice, abetted by the sentimentality of the press by being asked to testify in and out of season to the lack of responsibility of the criminal Law is an instrument for the protection of society It is not a clinic.

The real point at issue in a trial in which the defense is a plea of insanity is not whether or not the mind was unsound but whether it was sufficiently unsound as to be unable to determine right from wrong, or the nature of the act If not, was the accused a victim of so uncurable an impulse to commit the crime as to ignore the ordinary social inhibitions and be forced thereby heedlessly to jeopardize his own safety? Irresistible impulse has a place in medicine. It is right that it should have a place in law But it is rare in medicine and still rarer in the courts

The whole system whereby a defendant employs and pays for *medical opinion* in the courts is wrong and should be abolished. The author can see no reason why a defendant should have any more constitutional right to pick his medical expert than he has to pick the policeman who arrests him or the judge who presides at his trial Acquittal on account of a *mental disease* or semimental disease is often a feeble release of wolves to prey on the people and should no longer be tolerated.

The following program is surely one for ardent hope 1 That in all cases of felony or misdemeanor punishable by prison sentence, the question of responsibility be *not* submitted to the jury, the jury will thus be called on to determine only *that the offense* was committed by the defendant 2 That the disposition and treatment (including punishment) be based on a study of the individual offender by properly qualified and impartial experts cooperating with the courts 3 That no maximal term be set to any sentence. 4 That no parole or *probation be granted* without suitable psychiatric examination 5 That in considering applications for pardons and commutation, careful attention be given to reports of qualified experts A sixth recommendation might be included in this program that there be chosen a panel of qualified *medical opinion*, if possible from university and major hospital staffs, who would advise the conscience of the court These physicians would receive adequate remuneration from no private individual or corporation but from the state, and only from the state

CURE OF HYDROCELE BY INJECTION

LOUIS H BARETZ, M D, F A C S, *Brooklyn*
Visiting Urologist, Jewish Hospital and Kings County Hospital

In the writer's original paper[15] published in 1935, the title used was "The Treatment of Hydrocoele By Injection" Several investigators thereafter reported a similar success by this method, and since many of the injected cases have been followed for four to five years, I feel today that the title "The Cure of Hydrocele By Injection" is beyond criticism

Skepticism for any new procedure is a natural and healthy characteristic of the experienced and well-informed physician and surgeon And so it should be New methods, new drugs, new procedures, operative or otherwise, have come and gone, with the production of a temporary flurry of enthusiasm, often followed by a keen disappointment, and then a resulting skepticism for any future new methods However, the increasing reports of glowing success in the hands of careful and reliable workers with this injection treatment, have taken this subject out of the experimental field and firmly established the treatment as a method of choice for hydrocele

Kilbourne and Murray[14] state "The treatment has avoided hospitalization It has avoided confinement to bed It has avoided surgical complications It has not kept the patient from work"

F W Solly [20] "The advantages of the injection method over the surgical are obvious Results are so uniformly satisfactory both to the patient and doctor that we believe this treatment will soon largely replace the surgical operation for hydrocele."

Ewell, Marquandt and Sargent [16] "After three years of experience in a goodly number of types of hydroceles, we feel that the injection method of treatment is safe and efficient in a great majority of cases In 75 cases, there were four recurrences"

M Mayer [21] "It is our opinion that the modern treatment of hydrocele by injection meets the requirement of decreased risk, lessened morbidity and increased economy"

Theory of Injection

If the entire endothelium of a hydrocele sac could be damaged, thus causing an outpouring of fibrin ferment, theoretically the fluid should clot and cause obliteration of the sac

The rational is the introduction of some fluid into the sac sufficiently irritating to produce an inflammatory reaction in the serous lining which will cause opposite walls to adhere Since endothelium is of mesodermal origin, the repair process following this reaction leads to the production of fibroblasts and ultimately to the occlusion of the sac by fibrous tissue

Ewell and his coworkers[16] believe that "the resulting fibrosis of the tunic wall following injection so interferes with the blood and lymph supply of the endothelium that in some way it alters the process of fluid formation or reabsorption"

History of Injection

The treatment of hydrocele by injection is not a novelty Iodine and phenol were used as far back as fifty years ago The method was sane and scientific, but the solutions used were far too irritating Many physicians in active practice today must recall their own experiences with phenol or iodine—the reactions, the pain and sloughing which resulted There naturally followed a period of modification of the irritant used—glycerin and alcohol, forty per cent alcohol, alcohol and phenol, port wine, milk, NaCl solution (1-8 inc.) * All of these gave questionable

The writer is grateful to the staffs of the Jewish Hospital of Brooklyn and also the Kings County Hospital for their kindly cooperation.

*A detailed account of the history of these injection methods was reported by the writer in a previous article.[15]

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

results with severe pain, reaction, and frequent recurrences so that the return to surgery was a matter of course

Operative Treatment

The surgical treatment for hydrocele has been quite successful Yet one must consider the economic problem with hospitalization, the possibility of mortality with any surgical procedure, the unavoidable morbidity, and the complications that frequently ensue Most of us who have come in contact with postoperative hydroceles have heard the patient woefully say, "Doctor, this is two months after my operation and I still have a large swelling" The hydrocele has been cured but a chronic epididymitis and thickened tunica have remained

As quoted by Ewell et al [16] "Sanford reported 5% recurrences following the radical operation for hydrocele Barney in a collected series of 412 operated cases reported 22 relapses (5 33%)"

Campbell [1] in 1927 reviewed 502 cases of hydrocele operated upon He reported a mortality of two cases due to pneumonia There was infection either superficial or deep in fifteen per cent of the cases The average stay in the hospital was 9 2 days There was occasional recurrence of hydrocele Complications were infection, hemorrhage, and involvement of the testis

Any method of treatment which will avoid hospitalization and the above complications will naturally prove to be a method of choice

New Injection Solutions

With the success of the use of sclerosing solutions in varicose veins, investigators were encouraged to attempt a modified injection method for hydrocele

The ideal solution would (1) Avoid pain, (2) Prevent reaction, sloughing or infection, (3) Not incapacitate the patient, so that the treatment may be an office procedure, and (4) Produce certainty of results

In 1928 Pybus[9] of England used quinine and urethane in two cases with satisfactory results

In 1929 Sharma[10] of India used quinine without reaccumulation of fluid

In 1931 Porrit[11] of England, and in 1934 Floyd and Pittman[12] of this country used sodium morrhuate with good results

In 1935 the writer[15] reported forty-one cases injected with quinine and urethane with equal success

Since then Ewell, Marquandt and Sargent,[16] Kemble,[17] Keitzer, Krug, Blavier[18] of France, Duray[19] of Belgium and Morton[21] have reported their results with similar enthusiasm Most of these used quinine and urethane

The writer has found the quinine and urethane solution (13 3% quinine) most satisfactory in his series

Technic

Since the onset of studies with hydrocele in 1932, the writer has had increasingly better results, because of what appears to be improved or modified technic

Success depends upon two factors

1 The sac must be completely emptied, thus assuring a concentrated injecting medium, undiluted by hydrocele fluid, the medium will thus come in actual contact with the endothelial walls of the sac

2 Sufficient fluid must be injected to thoroughly bathe the entire sac lining

The following technic was employed in the series of fifty-nine cases herein reported

1 The patient lies in a supine position

2 Use similar technic as tapping a hydrocele A small area of scrotum is anesthetized with novocain and a small trochar is used to aspirate the hydrocele fluid

3 The trochar is fixed in position to the scrotum with a Kelly clamp, thus insuring the fixation of the instrument so that its tip is always within the sac (*Fig 1*)

4 Empty the sac completely If uncertain, irrigate the sac until the return flow is colorless

5 Palpate the testis and epididymis for pathology

6 Inject slowly the solution of quinine hydrochloride with urethane (13 3%) using larger quantities with the larger sacs An ordinary intravenous needle #18 gage fits snugly within the trochar, and its point does not come in contact with the sac, thus preventing trauma

7 Withdraw needle and trochar and gently massage

8 Cover site with collodion

9 No suspensory or support is necessary unless patient is actively engaged in work

10 Patient may proceed with usual duties unless these are unusually vigorous

11 Patient returns in one week for observation

12 Do not retap an apparent recurrence at this time This is reactionary fluid and need not be disturbed unless the scrotum is tense.

13 If the swelling does not gradually decrease within two to three weeks, a second tapping and injection is performed

sacs may be injected at the same sitting without harmful effects

Congenital hydrocele without hernia will frequently subside by simple tapping, but where unsuccessful, the injection treatment will give excellent results

This method may be safely applied also to spermatocele, cysts of the epididymis, hydrocele of the cord, and other similar closed sacs

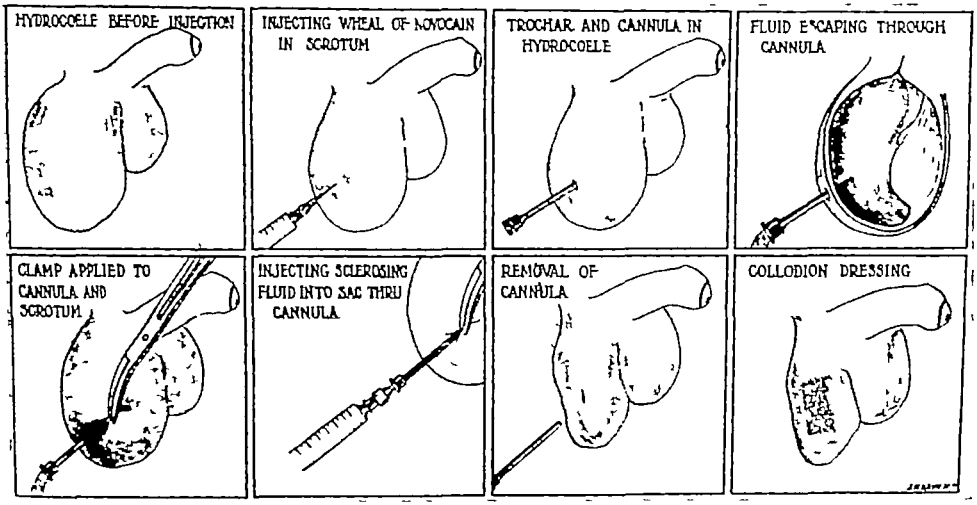

Fig 1 Steps in cure of hydrocele by the injection method.

Application

This method is applicable to the so-called essential or simple hydrocele which is the type commonly seen

Failure may be anticipated in the presence of certain contraindications to injection, viz

1 An associated congenital hernia The injected fluid would produce no ill effects but obviously would not eliminate the sac where there is direct communication with the abdominal cavity

2 Injury to epididymis or testis during tapping or production of a hematoma due to bleeding from a large scrotal vessel, should delay the injection for fear of inciting a marked infection (trauma plus irritant)

3 The pre-existence of an infectious epididymitis, tuberculosis or otherwise, a traumatic epididymitis, hematocele, neoplasm, etc

4 Old hydroceles with thick walls appear to react poorly to this treatment

Multilocular hydroceles Two or more

Quantity of Injection Fluid

The average hydrocele, containing a moderate amount of fluid, was injected with four c c of quinine hydrochloride with urethane The smaller sacs took a correspondingly smaller dose A large sac of 1000 c c received eight c c, and no further injection was required

Pain

Several patients complained of pain at the time of injection, which was usually dull and of short duration (½-3 minutes) The pain was localized to the scrotum or testis or radiated to the inner thigh or groin, or up toward the kidney One patient complained of epigastric distress

In some cases there was discomfort for one to two days

In no case was the pain an annoying factor, nor was the patient incapacitated and unable to continue with his daily routine

Reaction

Injection outside of the tunica produces no sloughing as is common with phenol

The usual reaction produces a swelling of three to six days duration with little or no pain This is a reactionary fluid and not a recurrence of the hydrocele As a rule the swelling gradually subsides

Where the scrotum is unusually tense, convalescence may be aided by a simple tapping

Reinjection

If the reactionary fluid above described be tapped within one week, it is found to be milky, and the sac may be reinjected However, I believe that if left alone, this fluid would be absorbed, and cause a complete obliteration of the sac If after two to three weeks fluid has recurred, a reinjection is advisable Success is usual with one to three injections, and success after one injection is not uncommon

Results

In the preliminary paper,[15] *q v*, the writer published in detail a series of cases with follow-up after observation from three months to three years.

To date 59 cases have been injected, of which forty-two have been completely followed Of these, twenty-nine (70%) gave perfect results The failures, for the most part, occurred at the beginning of the series, before satisfactory technic had been developed

The largest hydrocele was over 1,000 c c in a physican of seventy-eight years The smallest was in a spermatocele The average sac held about six oz

Summary

With increasingly larger numbers of cases successfully injected by others as well as the writer, it would appear that this is a rational method for a successful ambulatory cure of most cases of hydrocele.

Operation for hydrocele should eventually be entirely supplanted by this procedure because of (1) its simplicity (2) the absence of pain, harmful effects or invalidism (3) the apparently permanent cure (4) the avoidance of hospitalization and its concomitant economic loss (5) the elimination of surgery and its associated danger

Discussion

Dr. A L Parlow, *Rochester*—I would like to take this opportunity of congratulating Dr Baretz on the thoroughness with which he has presented the subject of the cure of hydrocele by injection and on the excellent clinical results he has obtained In a previously published paper on this subject he gave a most interesting historical summary

Most of us recall the unhappy experiences that followed the injection of hydrocele with iodine and phenol, which solutions became popular and unpopular during the early twenties With the success attendant with the injection treatment of varicose veins, herniae, etc, it was only natural that the investigator would again search for a solution to be used in the treatment of hydrocele Various solutions have been used including sodium morrhuate, and quinine and urea hydrochlorate However, the most ideal solution was described in 1932 by Kilbourne and Murray These investigators found that quinine hydrochloride (13 33%) and urethane (6 66%) met the desired requirements Since then Baretz, Mayers, and other workers have reported similar opinions

In the Department of Urology at the Strong Memorial Hospital (Rochester), we have treated a series of cases of hydrocele by the injection of sclerosing solutions and have obtained results that compare with those described by Dr Baretz We agree that the treatment of hydrocele by injection is a most valued addition but are of the opinion that the injection treatment will not entirely supplant the operative treatment We base this conclusion on the fact that we have had an occasional case who, having failed to obtain a cure of hydrocele in a reasonable period of time following injection of a sclerosing solution, demanded operative relief We do consider that it is most essential that the diagnosis of hydrocele be definitely established before the injection of the sclerosing solution. Our experience with the injection treatment of spermatocele has been most unsatisfactory The injection of the spermatocele sac has been followed by an inflammatory reaction with marked accompanying pain and elevation of temperature lasting for several days In addition to these symptoms, one case developed a postinjection epididymitis although the epididymis was not injured at the time of the injection. It is our present belief that excision is still the method of choice in the cure of spermatocele

In conclusion, let me say that I agree with Dr Baretz when he states that the cure of hydrocele by injection is an excellent procedure, that the results are apparently permanent, and that the economic saving is of tremendous advantage to the patient. Nevertheless, it is my present opinion that cure of hydrocele by injection has certain disadvantages and, therefore, cannot as yet entirely replace the operative treatment

TAX DEDUCTION FOR MEDICAL EXPENSES?

On a theory that a man's family is of as much importance as a man's cow, Senator Bone has introduced a bill in the United States Senate which would permit an income taxpayer to deduct from his taxable income the medical and dental expenses incurred by himself and family, according to a report in the *New York Times* At present, if a taxpayer's cow is injured or is taken ill, veterinary charges may be deducted, or if the cow dies, its value is allowed as a deduction, under existing law Senator Bone's proposal would provide for deductions up to $250 per year for medical, dental, hospital and nursing bills actually paid, and a further deduction of not more than $100 for funeral expenses incurred would be permitted. The bill also would allow money spent for the education of a taxpayer's children in grade and high schools, up to $250 per year, to be deducted from taxable income

Senator Bone said that President Roosevelt has "expressed his sympathy with the general purposes of the bill" The Senator pointed out that in view of the proposal sponsored by Senator La Follette to broaden the base of income taxation to include smaller incomes not taxed under the present laws, "it seems only fair to provide this very legitimate reduction for vitally necessary family expenses in order to protect those smaller incomes" The bill was introduced on the closing day of the last session of Congress, and held over in the portfolio of the Committee on Finance for consideration at the new session—*Westchester Medical Bulletin*

MORE RADIUM NEEDED

More than double their present supply of radium is needed for treatment of cancer by leading United States hospitals in the East and Middle West, according to hospital authorities interviewed in a regional survey

The survey, which covered leading hospitals and medical institutions from New York City to Minneapolis and St. Louis, is being conducted by the Eldorado Radium Corporation.

Approximately eighty-two grams of radium are now held by the 213 hospitals in forty-seven cities surveyed About 109 more grams are needed to meet treatment demands, authorities of these hospitals estimated With radium now priced at about $25,000 a gram, the present holdings of these hospitals have a market value of approximately $2,050,000 The additional supply which hospital authorities estimate is needed would cost at present prices about $2,725,000 Fewer than 100 of the hospitals owned any radium at all

TUBERCULOSIS CASE FINDING AMONG CHILDREN

The Importance of Certain Age Groups

WILLIAM J RYAN, M D, F A C P, *Pomona*
Medical Director, Summit Park Sanatorium

The work of tuberculin-testing and x-raying of school groups has now progressed sufficiently, it would seem, for us to begin to establish a fair evaluation of its significance in this all important problem of the control of tuberculosis There are some who would consider it as having but a small place in the tuberculosis control program, while others, it would appear, are concentrating the major efforts of this epidemiological problem to the school student and the young child

We may first assume that there is no other test in medicine which is more specific than the tuberculin test

Now, what is the significance of the results of tuberculin testing in a given community?

1 It is reasonable to assume that the incidence of positive reactors to tuberculin among the young is the best criterion as to the amount of infection in a given community

2 If this be true, there is considerable evidence to indicate that there has been a rapid diminution of the incidence of infection during the past ten years Myers, Douglas, and ourselves, as well as many others, have demonstrated this fact

In our investigation, the students of two high schools in Rockland County with a student population of approximately 700 each were tuberculin tested in 1931 and again in 1935 While the age groups, the amount and source of the tuberculin given were constant, from 1931 to 1935 the percentage of positive reactors was reduced by one-half—namely from about fifty per cent to a little over twenty-five per cent This rapid reduction in the incidence of tuberculosis infection in the young as reported by so many observers is, in our mind, difficult to entirely explain, for example, in our particular communities, no unusual program had been carried out to uncover and isolate disseminators of tubercle bacilli during those four years, in which there was such a tremendous reduction in the incidence of infection

On the other hand, it would appear, at least in many communities, that the number of recorded tuberculosis cases is constantly on the increase, perhaps not due to an increasing morbidity but rather to a more intensive case-finding program

Isolation of carriers of bacilli by hospitalization, in addition to the increased use of ambulatory artificial pneumothorax treatment, which changes many patients from open to closed cases, has been no doubt a factor in the prevention of spreading bacilli to their human associates Again, the improved technic of milk pasteurization and more complete eradication of bovine infection by tuberculin-testing may be additional factors in the reduction of the amount of infection

As to the wholesale tuberculin-testing and x-raying of the public school children, we will first present briefly the results of our study in Rockland County

The work was instituted in the Spring of 1931, selecting the seventh and eighth grades and all the four year high school students

Procedure

5 Mg of old tuberculin was administered by the Mantoux method To January 1937, 10,033 pupils or eighty-five per cent of the total school population gave consent and received the tuberculin test Of this number, 4544 or forty-five per cent were positive to tuberculin, all of whom were x-rayed with portable equipment on celluloid films All students with questionable x-ray shadows in their films were re-x-rayed at the sanatorium with high-powered equipment

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

Results

Of the 10,033 pupils examined, there were found

Manifest disease	102 or 1.0%
Childhood type healed	479 or 4.8%
Observation	455 or 4.5%

From these figures, it would seem that one per cent of over 10,000 children was a large percentage to find with active disease This number, we now believe, was indeed far too high, subsequent re-examinations placed a great many of those cases in either the observation or apparently healed group In fact, of the entire number, a recent review covering the period from one to seven years reveals the fact that but ten (one-tenth of 1%) were in need of any kind of treatment It is interesting to note that no deaths from tuberculosis have occurred in this group of students since the survey was begun

One hundred and six parents of the children whose x-rays revealed massive infection were also x-rayed—forty-four fathers and sixty-two mothers But two active cases were discovered, not a very productive finding, although a total of thirty-eight films showed the presence of some abnormal shadows, the majority of whom were classified as minimal arrested or the healed childhood type of tuberculosis and of but little clinical significance It was, however, quite possible that some were the original disseminators of the tubercle bacilli

In addition, there were x-rayed 609 members of the faculty, most of whom were classroom teachers, five active and seventeen arrested cases were uncovered

In comparison, we now wish to briefly present the results of 1,091 definitely known contact cases who were examined during the past five years There were none included in this group who were referred by physicians, on account of having or being suspected of having tuberculosis They were merely those apparently well who were urged to report for examination because of having been at sometime exposed to an open case of tuberculosis

The following were the findings

Far advanced		7
Moderately advanced		15
Minimal		82
Childhood and arrested adult type		35
Negative		952
Cases with positive findings	(13%)	139

It is, therefore, obvious how important it is to thoroughly examine the contacts before attempting to explore new and less fruitful fields

Summary

The methods which have been used in the past to detect early tuberculosis have proven far from satisfactory This is evidenced by the fact that eighty per cent of the sanatoria beds in this country are occupied by patients who are either in the moderately or far advanced stage of the disease

Further education of the public, as well as of the medical profession, in the symptoms and signs of the disease has failed to accomplish the desired results, and the reasons are obvious to those of us who are engaged in the clinical side of tuberculosis, namely that early tuberculous lesions frequently cause none of the more common symptoms such as cough, loss of weight, fever, hemoptysis, and malaise It is, therefore, apparent that some other course must be pursued

It is our belief that with the present status of the tuberculosis problem confronting us, a very large percentage of the general population will eventually be x-rayed or fluoroscoped for the detection of tuberculosis With the increased use of the Roentgen ray by the general practitioner in his office, the time is not remote when he will play the important part in the diagnosis of this disease, but he needs special instruction in the radiographic interpretation of the chest

While we have been skeptical in the value of fluoroscopy as a means of detecting early pulmonary pathology, and are still without experience, it would appear from numerous reports that in skilled hands x-ray screening is proving of great value and is being convicted of but three to four per cent error

The progress made in the examination of high school and college students together with the further investigation of their homes for the source of infection is indeed commendable, but we are of

the opinion that this procedure of itself is entirely inadequate to make an appreciable "dent" in the tuberculosis morbidity and mortality

We are in favor of continuing this investigation where funds and personnel are available, the educational value to the public alone would warrant it, but some other new methods must be pursued

It is generally understood that concerted activity should be directed toward the known-contact group, since continued investigation at this source will bear the greatest fruits for the amount of effort and money expended

It has been laid down as an axiom by Danish tuberculosis specialists that until the possibilities of all contact cases have been exhausted, a community or school survey must be regarded as an expensive luxury

Our next step should be to concentrate our efforts on those engaged in industry, particularly special groups of young women, as well as those of the male population who mainly come in the age-group of relatively high morbidity and mortality The time is ripe when we should investigate this field more intensely

It would, therefore, appear that wholesale diagnosis of early pulmonary tuberculosis hinges, at the present, on radiological examination of the lungs of as many persons as possible, the apparently well included.

While it may be impractical, I am inclined to agree with the British tuberculosis medical officer whose assistant erred and radiographed an apparently well person The young assistant expected to be severely censored by his superior, but instead the reply of the physician was "Young man, you have no cause for regret, we have just proved that another Englishman is free from tuberculosis"

AMERICAN ASSOCIATION FOR THE STUDY OF GOITER

The American Association for the Study of Goiter, pursuant to its accepted invitation and to correspondence with the Honorary Presidents and Attending Members of the First and Second International Goiter Conferences, announces that the Third International Goiter Conference is to convene in Washington, D C, September 12 to 14

The subjects proposed for discussion are as indicated in the accompanying tentative program

Physicians and others in the United States and in other countries desirous of participating in the Program are requested to submit titles at their earliest convenience Since the time which it is possible to allocate on the program is obviously limited, it will be necessary for the Program Committee to exercise its best judgment in the selection of speakers and to insist without exception that the speakers conform to the time allocated to them.

Manuscripts of addresses, papers, and discussions delivered or read at the meetings are to be published in extenso in the form of transactions

The official language of the Conference shall be English Interpreters will be furnished for papers read in other languages

For further information concerning the Conference, communicate with the officers of The American Association for the Study of Goiter or the Chairman of the Program Committee, Allen Graham, M D, 2020 E. 90 St, Cleveland, Ohio

Organization in a Teaching Hospital

E A ROVENSTINE, M D, *New York City*

From the Division of Surgery, Department of Anesthesia, New York University College of Medicine and the Division of Anesthesia, Bellevue Hospital

The field of anesthesia is at the present disordered There is increasing uneasiness over its development. The principal underlying cause for this agitation is a more serious effort by surgeons to reduce surgical mortality and morbidity

Surgery has improved its technics until they have reached a high degree of refinement, asepsis has been well developed, pathology has advanced equally with surgery, and diagnosis is scientifically established with x-ray, laboratory, and other aids Notwithstanding this progress the anticipated results have not materialized The removal of diseased organs and tissues has not always insured a favorable result and surgery has come to direct its attention more and more toward functional derangement of the body as a whole This physiological conception has led to the adoption of every medium to protect the organism and aid in its natural defenses It has stimulated attempts to eliminate every factor that might mitigate against the patient's convalescence and recovery It has brought attention to anesthesia with the realization that surgical results are influenced by changes at operation, that delay in postoperative convalescence is often postanesthetic delay, and that postoperative mortality may often be due to anesthesia

A further cause for the restive state of anesthesia may be found in the recent rapid and phenomenal accomplishments attending the extension of surgical therapy to all regions of the body The brain, heart, lungs, the entire nervous system are now the objects of therapeutic adjustments by surgery The methods for anesthesia that seemed adequate when manipulations were practically restricted to extremities, the abdomen or superficial structures are definitely found inadequate for many of the modern operative procedures

The manifestations of this disturbance in anesthesia are constantly observed in the complexity of methods, the elaborate anesthetic appliances, and the continual procession of new drugs Orthodox inhalation technics are being replaced by spinal and regional anesthesia, by rectal and intravenous administration of a surprisingly large number of unrelated chemical preparations Ream after ream of printed pages in transactions, periodicals, and books keep up an endless supply of information on anesthesia, information which too frequently obscures the truth, distorts the facts, and adds to the confusion Undergraduate medical students, bewildered by the unsettled instruction or lack of instruction, are rarely enlightened Lack of interest by their preceptors often encourage them to neglect anesthesia Interns are intrigued with such exercises as tracheal intubation, various nerve blocks, with new drugs, and with impressive devices for inhalation anesthesia but are infrequently privileged to master the practical use of them

The present state of unrest is unmistakable evidence that anesthesia has failed to meet the demands imposed upon it by the progress of medicine and the rapid strides of surgery, a failure due to its insignificant status in the medical curriculum, to the attitude of surgery generally to the subject, and to the low standards of training in the science of anesthesia Contributing also to the misfortune is the present economic fear and uncertainty which not infrequently caused the profession and hospitals to be dominated by a motive of profit with the anesthetic service a necessary vehicle Add also to the neglect the fact that anesthesia has often been guided by those who have not the scientific background apposite to progress, or whose teaching never developed the bent of mind to investigate or

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

interpret, and others who quickly fell into the sad error of thinking their practices sufficient

The need in anesthesia—if it is to be brought in proper alignment with medical practice and other medical specialties, if it is to give surgery proper assistance—is appropriate organization in medical schools, in teaching institutions, and in hospitals The proper organization for anesthesia in hospitals is the more complex problem and it is with this phase that this discussion is concerned Hospitals vary within wide limits and a plan for conducting the anesthesia service will need be altered to meet the different conditions A plan for the hospital connected with a medical school may not be effective for the large or small hospital, the private or charity institutions, or the hospital devoted to special practices Any organization adapted for a teaching hospital will need be modified to conform to dissimilar conditions in other institutions

Recently there has been inaugurated a reorganization of the anesthesia service in Bellevue Hospital (New York City) This is a large municipal institution caring for indigent patients exclusively and coordinating undergraduate and postgraduate medical education The organization is not yet complete but the progress made has won the approval of the administrative departments, the medical and surgical staffs, as well as the intern, resident, and nursing staffs The convincing indorsement for any new departure in hospital practice, the improvement that has resulted in the care of patients, is not readily gauged by concrete measurements, but the statistical data now available are definitely encouraging They indicate the trend toward more economical care of patients, shorter hospitalization, and a decrease in morbidity and mortality Any department of anesthesia should be organized with a purpose of improving the care of patients and lightening the burden of care in other hospital services In a teaching institution it should also offer an opportunity to graduates in medicine to receive thorough instruction in anesthesia It must strive to advance the specialty through investigation It is with these ideals that the organization to be described was attempted

The anesthesia department in Bellevue is organized as a separate unit but with a definite appointment as an accessory to other specialties, not exclusively surgical but more particularly so The personnel consists of a director and twelve assistants together with an office staff The director has a medical school faculty appointment which is the source of sufficient income to permit exclusive attention to administration, teaching, investigation, and clinical practice within the hospital The assistants are graduates in medicine who have completed an approved internship and are devoting a minimum of two years to postgraduate study in the specialty of anesthesia. They are classified as residents in anesthesia and have hospital connections identical to those of the resident staff of other departments Appointment is regulated so that one-half the staff will have had at least one year of clinical experience Although two years has been determined the minimum period for training, certain residents who demonstrate teaching or administrative ability are retained beyond this time for additional instruction The resident staff are quartered in the hospital and receive a small cash remuneration together with maintenance Those with more than two years service in the department are designated as senior residents and are provided a more liberal salary

The principal assignment of the anesthetist is in the operating amphitheatres The administration of anesthesia is his exclusive duty There he is presented with clinical experience during practically all recognized surgical manipulations for patients representing a wide variety of types and possessing innumerable complications All methods for clinical anesthesia that have proven merit are utilized The clinical work of younger men on the staff is closely supervised by those with more experience The assignment as an adjunct to surgical therapy is not confined to the operating room but includes in addition, ward duties Preanesthetic consultation is attempted for each case. At these visits an evaluation of the anesthetic risk is completed, the anesthetic regime, including preoperative preparation and preanesthetic medication as well as the anesthetic agent and method, is agreed upon by the house surgeon and the anesthetist Unusual and more serious

cases are visited by the director and visiting surgeon to confirm decisions of the resident staff The drugs and methods for anesthesia are not dictated by the anesthetist nor by the surgeon but are selected after consultation There is a definite cooperative effort to better serve the patient by individualizing the anesthesia for each case after giving consideration to the condition of the patient, the surgical procedure anticipated, and the risks involved Postoperative visits to each patient by the anesthetist is an integral part of his assignment He may then offer assistance in postanesthetic diagnoses and treatment The latter function is considered of greatest importance It is not eclipsed by the actual administration of anesthetic drugs

The appointment as an accessory to the surgical specialties does not limit the anesthetist's activities to surgical wards and operating rooms The instruction and training in the prevention of asphyxial deaths, the anesthetist's knowledge of the pharmacological action of depressant drugs, and the physiological principles of resuscitation, makes his service of value in resuscitation practices The members of the anesthetic department actively assist other services and frequently direct emergency resuscitation practices throughout the hospital

With a knowledge of gases and the apparatus employed for their administration, the anesthetic personnel is qualified and does assist other departments in the technical administration of therapeutic gases Administration of oxygen, helium, carbon dioxide, etc., is supervised therapeutically by the service controlling the patient with indications for such therapy The technical application involving the use of gases compressed in cylinders and the mechanical devices as well as their dangers and limitations is familiar to the anesthetist and forms part of his routine operating room activities He is, therefore, equipped to lend assistance with these procedures wherever they are in progress

The department of anesthesia has established a clinic with a definite purpose of employing methods for interrupting nervous pathways for therapy and diagnoses This practice does not belong to anesthesia alone but the anesthetist by application and experience in regional anesthesia will develop ability and dexterity in injecting nervous tracts in different parts of the body Patients with intractable pain, various algias, vascular diseases, anginas, etc, are treated Records, reports, and the administrative duties are assigned to the anesthetic staff The manipulation is carried out by the members of the staff and those of other departments who are interested

The distribution and responsibility for proper maintenance of all anesthetic drugs and equipment is the responsibility of the department and a record of the use of these agents and appliances together with their costs is available It is of interest to note that the reorganization of this department has been effected without adding an additional financial burden to the hospital's resources It has never been presumed that the organization was considered with a view of decreasing expenditures nor that its existence was justified because it was more economical However, it is consistent with existing economic conditions and with proper teaching that economies be practiced and taught It was found possible to furnish this anesthesia service without increasing expenditure despite a larger staff, the acquisition of new apparatus, and the use of a wider variety and in some cases, more expensive agents This was accomplished without detracting from the primary aims, that is, better and safer anesthetic care for the patient and more convenient operating conditions for the surgeon

It is obligatory that the teaching program for the resident staff of such an organization include intensive training in all features of the modern practice of the specialty Graduates in medicine who have already completed an internship and are devoting two or more years to qualify as specialists deserve adequate instruction The attempts to fulfill this obligation on the part of the hospital and the director of the service include active supervision and direction of clinical work with demonstrations and discussions of clinical methods Provision for each member of the staff to study regional anesthesia by dissection of the cadaver under the combined direction of a surgeon and anesthetist is arranged The department con-

ducts its own conferences under the direction of the chief Weekly meetings are held to review cases, discuss complications, results, etc At intervals the staff meets to review current literature relating to the specialty, to review basic principles, and to receive didactic instruction from the director Leaders in some related phase of practice are frequently guest instructors at these colloquiums Clinical teaching to the intern and house staff on other services is made available by the older members of the department of anesthesia Undergraduate instruction and intern training with which this report is not concerned, is also organized

It is an expressed opinion that the function of a teaching organization is not alone the distribution of knowledge but the accumulation of new knowledge as well

This department includes clinical and laboratory investigation as an integral part of its assignment Arrangements are complete for collaboration with the various hospital laboratories and with the basic science departments of the medical school Each member of the staff is constantly engaged in an investigation in the clinic under close supervision and with adequate trained assistance In the laboratories, individuals from the staff are assigned to work with those more experienced in research, investigating problems that have anesthetic application Opportunities are frequently presented to the staff for participation in scientific programs within the hospital, or by local and other organizations Encouragement is given to activities in societies representing the specialty, to the preparation of reports with merit, and to efforts toward the advancement of anesthetic practices

477 First Ave.

EPSTEIN SPEAKS

Abraham Epstein, Executive Secretary of the American Association for Advancement of Social Legislation, New York City, and one of the foremost promoters of health insurance in the United States, was a speaker at a meeting of the Forum held in Topeka on November 30 says the *Journal of the Kansas Medical Society*

Mr Epstein's subject was the Social Security Act, which he criticized severely from the standpoint that it does not produce enough benefits, and that its financing is obtained from all persons instead of the well to do He stated frankly that his advice had not been accepted in the preparation of the Act, which he thought was to its material detriment. A sample of his talk is as follows "We have a poor machine, a poor driver, and we are going down hill"

During the discussion following his talk he was asked several questions concerning his attitude on health insurance. Among these questions were "If he believes that health insurance is economically sound, would he be willing to provide beneficiaries with cash payments whereupon they might secure their own service rather than medical service itself?" If, as he evidenced, he feels that the English system is superior to that of the United States, how does he account for the fact that morbidity and mortality in that country are less favorable?" "Assuming that the minimum cost of a health insurance plan in Kansas would be $40,000,000 per year, which is twice the general budget of the state, how does he propose to obtain financing?"

His answers to these questions were evasive.

The Salmon Committee on Psychiatry and Mental Hygiene invites the medical profession and their friends to the Sixth Series of Thomas William Salmon Memorial Lectures to be given by Dr David Kennedy Henderson, Physician Superintendent of the Royal Edinburgh Hospital for Mental Disorders, Scotland, on April 18, 19 and 20 at 8 30 P M at the New York Academy of Medicine

Dr Henderson will speak on Psychopathic States considered from the view of 1 Their place in Psychiatry, 2 Their characteristics as evidenced by aggression, inadequacy, and creativeness, 3 Their understanding and synthesis

Dr Henderson is Professor of Psychiatry at the University of Edinburgh and is well-known as a consultant and lecturer He was a major in the World War and the author of several papers on the War Psychoses

TEACHING NEUROLOGY TO UNDERGRADUATE MEDICAL STUDENTS

LLOYD H ZIEGLER, A M , M D , *Albany*
Professor of Neurology and Psychiatry, Albany Medical College

Nervous tissue makes up slightly more than two per cent of the whole adult body It is somewhat heavier than the lungs and not as heavy as the liver Unlike these very vital structures that are relatively homogeneous and simple in function, the nervous system is complex chemically, morphologically, and functionally If the human body could be placed in a chemical that would dissolve all except nervous tissue, a phantom gossamer-like structure would result, retaining the shape of the body and its organs One could not look at such a web without suspecting that nervous tissue is a great receptive center, a greater coordinator than the vascular and lymph streams, and a great message carrier Because the front end of an animal meets with most stimuli, the accumulation of master tissue has been greatest in the head Such elemental stimuli as environmental temperature, light, tactile irritants, watery and gaseous solutions, gravity and noise, together with man's inner urges, and environment—all these have eventuated in the development of a nervous system, accretion upon accretion, which reveals the evolution of man in the same manner that fossils disclose knowledge of the geologic ages

Ranking third among the causes of death in the continental United States in 1935, vascular lesions of the brain alone amounted to slightly over eight per cent of all causes In large hospitals and clinics equipped to receive patients of all kinds, about ten per cent of the admissions are cared for on neurologic and psychiatric services Nearly forty per cent of patients regularly admitted to a psychiatric service, which does not select its clientele, have lesions of the nervous system which can be related to the breakdown of personality functions Such neurobiologic and clinical facts as these are only a few of many that indicate the need for special study of the nervous system in order to understand factors that sustain or interfere with one's integrity

Bearing in mind that medical colleges, on the whole, present basic training, leaving specialization to the graduate years, what should be the undergraduate experience in neurology consistent with these views? To attempt to answer this question presupposes some knowledge of the prospective student, of facilities for teaching, and some traditions relating to neurology

Students with presumably more than average zest for intellectual pursuits, but often with mediocre habits of study, enter the medical college with some knowledge of physics, chemistry, and biology Important as these academic acquisitions may be, especially biology, it should not be forgotten that the medium of communication between the prospective physician and his patient is language, which certainly has not been overstressed This may account for the avidity with which some physicians tend to pursue test-tube or other laboratory-test data before obtaining an adequate verbal report of the illness from the patient Furthermore, such a report usually presents very personal factors, the understanding of which requires a considerable knowledge of human nature, which is certainly no less important than the material studied in the laboratory

One needs but inquire of physicians who were graduated in the past few decades to learn that neuroanatomy too often meant the memory pursuit of a mass of long names associated with pictures in textbooks, rather than specimens, and that there had been little attempt to classify structure and function in terms of their likely everyday importance Under such conditions, the septum pellucidum was as important as the internal capsule, and both tended to disappear from memory at about the same rate Too often neuroanatomy and neurophy-

Chairman's Address at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

siology were taught as separate and distinct courses, when, in reality, they are inseparable, and should be given as far as possible in close association with pathologic and clinical demonstrations That nervous tissues require special methods of fixing and staining was often ignored Neurologic diseases were interpreted as incidental complications of internal medical or surgical diseases and implied a rather hopeless prognosis This tended, with exceptions among the more courageous and inquiring, to stultify interest in this important subject

Except in large centers, there were too few trained and interested workers in neurology to counteract the indifference and adverse traditions that permeated teaching staffs in general The courage of those who stood up against such insidious attitudes and insisted on the significance of the nervous system in health and disease is deserving of great esteem The autonomy of neurology is not sufficiently respected even to this day, which fact may be conclusively demonstrated by surveying conditions in almost any general teaching hospital

Ideally, it would seem to be wise to study man equipped with a nervous system, rather than a nervous system that dominates man How the nervous system came into being, the why of its shape and function, how it can fail of development or succumb, and what adjustments can be made to its congenital and acquired faults, suggest in a general way topics especially worthy of study A bird's-eye view is desired Thus psychobiology, neuroanatomy, neurophysiology, neuropathology, psychopathology, and clinical demonstrations, all correlated as closely as possible, would tend to give opportunity for the student to acquire the natural history concept of a great system in its relation to man's behavior

Psychobiology is the study of the living, acting, thinking, emotion-generating man The evolution of these functions deserves consideration and serves to make it clear that the nervous system plays an important, but not complete, part in the behavior of the whole [1] This should be introduced as a basic science, preferably in the first year of training

Neuroanatomy[2] and neurophysiology[3] —an inseparable unit of knowledge— should be presented by anatomists, physiologists, and clinicians to enable students to get divergent points of view Simple modelling of the brain stem in colored clays should serve to vivify important structures It is obvious that this slightly over two per cent of man's tissue needs to be studied with regard to how it cooperates with the muscles that help man to survive by locomotion and the coordinated use of the hands, how it receives stimuli by way of the sensory systems, how it mediates reflexes at various segmental levels, how it brings about cooperative action of muscles in defense against gravity, in fact, how vital it is to other forms of man's expression Hughlings Jackson pointed out long ago that if nervous tissue alone is stimulated, its function is increased, whereas, if it is destroyed, its function is deleted Lesions of the nervous system often affect function at points far removed from their site It has also been pointed out that those portions of the nervous system which work in opposition to each other are associated with signs requiring concepts of relativity not easy to evaluate, the pupil of the eye being an example In the neuropathological laboratory, by the study of brains, spinal cords, and nerves, the student may well be able to see the truth of Jackson's observations To become fascinated by gross and microscopic examples of infections, vascular and degenerative lesions, traumata, neoplasms, toxic insults, and anomalies, should not only enrich the previous study of anatomy and physiology, but should prepare the way for an understanding of those disturbances of personal function which are to be seen in the clinic. Much has been accomplished if students become thoroughly inoculated with the importance of the necropsy as a great and lifelong opportunity for learning

Psychopathology is the study of certain outstanding biogenic deviations in personal function that interfere with usefulness and comfort Perhaps neurologists in the past had become too mechanistic in their endeavors to explain much of human behavior in terms of lesions, this shifting of the responsibility of conduct to lesions was pleasing to those patients who found it difficult to assume such responsibilities themselves The stu-

dent of psychopathology learns that neuropathologic lesions may be causes, effects, or even be absent in serious disturbances of personal function, as the following examples demonstrate A patient with a broken leg may be rendered more unhappy by the restriction of his activity than by the local pain at the fracture site The physician that does not understand human nature can easily confuse one of these distresses with the other Catatonia may resemble Parkinsonism The elated patient, disregarding the ordinary rules of safety, may fracture his skull A pseudohemiplegia may resemble a syndrome produced by an intracranial vascular lesion A diplegic-like dysbasia may suggest the residuals of a myelitis The anorexia of a depressed patient may lead to pellagra with resultant brain damage Emotional disturbances may so affect respiration as to produce hyperventilation tetany More than one neurotic patient has had a brain tumor These examples, among many that might be given, make it imperative to embrace broad concepts of disorders of personality function A mere diagnostic label is less important than the accurate recording of symptoms and signs Objectivity of observation is essential

Clinical demonstrations should enable students to become familiar with those phenomena which require a special study of the nervous system Headache, syncope, convulsions, dizziness, tinnitus, pain, paresthesia, anesthesia, paralysis, muscle atrophy, incoordination, tremor, fibrillary muscle twitching, choreiform movements, athetosis, spasms, tics, visual disturbances, hearing and speech defects, dysphagia, disturbances of bladder, rectal, and sexual function—all of these require a facility of observation and examination which constitutes the difference between intelligent medical practice and guessing Students also should be responsible for observing as many of the above as possible, whether on medical, surgical, or neurologic services The sound-recording cinema should prove to be helpful in collecting and preserving the manifestations of disability, thus enriching the student's experience

To be able to know that disease of the nervous system is present, its location, and what the etiologic agent may be, implies accuracy of observation and use of instruments of precision into which medical students should be initiated In order not to be a hollow mystery or a stab in the dark, therapy should be based as far as possible on known etiology Students should see and follow the investigations leading to therapy, but should have relatively little responsibility in carrying out those procedures which belong to graduate training It is fundamental to expect them to know which diseases are best treated by surgical methods and which by drugs and physical therapy To treat a patient with well-defined multiple sclerosis for rheumatism and exhaust his financial resources, as has often been done, is not a mistake that the medical student with adequate training in neurology is likely to make

Too much detail has perhaps been expected of the very busy medical student, but when possible, some knowledge of historic facts should help to make clear our continuity with the past Richard Bright, known primarily for the disease which bears his name, gave to the world a century ago, drawings and descriptions of neurologic disease which should be an inspiration to any student What did Babinski, Kernig, Sydenham, or Parkinson say in original descriptions of signs or disorders designated by their names? Who discovered the usefulness of surgery for trigeminal neuralgia? Brain-cutting and clinical neuropathological conferences afford rare opportunities for enriching the student's experience about life and the nervous system, especially when clinical case material is not abundant At the end of four years of training a comprehensive oral examination, including a reasonable knowledge of all subjects taught, should prove helpful in welding the whole together into a workable unit of knowledge Emphasis on accuracy of observation and reasoning analysis is preferable to memorization of a mass of meaningless syndromes

The coordinating functions which the nervous system subserves magnify tremendously the importance of that small fraction of the body tissue, that gossamer web, those tentacles to the inner and outer environment This fact, together with the stimulating influences exerted by the rapid development of neurologic surgery,

the neurologic problems growing out of the World War and the epidemic of encephalitis, and the numerous maladaptations consequent upon increasingly complex living, have all conspired to emphasize the necessity for a greater study of the personal functions of man The teaching of neurology to undergraduate medical students resolves itself into the task of providing suitable opportunities for learning about life and how the nervous system relates to it To be able to observe accurately, read with focus and understanding, reason clearly, and describe facts rather than opinions or guesses, is more important than lecture halls, models, and much of the paraphernalia of teaching, valuable as these may be Only the known facts, great and simple, that have an everyday significance in the functions of man should be presented, leaving the less obvious to graduate training, or to the occasional person who desires to specialize Such fundamentals, thoroughly acquired out of a deep desire to understand human nature and human disability, should be invaluable assets in the long and arduous training that is demanded of a physician, no matter what his subsequent medical interests may be

NO SUNSHINE IN SOAP

During the past year certain brands of soap have been flamboyantly exploited for their vitamin D content, one for the "filtered sunshine" in its lather The latter product was introduced to the public with double page spreads in national magazines under the caption "The Dawn of a Great Beauty Discovery"

There is evidence that irradiated ergosterol may be absorbed through the skin of rats This evidence has been an excuse for adding vitamins to various cosmetic preparations

Redgrove points out that the real question at issue is not the ability of the skin to absorb these substances but "whether when so absorbed the vitamins exercise any beneficial action on the skin — in short, whether they are of any cosmetic value" Even if it is established that vitamin D exercises any beneficial action on the skin, says the *Journal* of the A.M A., it still must be proved that it has a beautifying effect.

As a matter of fact, there has been some recent evidence which indicates that the alleged beneficial effects mentioned by Redgrove as resulting from the use of cod liver oil in the promotion of healing of wounds and burns were probably due to some other factor than the vitamin D content of the oil It is not surprising that the Federal Trade Commission has recently published a complaint issued against a manufacturer who has made extraordinary claims about his product.

The advertiser who proclaimed the Dawn of a Great Beauty Discovery may soon be worrying about the twilight of the day when the sky was the limit for claims about "sunshine soaps"

A MEDICAL "INTELLIGENCE OFFICE"

For more than a year, the Ohio State Headquarters Office has been operating a service designed to assist young physicians in finding new locations and openings and to aid older physicians in their search for partners, assistants, etc. This "exchange" has proved quite useful to some physicians It has been a popular service and every effort has been made to make it a result-getter Data received are tabulated and through correspondence an effort is made to get parties seeking locations and those knowing of opportunities, together

This service can be of special value for physicians just starting practice, remarks the *Ohio State Medical Journal* On some occasions they are up against a mighty tough proposition in finding and selecting locations and need the assistance and co-operation of older men

Preventive Medicine

Every Day Prevention in Mental Health

B Liber, M D, Dr P H, *New York City*

Preventive medicine, in its general form or in its form of preventive mental medicine, is always modest, never spectacular Treatment, therapy, can say "I have improved or healed the sickness" or, if not, "I have done my best." Cure may proclaim loudly and sensationally "I have saved life, I have chased illness and brought back health" Credit is given them. But prevention can only claim to have avoided the trouble and indirectly the possible or probable catastrophe. It cures before disease occurs or establishes itself This cannot always be proved, but the expert knows He is convinced that what might have happened did not happen and his still voice tells him, "A stitch in time . " "An ounce of prevention "

Individual prevention in private practice is the same as public health on a huge scale, except that here statistics will show its value. Condemning the "lung blocks" in the slums, diminishing the working hours, improving the factories, educating the workers, has modestly, but definitely, prevented pulmonary tuberculosis The use of prophylactics has visibly reduced the amount of venereal infection in the Army and Navy

Foreseeing an epidemic and taking measures beforehand, even if the work remains hidden from the large public and unsung by the press, is better than fighting heroically afterwards

Prevention is like the man who never takes and therefore incessantly gives and not like the one who first takes all he can and then gives conspicuously, imposingly, in spurts of grand display, cashing in gratitude, praise, and glory

The intelligent physician of the remotest past mixed mental preventive ideas with all of his remedies And the real success, not the one measured in pecuniary terms only, of the modern, scientific, enthusiastic doctor depends largely on how much mental health teaching his instructions to the patient contain

The courage lavishly given to the sick, the smile in the proper time, the frown in the right place, the conditional promise the correct talk to the entire family—all this is mental hygiene, sown right and left, no matter what else is prescribed

To the cardiac patient—to take but a few examples at random—who claims that people with his ailment "drop dead in the street unexpectedly" the answer may be given that this is newspaper gossip and that there is no sudden death without some good reason unless it is due to an accident. This allays his *fear* and cures half of his condition Upon learning that, contrary to his own expectations, he will not be permanently nailed to the bed and will soon be up and about, provided he follows the advice given, he is much helped The humane doctor who speaks is regarded as a better physician than the one who is supercilious and mute and who just says, "Take this three times daily"

If you have only impressed upon your patient who, after a day's work, is spending most of his night playing cards, that *sleep* is extremely important, you have accomplished wonders He came because of general debility and pallor You have not cured him because you have found nothing to cure. But you have *taught him how to live* You have given him rest, time for a walk outdoors and therefore fresh air, a better appetite for his food You have improved his elimination and so have detoxicated him But what is more, you have put his fidgety nervous system at *rest* and, as if by magic, you have undoubtedly prevented some sort of *mental collapse*

You may not even always know the consequences of your preventive work. To have said to the middle-aged storekeeper to cut his day in two and lie down for an hour may not seem like much But it has steadied his afternoon, it has made him less grouchy and quarrelsome and has improved not only his business, but his *mental health* as well

You have condescended to explain to the woman that her blood pressure was not dangerously high, that it is something changeable, that what she had learned from hearsay was all wrong, that she must leave it to you to estimate the pressure in relation to all her functions She will be the *healthier* for that, both *physically and mentally* And you have gained a friend

A semi-neurotic is trying hard to convince you how sick he is, by disagreeably touching your shoulder, pointing to your chest and tracing his pain along your thigh Your careful physical examination discovers a real trouble By listening to him with divine patience you find out his

home difficulties Both are necessary investigations which cannot be ignored You are of immense help to him and you may have cured him of a *psychosis before it developed*

In another case the patient does not speak because he considers nobody as trustworthy You succeed in gaining his confidence and you accomplish what amounts to a miracle Where it was harder to extract a thought than to extract a tooth, you have done, as it were, *mental surgery* You have made the patient talk to you and you may be the only person who can keep him from *falling into mental disease*

You see a woman slightly inclined to *paranoia* She has "lost her voice" "Cara Nome used to be nothing to me," she laments And you succeed in convincing her about the value of her children, about *their* possible talents, about her share in promoting them You may have saved her *from incalculable trouble* before she had gone too far

A not overintelligent woman graduating fast into obesity is not only physically uncomfortable, but also mentally despaired about her appearance She has swallowed all possible medicines, is being massaged and is taking gymnastic courses However, she fails to do the one thing needful—to eat less She says "I'm trying hard to keep my old girlish shape" And you answer within yourself "You have more than succeeded, you have now a two-girl shape" She is quite *depressed*—which is not a paradox in many of these overweight persons You not only teach her how and how much to eat, how not to eat, but you also speak to her husband and uncover a situation which encourages *psychologically* this overeating Then you remove as much of the *mental cause* as possible and make her obey your instructions and you have prevented a good many harmful possibilities

You have attracted the parents' attention to their youngster's *twitch* of an eye or to his *nail-biting* and you have had with them an *intelligent talk* about the child's temperament, about the question of upbringing, about various habit-forming imitations, including anger and other spells and, finally, about *their own behavior* And you have tapped some good reservoirs that may have helped to *prevent much maladjustment*

A patient who is ordinarily and in all respects well-built is tortured by one obsession his penis is "too small or shrunk." Perhaps you can go to the bottom and find out *what forces him* deep down in his mind *to think that way* If not, if you can only persuade him *through any method* that he is wrong, he will get married and settle down and you will have saved an individual You may have to be stern and serious with him or superficial and humorous, according to circumstances In one case the following true anecdote broke the spell "My teacher of anatomy, when I was a student, once described the penis and in all earnestness said that in otherwise normal men this organ cannot be too small, but it does happen to be too large and then it is a distinct disadvantage and a bad handicap The largest that has been observed in the world is in London and *I have* the second largest—go up to our anatomical museum and you will see it"

Nor do we always deal with disease alone or with physical complaints only The irreligious and wealthy children of an old little widow wanted the doctor, himself far from pious, to tell their mother that Church work and collecting old clothes for the poor was not the correct thing for a lady of means who was not free from a quiescent chronic kidney ailment But it was evident that they, although providing for her financially, neglected her otherwise and that she had nothing else to live for and that, *for the sake of her mental state*, this *must absolutely be left to her* So the doctor, conspiring with this aged woman, helped her to a longer life and to continued *happiness*

And so on and so forth

IS THIS AGRICULTURE?

A bill to require certification of new drugs by the Secretary of Agriculture before they could be marketed for general use has been introduced in the House by Representative Chapman (D) of Kentucky, a member of the House Interstate Commerce Committee.

He said the measure was "designed to prevent premature introduction of new drugs that have not been adequately tested for their effect on human life

"If these requirements had been law six months ago, the lives of nearly 100 persons killed last fall by elixir sulfanilamide would have been saved," he said

EDITORIALS

Proceed with Caution

Recent events reinforce organized medicine's opposition to compulsory health insurance In Oklahoma widespread nepotism and graft in the administration of old age and unemployment insurance have already come to light Conflict between the Federal Government and the several states on the subject of administrative allowances threatens an administrative breakdown "just at the time when we are faced with handling the peak load of our unemployment insurance commitments," according to New York State Industrial Commissioner Elmer F Andrews The use of vast social security reserves for unrelated Federal expenses presages additional heavy taxation when insurance obligations start falling due in large volume

It was not to be expected that a vast program of social insurance could be instituted in a large and heterogeneous country like ours without a certain amount of blundering and corruption Let us assume that error and malfeasance have been kept at a minimum The storm signals coming from all parts of the country in connection with old age and unemployment insurance warn that this is no time to attempt compulsory sickness insurance, which presents even greater actuarial and administrative difficulties

There are indications that Washington intends to ride out the present recession without taking any new steps which might further disturb the nation's economic equilibrium The health insurance group in the Administration is still active and powerful, however, and it must not be assumed that delay means defeat of its aims

At the present time medical societies all over the country are busy with plans to provide adequate medical care for all sections of the public without the expense or other drawbacks of compulsory sickness insurance This is still another reason for keeping alive the fight against a bureaucratic system which is unduly costly and detrimental to the public health

The Chiropractic Bill

The 1938 chiropractic bill retains all of the objectionable features of its predecessors In its zeal to bring all current practitioners within the pale, it completely ignores the public health

The Peterson bill prescribes examination in the basic sciences for future candidates for chiropractic licensure—but it is not the same examination as physicians and osteopaths must take The examining board would be composed entirely of chiropractors—and it may safely be assumed that they would temper their

questions to the never very exacting standards of the chiropractic schools

Physicians and osteopaths are required to have two years of premedical college work before admission to their professional schools In practice, most medical schools require a college diploma The Peterson bill demands no more than high school training of chiropractic students

Meager as the educational provisions of the current chiropractic bill are, at least they acknowledge the necessity for certain minimal educational qualifications in those who undertake to treat the sick As far as present practitioners are concerned, however, educational requirements are brushed aside, regardless of the ensuing danger to the public health All those now practicing chiropractic in this state would be licensed without examination, even though they are devoid of the educational minimum fixed by the Peterson Act itself

During the present century, the State of New York has consistently elevated its standards for the practice of healing Adoption of the Peterson chiropractic bill would reverse this trend and destroy the educational guarantees with which the state protects the sick

Medical Expert Testimony

The intelligent layman who reads of a court trial in the public press is often confused at the report of the directly opposite medical testimony given by the alleged experts in court The unintelligent reader shrugs his shoulders and, with the prerogatives of mediocrity, assumes that you can buy opinion for either side provided the price is right

For a long time the medical profession has been exceedingly perturbed over the same problem and realized that something was radically wrong in the loss of prestige and respect on the part of the public, due to this seemingly contrary point of view of medical men alleged to be experts Neither the public, intelligent or unintelligent, realized that the conflict of opinion had deeper causes, and as often happens, the obvious answer that one could buy any opinion for a price was not the real factor at issue The real factor at issue as the medical men knew, which the public and the press did not know, was that the testimony was not given by experts in the majority of instances

The matter has come to a head, and in an editorial in the *New York Law Journal* of February 9, John Kirkland Clark, predicating his argument on the decision of the Court of Appeals—which accepted the principle that the qualifications of a doctor may be established by the organized medical profession in a Workmen's Compensation case—indicates that here is a precedent established by the court which could be used in setting up panels of experts whose qualifications have been established and confirmed by organized medicine The contents of this editorial are well worth study Mr Clark made an address along similar lines before the Medical Society of the County of New York a short time ago

While we are on the subject, it is not amiss to recall that conferences are proceeding between a group of lawyers representing the Bar Association and a special committee of the Medical Society of the County of New York The matter is being studied further with the aid of Mr Alexander Wilson and others, preliminary to the drafting of a bill to procure a change in the code of legal procedure in regard to expert medical testimony It would seem at this time desirable to improve the code of legal procedure in order to protect the persons at bar and to lessen the opportunity for any sort of chicanery Let a panel of experts be placed at the disposition of the presiding judge

Our purpose at this time is not to draw attention to a *fait accompli* in regard to expert medical witnesses, but to draw attention to the willingness of the legal profession to cooperate with organized medicine in getting rid of a situation which is obnoxious to the courts, to the bar, and also to the medical profession

Control of Diarrhea in the Newborn

From all available reports concerning the recent outbreaks of epidemic diarrhea in newborn infants, it seems fairly certain that the lack of definitely organized, coherent plans for medical and nursing care of the newborn is in a large measure responsible for their occurrence More attention is paid to the question of economy in the furnishing of maternal and newborn care and little consideration is given to the problem of efficiency and adequacy of service

From the reports of Rice, Best, Frant, and Abramson,[1] [2] it is evident that both morbidity and mortality from the disease is lowest in those lying-in hospitals where complete precautionary measures are instituted early Suspension of all service and complete isolation will suffice for the control of the epidemic once it has appeared This, however, while adequate for the control of the immediate outbreak, does not offer a satisfactory means of preventing the appearance of diarrhea in the newborn in a maternity service Nor is the application of the precautions used in nursing homes for older infants, wherein the resident population is stationary, a successful preventive against this disease

Based upon experience gleaned from its Bureau of Preventable Diseases, the Department of Health of New York City has added to the Sanitary Code certain mandatory regulations concerning the conduct of lying-in institutions and newborn nurseries The directions for the control of delivery room, nurseries, laundry, preparation of formulas, examination and conduct of the entire personnel, feeding technic, and the reception of visitors are all designed to reduce to a minimum the morbidity from epidemic diarrhea in the newborn Institutions which do not come under the control of the New York City Health Department would be wise in adopting regulations for maternity and newborn care based upon the recommendations of this body The continuous shifting of babies from the nursery to the mother's room for feeding, and then back again, makes it imperative that a technic of aseptic nursing be rigidly enforced, if the fullest prevention of this disease is to be achieved

Brachial Neuritis After Serum

The administration of heterologous serums for the prevention and treatment of many conditions is often followed by untoward reactions From the ordinary simple serum sickness to the more severe anaphylactic manifestations of inherited sensitivity, the use of immune serums often presents a serious problem in therapeutics It is extremely difficult to foretell which patient will react unfavorably, even though an attempted estimation can be made from the family and past history In most instances, the urgency for the use of serum overshadows in importance the possibility of subsequent aftereffects Nevertheless, some of the complications of serum therapy are of such import that a more careful preliminary investigation should be attempted before its use even in emergencies

Bubert[1] reports a frequent neurologic sequela to the injection of horse serum This assumes the form of excruciating pain distributed to the peripheral branches of the brachial and cervical plexi While in most instances the life of the patient is not endangered, a return to normal function may be delayed for several months During this time, there is untold suffering from the pain which may not yield to any form of medication This complication of serum therapy has been known but little stressed

All possible safeguards should be employed before the serum is injected The previous use of this form of medication, the skin and conjunctival tests, and the history of allergic manifestations in the

1 Bubert H M, *Bull Sch. Maryland Univer.*, 22 112, 1938

individual or his family must be given the utmost consideration The casual and indiscriminate use of the several antitoxins commonly employed should be discouraged Close supervision of undergraduate and hospital residents in the matter of serum therapy plus a full realization of the more serious complications which attend its use will go far toward eliminating disabling aftereffects

CURRENT COMMENT

"'GIVE OUR PEOPLE A CHANCE to work, and lessen the cost of government and our profession will care for the sick and our patients will take care of their doctors Let the government give what the administration cost of Federal controlled medicine would be to those who are sick and that would pay the physician and save the government the cost of medical service'"—One doctor's opinion, voiced in the March issue of the *Illinois Medical Journal*

States the *Journal* in comment, "But it wouldn't of course—and that is the hitch with the bureaucrats—pay salaries of any political henchmen who would have fat jobs by entering into the practice of medicine by virtue of political favor rather than by scientific attainment, as will happen when medicine comes under lay control of the ward healer Believe it or not, of such is the kingdom of state controlled medicine."

"WEBSTER GIVES AS HIS THIRD definition of medicine, 'a physician' I believe that if we go behind any science we will find that man is the science Behind chemistry is the chemist, behind physics is the physicist, behind medicine is the physician, the creator, the man The great scientist is a law unto himself He will be the same whether he be chemist, physicist, or physician To the average physician is given the privilege of beating a pathway to the door of a sick humanity, of carrying into the home alleviation of suffering and elimination of disease "—*Pittsburgh Medical Bulletin* of March 12

"ACCIDENTS DISABLE SIXTEEN PERSONS out of every 1,000 for a week or more annually and caused 7 per cent of all deaths in the nation, the United States Public Health Service announced today as the result of a health survey covering 740,000 families, made in 1935-1936

"The surveyors found that the accident rate among families on relief or earning less than $1,000 a year was 43 per cent higher than the level among families in the $3,000-and-over brackets This they attributed to poor housing facilities, such as inadequate lighting and heating equipment and rackety buildings and furniture. "—From *The New York Times* of March 13

" TO BORROW FROM MONTAIGNE, 'Man is certainly stark mad, he cannot make a worm, and yet will be making gods by the dozens' And Public Opinion is man made. It is being manufactured on a quantity basis to serve the ends of those who are only too impatient to avail themselves of the 'cohesive power of public plunder'

"American medicine is one of the most valuable of public assets, it has been solidly built and administered, on democratic principles It functions reasonably well as we within the profession know it, its ideal is quality But how is it viewed by those outside the profession? How does it look to the mind of Public Opinion, that mind compounded of prejudice, propaganda and politics, thinking in terms of mass production, man-hours and management, and deriving its information and inspiration increasingly from machines? Have we the courage to invoke this opinion? Can we look in this mirror unafraid? We cannot avoid it, it controls our destiny "—Common sense in an editorial to be found in the March *Westchester Medical Bulletin*

"MORE THAN NINETEEN BILLION dollars has been spent for relief in the course of five years by all government agencies It is not at all hard to agree with the chairman of the Central Statistical Board at Washington that we have got our money's worth in human and social good But, we do not like the grudging note which creeps into one sentence 'Health, and minimum standards of living have in some measure been sustained'

"Minimum living standards may have suffered, but why use the very serious qualifications 'in some measure' about the health of the American people during the depression it implies that the nation's health has suffered preceptively Yet the official death rate for the country by years from 1928 to 1935 has been as follows 12 1, 11 9, 10 9, 10 5, 10 7, 11, 10 9 In other words, all through the depression the death rate has been consistently lower than in the best years of prosperity The health of the nation has been maintained *far better* than 'in some measures'"—In the column "Topics of The Times" in *The New York Times* of March 17 (Italics ours)

Annual Reports

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1937-38

REPORT OF PRESIDENT

To the House of Delegates, Gentlemen

Our Executive year began in the latter part of a period of artificial national prosperity and promises to terminate during the second stage of a well-established financial depression All business and professional life has been affected Morale in many quarters has been weakened, benumbed, or doubtfully inert *Our* membership, accustomed to frequent discouragements in practice and, in spite of them, always striving for better results, have maintained a marvellous spirit of endeavor, accompanied by extravagant efforts in service and alert opposition to many schemes for destroying the essential relation of physician and patient Whatever doubts, fears, and errors have insinuated themselves here and there within our organization, we may well be proud of the maintenance of morale in our Society and in the loyalty of its members to the high principles enumerated in the first article of our Constitution

The Council, by provisions of the revised Constitution and By-Laws (1937), has assumed more extensive and inclusive duties comprising the combined authority and activities of the former Council and Executive Committee and the standing committees All of its members have served as chairmen of committees which have been actually subcommittees of the Council Thus the report of the Council will be more voluminous than in the past and will include all of the items previously reported by the Council, Executive Committee, and the standing committees and many of those heretofore included in the reports of the President and Secretary who are respectively Chairman and Scribe of the Council

It therefore remains for your President to present to you a resume of his own activities and his reflections upon what our Society has accomplished or failed to accomplish during the administrative year, and to offer whatever recommendations have evolved from his experiences

At all of the eight District Branch meetings we found loyal and most considerate welcomes, a splendid scientific program, and the most cordial fraternalism among members At each we presented a talk upon some specific phase of Preventive Medicine The text of these addresses has been published in the JOURNAL beginning with the issue of October 15, 1937 and continuing inclusively thereafter In preparing these papers we had valuable assistance from publications too numerous to mention and from personal suggestions from Drs William L Russell, Peter Irving, Foster Murray, Terry M Townsend, C Douglas Sawyer, Alec Thomson, and C Ward Crampton of our membership, Dr A B Glenn of the Second District Dental Society, and Mr Dwight Anderson, Director of our Bureau of Public Relations

Every District Branch meeting was well-attended The program, uniformly excellent, varied in type The First and Second Districts, with their scientific exhibits and departmental clinical programs stimulated the largest attendances in their histories The Fourth District meeting, held from Friday noon until Saturday noon, included a dinner with the ladies on Friday evening, at which, after a few brief speeches, an excellent entertainment was provided At the Seventh District meeting the Doctors of Dentistry in that District and the State Dental Society President joined in program and attendance—subject, "Medicodental Cooperation"

We have accepted every invitation to

visit County Societies except in two instances where the proposed dates conflicted with Society duties already arranged Thus we have officially attended meetings in Nassau, Rennsaelaer, Bronx, Monroe, Oswego, Onandaga, Broome, and Westchester and have spoken briefly or otherwise as the occasion demanded Some of these addresses have appeared in the JOURNAL All of these visits were thoroughly enjoyable and worth-while for not only are the splendid values of the work of county societies made clear to the administration but we are told that the members receive through these visits a feeling of closer relationship with the State Society and the activities of the Council and its committees

At the Broome County meeting we said "The Medical Society of the State of New York is thoroughly alive to the needs upon which are predicated an abounding future for medicine comparable in quality and distribution to other resultants of civilization and intelligent human endeavor"

Cordial relations of our Society with state officials and departments and mutual cooperation have demonstrated that the best health and welfare interests of New York State people are served by combined endeavors When we talked at the Saratoga Health Conference in June we asked aid for our program of Preventive Medicine The response has been hearty and helpful At this conference we suggested that a joint (Health Department and State Society) committee visit Detroit, Michigan to make a two-day survey of the Vaughan method of "Intensive Case Finding in Tuberculosis" (*J A M A*, September 4, 1937) Again cooperation! The Joint Committee's report included added visits to Oakland County and Battle Creek where very modern intensive health-methods exist showing increased interest in cooperation We remind our members of the combined efforts in Pneumonia Control and of the very essential part played by the Health Department, of the mutual endeavors in syphilis control, and of the placing of some of our eminent members upon the Cancer Commission now ready to report Altogether the concurrent alliance of State governmental forces and this Society in matters pertaining to health and welfare makes pleasant history of expanding accomplishment The alert accomplishments of the Council Committee on Contracts with Governments and State Departments deserve warm commendation

In what degree our program of Preventive Medicine will contribute to the future of medicine and social welfare depends upon our membership and how great an interest has been aroused Certainly we have had the unrestrained and cordial help of the officers and Council, the Journal Management Committee, the Secretary, the Public Relations Bureau, the District Branches at their meetings, and the County Societies visited We steadfastly believe that a thoroughgoing campaign along this line for a decade or so may provide answers to many questions which people and groups and governments are asking Moreover valuable time will be saved many people, also anatomical parts, functions, and lives An increase of interesting work for physicians will be a corollary accompanied by the abolition of many gruesome, exasperating (because hopeless) tasks We have called attention (N Y STATE JOUR MED, January 15, 1938) to the potential by-products of Periodic Health Examinations as sufficiently rewarding

Postgraduate Medical Education has been directed for the Society this year by the proven competent devoted beloved Tom Farmer Several effective local programs of Postgraduate Medical Education are conducted by component County Societies

The enthusiastic interest and practical value of the Woman's Auxiliaries have developed under accomplished leadership of earnest workers Always a believer, your President has a rapidly growing confidence in the need for them and their importance to organized medicine Women can exert certain influences where men would fail *Other* women will believe *them* while doubting the same statements from us In professional-social matters they are as ready to serve us as in domestic affairs They are alert and never delay action Recently called in emergency they acted without hesitation when rounded up by their state legislative chairman More than a thousand telegrams and letters were forwarded to important persons within forty-eight hours

We hope that in the coming year numbers of new auxiliaries will be organized Whatever the size of your county society or the accomplishment of its members a Woman's Auxiliary has amazing and helpful potentialities They need (and desire) direction and education in their duties To many of our members this would be gratifying and entertaining work.

We have addressed three coalition meetings of auxiliaries in three districts (Syracuse, Brooklyn, and Schenectady) Could all members have our experiences upon these occasions all counties would organize auxiliaries

Our House of Delegates at Rochester in May 1937 ordered the appointment of a Special Committee on Matters Pertaining to Medical Care in the State of New York Its duties specified are

(a) To establish a working definition of the term "Adequate Medical Care"

(b) To formulate principals and proposals for a State Health Policy

We have been fortunate in securing the faithful, enthusiastic services of an especially talented and well-informed committee under the leadership of Dr Walter W Mott of Westchester County with a membership fairly representative of all sections of the State Their meetings have been replete with impressive discussions in which every member has offered contributions of value Their report is a model of elucidating definition and well-reasoned suggestion Please read it and see that your delegates are prepared for discussion and action upon the floor of the House Out of this Committee's work amplified by the focussed wisdom of our fifteen thousand members represented in our deliberative body there may develop an example in State Health policy worthy of emulation by some sister states

Through the joint efforts of the Journal Management Committee, checked and instructed by the Council, and our extraordinarily energetic and competent publisher, our STATE JOURNAL OF MEDICINE has become one of the three best State Journals in this country Some of us think it *the best!* If maintained as now and with further enlargement and improvement, the JOURNAL will be a powerful influence for the good of our State and its neighbors in the future of medicine

Our most modern effective force for broad understanding of modern medicine and its spirit and aspirations is the Bureau of Public Relations Every other business and professional group and all organizations advocating social change are explaining their views to the public in a way to command attention So much misinformation about us is published that we need to take a modest and dignified position upon life's stage rather than wait in the wings for a cue that may never come So much general medical information is needed and desired by the general public that authoritative presentations carefully selected and judiciously phrased are clearly a part of our duty

Sound appreciation of medical values and extraordinary journalistic acumen and skill are outstanding qualities in the Director of our Bureau These are vitalized by unremitting activity and comprehensive consideration of all features of world-life that touch our membership He also has a clear understanding of how the layman and especially the critical layman will react to our pronouncements, and many of these have been shorn of their asperities by his blue pencil without losing vital force This very modest gentleman attributes a large measure of the Bureau's success to the earnest cooperation of the officers and committees under whom he has served The Council Committee of the current year has been the Chairman, Dr Guy Carpenter, Dr Terry M Townsend who was Chairman last year, and Dr Thurston Welton the Editor of the *American Journal of Surgery* The Council itself receives a report monthly and is in executive control of the Bureau's policies

The leading activities of the Bureau are

1 To keep our members informed of developments, political, social and economic which affect physicians or those in which we should be interested

2 To help us inform the public, in language they will understand, of those facts, features, advances, and conflicts of medicine which make for change—medicine being of supreme importance as an unhampered direct service to the people

3 To educate the public to understand

what the physician can do for them by informing them accurately, as occasion arises, concerning the preservation of health and the prevention and cure of disease For this purpose excerpts from scientific articles, from addresses upon quasi-scientific subjects, from health propaganda are carefully selected and under the authoritative announcement of an officer, the Council, a Committee, or the Society as a whole, forwarded to the daily or weekly press of the State as releases Sometimes such releases are mailed to outstanding lay citizens who are known to be especially interested in health problems

4 Another interesting development has been the forwarding to the County Societies of Speakers' Service Bulletins furnishing outlines of addresses suggested for local or regional use by County Society speakers In some of these a sample address is furnished for use in whole or in part in case of emergencies of time

Many of our leading members, leaders in other States, authors, newspaper executives, and publicists of note have approved of and complimented the work of this Bureau Their composite opinion expresses the thought that a better general understanding of medical men is thus furnished to the public and the profession and public are mutually served As presently managed with the utmost economy consistent with efficiency we are probably distributing to our members through this Bureau many times the value which we spend, besides transmitting to the public a clearer understanding of the problems and spirit of the profession Among the extensive publicizing of almost every other work and social effort in the world *our* offerings are very modest and suitably restrained Carefully guarded and enlarged they may well become a tremendous force in improving the future of medicine for the people and the profession

The assignment of the Secretary as General Manager and coordinator of the Society's work has been extremely satisfactory from the viewpoint of your President Gradually the functions of the Society's offices have been expanded and efficiency extended One of the outstanding improvements inaugurated has been the employment of a stenotype operator for Council meetings This provides complete and accurate histories of all Council meetings which is both desirable and essential Much of the increased work has been because of a growing membership roll, but necessary improvements are also costly The most unsatisfactory condition is that the Secretary and General Manager is constantly overworked The demands upon him are tremendous, beyond the appreciation of any but those most closely associated with him He has never suggested this in any way but we, who are close to him know it! With his background and long experience, Dr Peter Irving has proved to be most able and wise in his conduct as Secretary, General Manager, and Coordinator In all these departments he has been of inestimable help to your President

The Council has had an excellent record of attendance, has cordially supported your officers, has capably manned committees wherever committee activity has been demanded, and has discussed and voted the issues brought before them with conscientious earnestness Although regular Council meetings have averaged of greater length than those of former Executive Committees, we cling to the theory that a Council of larger size fully elected by the House of Delegates represents the House and the Society-at-large more accurately than a smaller body a large minority of whom are named by the President Whether the new Council and its small committees will make for economy can only be determined after several years During the current year nine of the fifteen members have had monthly journeys of from three hundred to eight hundred miles to accomplish, besides requiring hotel accommodations and meals There will be little change possible in this regard during the coming year The appropriations for the small committees of the Council have been less than for the old standing committees Theoretically the closely-knit elected Council heading all committees, except Special Committees of the House of Delegates and those providing arrangements for the Annual Meeting, should prove superior to the former regime in efficiency and economy Time only will prove or disprove this theory The President is grateful to the Council for its unfailing courtesy and help in service to the Society I take pleasure also in thanking every

member of Council and special committees, who have served with faithfulness and devotion

My hearty thanks also goes to the chairmen and members of the Committee of Arrangements, and the Committee on Scientific Exhibits for their enthusiastic effective work I believe that you will all be gratified by the quality of the Scientific Program and Exhibits, by the extensive exhibition of moving pictures, and the unsurpassed arrangements at the Annual Meeting

Recommendations

1 In the interest of increasingly representative government Active officers and committee chairmen of a County Society or those who having recently thus served are still identified with Society activities can usually best represent the Society in the House of Delegates Where the delegation is large or of moderate size this is easily accomplished if the County Society perceives the wisdom of such a policy, as is often the case. When the delegation is small it is more difficult but the wisdom is still apparent and the possibility, even in a delegation of one, remains

We therefore recommend that the House of Delegates formally suggests the adoption of such a policy to each and all County Societies

2 In the interests of providing experienced replacements in the service of the State Society by those who can serve for a period of years we *recommend* the policy of integrating a studied gradual increase of younger men in the activities of the State Society, without specification, rule, or limitation as to age eligibility

3 In the interest of expanding our service to our membership, we *recommend* the employment of a liason officer who shall serve the House of Delegates and Council in the cooperation and consideration of common problems in our relations with State Departments, welfare organizations, and Foundations, and in assisting the General Manager and Executive officer in any way the Council may direct We also *recommend* that his qualifications as to eligibility be exactly those prescribed for the General Manager in our By-Laws

In calling your attention to this certain need we declare our conviction that we demand too much of our unpaid officers, committee men, and Trustees so that in many instances their own professional work or the Society's activities are necessarily incomplete or their health is impaired by too much physical sacrifice

4 It becomes increasingly apparent that our income from dues may not be sufficient for this provision (Rec 3) and other necessary provisions for our membership (dues are less than three cents per day per member) Therefore we recommend that the state assessment upon members be increased by at least two cents per day We also recommend that the Trustees be authorized to budget whatever income from the Society's investments may in their judgment be needed to properly serve the Society—thus rescinding the action of the House forbidding the use of such interest We also recommend that no investment principal be expended at any time except after majority vote approval of the House of Delegates after recommendation by both the Council and Board of Trustees

In conclusion I thank the House of Delegates and the entire membership for the honor and privilege of serving as your President I have made every effort to think and do rightly for you I have had the glowing satisfaction of feeling your cordial support in these efforts, and of sensing your generous fraternal amiability concerning my shortcomings

Respectfully submitted,

CHARLES H GOODRICH, *President*

April 1, 1938

REPORT OF SECRETARY

To the House of Delegates, Gentlemen

Your Secretary has the honor to report on the conduct of the central office after his year's experience for the first time as a full-time official with expanded duties It has become very clear to him that the amount of work that lay ready to be done was far greater than he had anticipated, and that your decision to employ a General Manager on full-time was wise.

Only in that way could the steadily increasing calls for secretarial duties be best met

Office

The amount of correspondence passing over the Secretary's desk and the telephonic communications have multiplied amazingly In part, this has been due to the increase in membership as will be seen from the figures To some extent, it probably follows on the fact that the Secretary has been present in person at all times when not making trips in connection with the Society's work Also, the new managerial duty of coordination of the activities has contributed in no small measure

It has been his effort to study with great care the office methods long in use to develop the possibilities for informational service and to open the way for any new functions that might seem wise The same devoted clerical force has been tremendously helpful, carrying on the regular duties steadily and painstakingly, and always ready to meet sudden calls for exceptional performances

Membership

It is of interest that the calendar year 1937 again showed a large increase—1,040 new members having been added as shown in the following table

Membership—December 31, 1936	14,208	
New Members—1937	1,040	
Reinstated Members—1937	305	15,553
Deaths	203	
Resignations	82	285
		15,268
Dropped for non-payment of dues — December 31, 1937		333
		14,935
Elected and reinstated after October 1, 1937, and dues credited to 1938		594
		15,529

Honor Counties include Allegany, Chenango, Clinton, Columbia, Franklin, Genesee, Montgomery, Ontario, Orange, Orleans, Putnam, St. Lawrence, Schuyler, Steuben, Tioga, Tompkins, Washington, Wayne, and Yates

A comparison of the figures for the last ten years shows a slight drop between 1931 and 1933, but a relatively rapid increase in the years 1935 to 1937 as indicated below

	Total Members
1928	11,476
1929	12,010
1930	12,382
1931	12,968
1932	12,868
1933	12,848
1934	13,172
1935	14,064
1936	14,662
1937	15,529

Coordination of Activities

This has been a new responsibility, the purpose of which has been at one and the same time to save duplication of effort and to expedite action Your Secretary has had to feel his way to some extent, learning by experience where to place his effort to assist the new Council and its working committees, but feels satisfied that progress has been made which can be much further extended as the team settles down into its new harness

As will be seen in the report of the Council, the first need was to provide each member of that body with very full agenda and minutes, thus minimizing the time consumed in its regular meetings For many years the custom had been to compose only one office copy of minutes that was read in full at each meeting of the old Executive Committee While these agenda and minutes imply heavier stenographic labor, and some increase in expense, your Secretary has been assured by the Council that this plan makes its work easier and more certain and at the same time serves to supply reference material that each member has at his command at all times

With the various committees of the Council, and special committees of the Society, your Secretary, by attending meetings and by aiding in committee correspondence, has been able to save overlapping of activities and, he believes, to diminish time spent both in meetings and in travel expenses for the members

It is precisely in the realm of small working committee activity that coordina-

tion is most necessary For example, publicity is at times of extraordinary value in connection with such matters as pneumonia control, syphilis and cancer control, where the first line of offense lies in the Council Committee designated to study matters pertaining to public health Public health matters at times have economic features, again legislative connotations, and also publicity needs

It is the hope of the General Manager that he will be able to give in the ensuing year a very much larger and more rapid type of help in these ways and others, thus bringing the policies set by the Council into even more effective operation.

Your Secretary has attended over fifty different meetings since May 1937, not only the regularly recurring Council meetings and Board of Trustees meetings but also others that had to do with many different things—from public health to World's Fair arrangements, and from medical care to District Branch scientific and social meetings, and he is eager in the coming year to start closer and wider contacts with the hospitals and medical schools in the State

In connection with pneumonia control, your Secretary had the privilege of reading, in November 1937, before the American Medical Association Annual Conference of State Secretaries and Editors, a paper entitled "A State Medical Association's Part in A Pneumonia Control Program" Great interest was evidenced by that group It seems fair to state that the example of the New York State Society is very generally commended

Your Secretary is deeply grateful to the President, Members of the Council, Members of the Board of Trustees, the Executive Officer, and the Directors of the Bureaus of Workmen's Compensation and Public Relations, for their very fine cooperation throughout the year

Respectfully submitted,
PETER IRVING, *Secretary*

April 1, 1938

REPORT OF COUNCIL

To the House of Delegates, Gentlemen

The Council has the honor to report on its administration of the affairs and business of the Society since your last meeting on May 24-25, 1937 It begs to submit for your consideration the matters studied and the actions taken thereon, and to describe the manner in which it has met the wider range of obligations with which it was charged by the 1937 revision of the Constitution and By-laws

The assignment to a single Council of fifteen of all the duties previously spread between six Standing Committees, the former Council, and its Executive Committee necessarily placed on this newly constituted executive body a stiffer burden It was realized on the one hand that every member of the Council would have to be familiar at all times with all significant facts and on the other hand, that the work could be expedited and facilitated by setting up small "Council Committees" of two or three to filter through those situations which merited full discussion The House in its wisdom elected as Councilors men who had had the advantage of experience in all the different fields likely to engage attention

These smaller Committees were at once set up as shown in the following list and the Council has been able to conduct its work with what bids fair to be some saving in the travel expense involved

Medical and Related Research

Thomas H Cunningham, *Chairman*	Glens Falls
Frederic E Sondern	New York

Bertran W Gifford	Saugerties

Maternal Welfare (Reporting to the Council)

Charles A Gordon	Brooklyn
James K Quigley	Rochester
Ferdinand J Schoeneck	Syracuse

Legal Counsel Lorenz J Brosnan, Reappointment.
Attorney Thomas H Clearwater Reappointment.
Executive Officer Joseph S Lawrence Renewal of Contract.
Director of Bureau of Public Relations Dwight Anderson Renewal of Contract.
General Manager Peter Irving

The Council has met regularly on the second Thursday of each month, with the exception of July and August, beginning its deliberations in the morning and carrying them on through a greater portion of the afternoon at each session

It has extended an invitation to all its meetings to the Board of Trustees, the First Vice-President, the Vice-Speaker, the Assistant Secretary, the Executive Officer, the Director of the Public Relations Bureau, the Director of the Workmen's Compensation Bureau, and the Legal Counsel

In order to keep all members and guests fully informed of its activities and to supply material for ready reference, extensive agenda has been sent to all concerned, and stenotype verbatim notes have been made, from which exhaustive minutes have been compiled and distributed

* * *

The matters studied, the actions taken by the Council, and recommendations for your consideration are here recorded under subject titles

1 Public Health

With the assistance of its Committee on Matters Pertaining to Public Health (Drs Mitchell, Chairman, Farmer and McGoldrick), progress has been made in several fields

Pneumonia One-day "pneumonia institutes" were held in a hospital in each of the following five cities Rochester, Syracuse, Buffalo, Albany, and New York, under the combined aegis of the State Society and the State Department of Health The Society arranged programs with Dr Edward S Rogers, Director of Pneumonia Control of the Department of Health

The Department found it possible to pay travel expenses for physicians up to fifty in number on each occasion, and great interest was shown in the lectures and the clinic and serum therapy demonstrations of these post-graduate days

The example was followed in the City of New York for its own physicians Half-day "Refresher Courses" were held during January and again in March 1938

The Council received an enthusiastic report on a pneumonia film called "A New Day" which has been financed, at considerable expense, by the Metropolitan Life Insurance Company, and formally endorsed it to that Company The United States Public Health Service also endorsed this film It is now being shown to the public in regular motion picture houses

Cancer Cordial relations with the American Society for Control of Cancer have been maintained, through Drs Mitchell and Farmer of the Council, and Dr John M Swan, Executive Secretary of the New York State Committee of the American Society

Dr Swan's Committee has for the last twelve years been carrying on an educational program, directed to the layman, for the purpose of informing him concerning the danger signals that may mean cancer and of urging him to consult qualified medical practitioners at the earliest possible moment

It has always been its aim to keep the dissemination of knowledge concerning cancer in the hands of the organized profession The governing body of fifteen directors is composed of medical men in good standing in the Medical Society of the State of New York, three of them being past presidents

It has been the expressed hope of the New York Cancer Committee that Chairmen of County Society Cancer Committees will also act as Chairmen of the County Committees of the American Society for Cancer Control This arrangement continues to have the endorsement of the Council

The national society's more recently formed women's organization called, "The Women's Field Army" was recommended by the Council to the County Societies Its purpose is to secure small contributions from women to finance educational programs County Society Speaker's Bureaus can well aid, in the opinion of the Council, this campaign

The President, Dr Goodrich, responded to a request of the Governor for a representative of the State Medical Society to sit on the Commission created in 1937 to study the prevalence of cancer in New York State The Governor appointed Dr Floyd S Winslow of Rochester The personnel of that Commission follows

Assemblyman Frank A Gugino, Buffalo, Chairman
Senator Frederic H. Bontecou, Poughkeepsie
Senator Jacob J Schwartzwald, Brooklyn
Senator William J Murray, New York
Dr James Ewing, New York
Dr Floyd S Winslow, Rochester
Dr Edward S Godfrey, Jr, Albany
Assemblyman Nicholas A Rossi, New York
Assemblyman Harry R. Marble, Holcomb

Dr Winslow has brought several questions to the Council and, in particular, the final recommendations to be included in the report of the Commission subject to rewording by the Council It is expected that the phraseology approved by the Council will be used in the Commission's report

Syphilis In this field the Council, on request of Senator Jeremiah F Twomey, approved, subject to minor amendments to be sought by the Committee on Legislation, his bill requiring Wassermann tests in pregnancy The bill was later passed by the Legislature.

On request from the American Social Hygiene Association, the Council directed announcement in the JOURNAL of the selection of February 2, 1938, as the "National Social Hygiene Day"

2 Tuberculosis Case Finding

The Council authorized appointment of a committee of three to visit with a similar committee of the State Department of Health and visit Detroit, there to study at first-hand tuberculosis case finding as practiced under Dr Henry F Vaughan, Commissioner of the Department of Health of Detroit, Michigan The joint committee selected was

From the State Society
Dr James H Borrell, Chairman
Dr Frederick S Wetherell
Dr Frederic E. Elliott

From the State Department of Health
Dr George H Ramsey
Dr Robert E. Plunkett
Dr H Jackson Davis

This group spent two days in Detroit and Battle Creek, Michigan, on November 16 and 17, 1937 A final report is expected in the near future

3 The Deaf and Hard of Hearing

Dr Hambrook, as a Council Committee of One, was designated to continue the program of activity in this field which started five year ago As Vice-Chairman of the Temporary State Commission to Study Facilities for Hard of Hearing and Deaf Children, he has been in fortunate position to aid in carrying the work well forward

The Commission is constituted as follows

Jacob H Livingston, Chairman, Dr Augustus J Hambrook, Vice-Chairman, John H Black, Secretary, George F Rogers, Clifford C Hastings, Fred L Meiss, William J Sheldrick, Estelle E Samuelson, Dr Emily A. Pratt, Dr Edmund Prince

Fowler, Capt. Victor Skyberg, and Morris L Ernst, Counsel The following serve ex-officio John J Dunnigan, Perley A Pitcher, Oswald D Heck, Irving M Ives, and Irwin Steingut.

Much of the actual work has been undertaken by a scientific group made up of the medical members on the Commission and Miss E E Samuelson and Captain Victor Skyberg

The Commission has studied facilities in the State—two open meetings having been held in different parts of the State to inquire into the care given hard of hearing children and deaf children, both in private institutions and in the deaf schools of the State It has concerned itself with the lack of proper educational advantages in the schools of the State, and has made a study of the number of children requiring lip reading and other hearing aids, also, the number of qualified teachers available and the number required for a State-wide program of lip-reading instruction It has tried to determine the need for audiometer equipment to take care of requirements and of better utilization of all present equipment.

The Commission has made a very comprehensive report to the Legislature, a copy of which will be submitted as a supplemental report to the House It has asked for an extension of one year to complete its study, this to include adults as well as children.

It has asked also that the reporting bill, in charge of the Department of Health, be activated, and from such information obtained through Section 320-A of the Public Health Law, as well as from other sources concerned, that a compilation and register of all deaf and hard of hearing children and adults be created

Dr Hambrook is glad to report that the program, started five years ago, is about to be realized, and that deaf and hard of hearing children and adults, as well, will now be able to receive an education suitable to the handicapped condition of each individual

4 Preventive Medicine

The Council has effected through the medium of a small committee (Drs Groat, Watson, and Crampton) a study of the various aspects—general and particular—of the very interesting subject of preventive medicine

The matter of noise abatement was first gone into, having been referred to the Council by the 1937 meeting of the Section on Neurology and Psychiatry That Section felt that undue noise in municipalities was a growing menace to the health and well-being of citizens

The study has revealed that a number of cities of large size, notably Albany and New York, have gone into the matter very thoroughly It appears to be recognized by these city governments as well as by the "League for Less Noise" that, while laws are to some extent useful and necessary for instance, in connection with automobile horns and night noises, the solution of the noise problem depends chiefly upon education and co-operation of the public.

While no specific recommendations have been formulated by the Council, the study suggests that the Society might aid in this field as in other matters of public health in an educational manner

Consideration of the general subject of preventive medicine made clear the very wide scope of prevention Governmental services through departments of health, welfare, and education could and do practice mass preventive medicine Cooperation of the Society with these departments could be of great value Personal preventive medicine, on the other hand, belongs to the citizen and his own physician

The health examination, while an essential in medical care, is yet only a part It is not an isolated event purchasable wholesale in mechanized ways, it is important but only incidental to a well-rounded service of preventive medical care through life The Council Committee has submitted a recommendation that there be a change of emphasis from the health examination by itself to the ideal of continued life service This, the Committee based on the belief that a physician can best help the individual going to him with some disability or complaint if he has known of that man's health and illness during preceding years

In other words, this Committee favored what might be called a "continued health service throughout life It believes and

considers that the Council could to good purpose devise practical methods of application such as some form of life-time health record To accomplish this purpose, this Committee has recommended to the Council continued study looking toward practical education in preventive medicine of both the profession and the public

5 Maternal Welfare

The Special Committee on Maternal Welfare (Drs Gordon, Chairman, Quigley, and Schoeneck) set up by the House of Delegates, reports to the House, in the manner instructed, through the Council The report follows

1 It was agreed by the members of the Committee that a permanent organization of *county medical society maternal welfare committees* is still of utmost importance, contact to be made with committee chairmen, or secretaries should be asked who the committee chairmen are This work has been done in the past, and, whether stimulated by the State Society or not, considerable work is being done. Several counties are actively studying their local problems, and in a great many more are interested

The Committee feels very strongly that real progress will be made only if Dr Irving or Dr Lawrence every time they make a county visit, make a point of advancing the program

2 The State is so large and the problem so vast, that it would surely be of great value to begin *education of the physician by mail,* sending him standards for (a) prenatal care, (b) intrapartum care, and (c) postpartum care, as three separate pamphlets Previous committee advocated this too

As cost of printing and mailing may be considerable, the Council should be asked to inquire if other organizations might be willing to participate, e g, State Health Dept, Metropolitan Life, Commonwealth Fund, etc.

3 The *New Jersey plan* was thought excellent, but the Committee was informed by Dr Quigley that the State Department of Health were not favorably disposed toward such a plan for New York.

4 The possibilities and difficulties of *education of the public* were discussed

5 Next meeting in Rochester in March, Chairman to address the County Medical Society there.

The Council issued instructions that Recommendation 2 of this report be carried out by the Journal Management Committee through the JOURNAL

In October 1937 the Council considered the film entitled "The Birth of A Baby" which had been produced by the Mead Johnson and Company at the instigation of The American Committee on Maternal Welfare, Inc, of which Dr Fred L Adair of Chicago was the Chairman A number of the members had seen the preview, and the Council decided to forward to the sponsor, The American Committee on Maternal Welfare, Inc., an endorsement of this film as an educational effort looking toward improvement in maternal welfare

The Council was informed of similar endorsement by the United States Public Health Service, the American College of Surgeons, the American Public Health Association, the Department of Labor, and the American Gynecology Society The Colorado State Medical Society was known to have endorsed and approved this film also

While the decision of the Department of Education of New York State was against permission for public showing of this film in the regular moving picture houses, the Council was assured the Department's disapproval would not prevent the use of this film in New York State for educational purposes by non-commercial groups

6 Medical Education

Dr Farmer has continued to represent the Council in the field of medical education and the same satisfactory method has been pursued by him in arranging postgraduate lecture courses throughout the State outside of the metropolitan district

During the fall of 1937 the following subjects were covered in each instance with several successive lectures in the counties indicated

Cayuga	Obstetrics
Monroe	Miscellaneous
Orange	Obstetrics
Rockland	Obstetrics

In the spring of 1938 similar courses were given as follows

Chemung	Dermatology
Columbia	General Medicine

Jefferson	General Medicine
St. Lawrence	General Medicine
Steuben	Dermatology
Sullivan	Dermatology and Syphilology
Tioga	Infections

At the time of going to press, Dr Farmer reports that there are still other courses under preparation to be given some time before July 1

It is to be noted that the Council and the Trustees have considered this work so valuable that an appropriation of $5,000 for the year 1937-1938 was provided in the budget

7 The Journal

Production has continued in the same fashion as was initiated January 1, 1934 The Journal Management Committee, through which the Council supervises its publication as to content, has reported on the year 1937

The cost as compared with the three preceding years is shown in the following table and reveals a slight increase in total expense (payment to Mr Gardiner plus Committee expenditures) due largely to the steady increase in membership with, however, maintenance of the cost per member slightly below the One Dollar which has been appropriated each year from dues for this purpose

Year	*Total*	*Total Members*	*Per Member*
1934	$ 9,223 53	13,193	$ 70
1935	12,726 83	14,064	90
1936	14,366 72	14,662	97
1937	14,383 67	15,866	90

From present conditions at the time of writing this report it would appear probable that this satisfactorily low level of production cost may have to rise, but this new problem has not yet been fully solved

The scientific content during these years is shown in the following table, which indicates an increase in the number of articles used and total pages assigned

Year	*Number*	*Total Pages*
1934	159	696
1935	144	738
1936	191	1,220
1937	200	1,252

The remaining content has been steadily enlarged with addition of some further sections considered by the Committee desirable "Hospital News" and "Pneumonia Control Program" sections have been deemed valuable, and recently arrangements were effected with the State Departmnt of Health for "Public Health Notes" to be supplied by Dr Earp, the Medical Editor of that Department The "Correspondence" column, "Medicolegal" section, "Book Reviews," "Medical News," "Society Activities," and "Across the Desk" have been continued It is the constant effort of the Committee in this way to supply material of varied interest to readers

The Council has received comment from many sources which indicates satisfaction on the part of the membership in general with the progress of the magazine, and a steadily increasing reader interest Not only within the State has this been manifested, but the material in the JOURNAL has been increasingly utilized by other state journals

DIRECTORY

The Journal Management Committee has continued its duty of supervising the content of the Medical Directory of New York, New Jersey and Connecticut, copy being prepared in the Central Office

The following policies have been from time to time adopted by the Committee

1 Alphabetic street list to precede detailed list

2 Workmen's Compensation designations to appear with each name, a general sign in front before the membership star, and the special letters later

3 The assigned designation to be run, whether the doctor objects or not

4 Diplomates of National Boards to receive appropriate designations in capitals

5 Directors and Asst Directors of Hospitals to have special designation

6 Membership in Societies to follow these regulations

(a) The societies must be medical scientific organizations, both national and local

(b) Where lay members as well as physicians belong to an organization listing is to be omitted

(c) No listing to be made of membership in foreign medical associations

(d) Abbreviations to be used as heretofore for hospital titles

7 Fellowship in American College of Radiology to receive FACR

8 N Y Academy of Medicine Fellowship and membership to be indicated

Beginning with the 1937 edition, the State Societies of New Jersey and Connecticut took over the task of preparing copy for their own physicians

Technical Exhibits

The Committee has continued its supervision of the content of these exhibits which, like advertisements in JOURNAL and Directory, are required to follow the rule of acceptance by the Council on Pharmacy of the American Medical Association

8 Medical Publicity

With the aid of its Committee of which Dr Carpenter is Chairman, Drs Townsend and Welton, members, the Council has continued to effect suitable publicity through the Public Relations Bureau The policies laid down, and the output of the year are shown in the following summary

In the Fall of 1937, District Branch meetings of the Society were covered as usual with news releases sent to the daily press of each district by the Public Relations Bureau In addition, a new practice was begun of supplying the weekly press with special articles in plate form concerning these meetings This material was well received, and the continuance of this project is recommended

Special news releases were prepared and distributed to the press throughout the year concerning the postgraduate courses conducted under the auspices of the Council Committee on Medical Education

Additional releases were sent the press from time to time as occasion demanded on such subjects as compulsory health insurance, pneumonia, and concerning various addresses of the President of the Society "Beauty and Preventive Medicine," a talk delivered by Dr Goodrich was reprinted in "Vital Speeches of the Day" and reprints were sent to 12,000 persons on the mailing list of the Bureau

The Director of the Bureau, Mr Dwight Anderson, attended various committee meetings of the Society, in particular those of the Council Committee on Preventive Medicine, and the Committee on Matters Pertaining to Medical Care He attended meetings of the Committee on Library and Information Service of the World's Fair, of which he is a member, and the Committee on Medical Jurisprudence of the New York County Medical Society and the Association of the Bar of New York City He attended the meeting of legislative chairmen held at Albany, and throughout the year kept in close contact with organizations which are affecting public opinion as to matters related to the interests of the medical profession He continued the cordial relations with the press which have characterized the work of the Public Relations Bureau Increasingly, requests have come from special feature writers employed by magazines and syndicates for assistance in preparing articles for the press

The Bureau has assisted in maintaining cordial and cooperative relations with the New York State Department of Health, particularly in regard to the promotion of the pneumonia control program jointly sponsored by the two organizations

The Speaker's Service Bulletins have been continued with the following titles "Quo Vadis?," "What Is Propaganda?," "Mental Hygiene," "Medical Care in the Radio Forum," "Pneumonia," "What Next?," "Syphilis Must Go!," "Cancer," "Tuberculosis," and "Mother's Day" A new bulletin service called "Handbook Series" was begun March 15, 1938 with the title "Organizing the Speaker's Bureau" Titles to follow are "The Newspaper Interview," "The Radio Dialogue," "The 10-Minute Talk," and "The Newspaper Release"

A radio transcription was made of a talk by Dr Goodrich on "Health and Beauty" This was offered to radio stations throughout the State Ten stations used this material This innovation opens up a new means for moulding favorable popular opinion for organized medicine, now that the mechanical difficulties in disc manufacture have been successfully overcome

J Weston Walch, author of "On The Witness Stand," was employed to prepare a question-and-answer manuscript on state medicine He came to New York and worked with the Director of the Public Relations Bureau in collecting material and presenting it in suitable form for publication It was decided by

the Committee to hold this matter in abeyance until after the Annual Meeting when new material on the subject may be made available and added to the manuscript.

Analysis of magazine and newspaper articles in the labor press on the subject of health insurance indicates a renewal of agitation on this subject in that quarter It is felt that if the two warring elements in organized labor resolve their differences, which is definitely predicted in well-informed quarters, a situation may arise calling for the renewal of publicity to inform the public of the dangers of compulsory health insurance, a procedure which met with conspicuous success in the work of the Public Relations Bureau during the year 1937

Attention has been addressed to current radio programs as providing a crosssection of propaganda influences at work with relation to medical care Many programs have appeared in promotion of cooperative medicine, as well as compulsory health insurance The number of the former has increased measurably during the last year

The Director of the Bureau was one of the speakers at a conference of Science Writers held under the auspices of the American Medical Association, Chicago, Ill, October 30, 1937 The proceedings of this meeting appeared in the *Journal of the A.M.A*, January 1 and January 8, 1938

At the request of the New Haven, Conn Medical Society, the Director of the Bureau addressed that Society at its semi-annual meeting in Waterbury, October 28, 1937 He has been invited to speak to the members of the Woman's Auxiliary of the Medical Society of the State of New York at the Annual Meeting in May to explain ways in which the Auxiliary may be useful in combatting influences which tend toward lowering the standards of medical care

9 Legislation

The newly-organized Council Committee on Legislation (Drs Borrell, Hamilton and John L Bauer) proceeded immediately to inform itself regarding the instructions left by the House of Delegates relating to proposed legislation and as to rules and regulations governing legislative procedure and the operation of the Legislative Bureau in Albany

Several meetings of this Committee were held prior and subsequent to election time, for the purpose of studying the effect the election might have on the Society's future legislative program Among the provisions taken to establish a closer relationship with the County Societies have been frequent bulletins and wider circulation, impressing upon each county chairman the responsibility for the attitude his legislators might take on legislation in which the Society is interested, and active cooperation with the legislative committees of the Woman's Auxiliary The chairmen of the county auxiliary committees have been sent the legislative bulletins

Efforts have been made, as in past years, to enlist cooperation of sister professions and other organizations interested in the practice of medicine and public health

The annual conference of county society legislative chairmen was held in Albany on February 9, 1938, at which more than one-half of the County Societies were represented As usual, all of the bills that were available at that time were reviewed and action expressed

Through conferences with the proper interested and influential officials, the introduction of considerable undesirable legislation has been prevented The season is just now at its height at the time of writing this report (March 16), with the possibility that adjournment may occur before the end of March A supplementary report will be filed at the close of the session

Constitutional Convention In the matter of the coming Constitutional Convention to begin in April, the Council decided that its Committee on Legislation and its Executive Officer, Dr Lawrence, take the responsibility of close observation of the proceedings of the Convention, in order that no opportunity be lost to influence any phases of the work bearing on medicine

10 Workmen's Compensation

Through the Council Committee (Drs Elliott, Chairman, O'Gorman and Kaliski), the Director of the Workmen's

Beginning with the 1937 edition, the State Societies of New Jersey and Connecticut took over the task of preparing copy for their own physicians

Technical Exhibits

The Committee has continued its supervision of the content of these exhibits which, like advertisements in JOURNAL and Directory, are required to follow the rule of acceptance by the Council on Pharmacy of the American Medical Association

8 Medical Publicity

With the aid of its Committee of which Dr Carpenter is Chairman, Drs Townsend and Welton, members, the Council has continued to effect suitable publicity through the Public Relations Bureau The policies laid down, and the output of the year are shown in the following summary

In the Fall of 1937, District Branch meetings of the Society were covered as usual with news releases sent to the daily press of each district by the Public Relations Bureau In addition, a new practice was begun of supplying the weekly press with special articles in plate form concerning these meetings This material was well received, and the continuance of this project is recommended

The Director of the Bureau, Mr Dwight Anderson, attended various committee meetings of the Society, in particular those of the Council Committee on Preventive Medicine, and the Committee on Matters Pertaining to Medical Care He attended meetings of the Committee on Library and Information Service of the World's Fair, of which he is a member, and the Committee on Medical Jurisprudence of the New York County Medical Society and the Association of the Bar of New York City He attended the meeting of legislative chairmen held at Albany, and throughout the year kept in close contact with organizations which are affecting public opinion as to matters related to the interests of the medical profession He continued the cordial relations with the press which have characterized the work of the Public Relations Bureau Increasingly, requests have come from special feature writers employed by magazines and syndicates for assistance in preparing articles for the press

The Bureau has assisted in maintaining cordial and cooperative relations with the New York State Department of Health, particularly in regard to the promotion of the pneumonia control program jointly sponsored by the two organizations

The Speaker's Service Bulletins have been continued with the following titles "Quo Vadis?," "What Is Propaganda?," "Mental Hygiene," "Medical Care in the Radio Forum," "Pneumonia," "What Next?," "Syphilis Must Go!," "Cancer," "Tuberculosis," and "Mother's Day" A new bulletin service called "Handbook Series" was begun March 15, 1938 with the title "Organizing the Speaker's Bureau" Titles to follow are: "The Newspaper Interview," "The Radio Dialogue," "The 10-Minute Talk," and "The Newspaper Release"

A radio transcription was made of a talk by Dr Goodrich on "Health and Beauty" This was offered to radio stations throughout the State. Ten stations used this material This innovation opens up a new means for moulding favorable popular opinion for organized medicine, now that the mechanical difficulties in disc manufacture have been successfully overcome

J Weston Walch, author of "On The Witness Stand," was employed to prepare a question-and-answer manuscript on state medicine He came to New York and worked with the Director of the Public Relations Bureau in collecting material and presenting it in suitable form for publication It was decided by

cost of medical care against a non-insured employer At the present time there is no provision in the law to enable the Department of Labor or the Medical Society to protect the physician who has rendered service in a compensation case where the employer has failed to insure himself The significance of this will be appreciated when it is known that during the past year 665 awards amounting to $200,000 were made in such cases and in more than 800 court actions by the Attorney General, $130,000 was collected The Department of Labor has been vigilant in prosecuting employers for failure to comply with the law in this respect.

The Department of Labor has under consideration the names of sixteen physicians who have been authorized under the Workmen's Compensation Law and who have been found guilty of violations of various provisions of the Medical Practice Act under the Workmen's Compensation Law

Fifteen physicians have appealed from the ratings granted them by the Compensation Boards of the Medical Societies and in nearly every instance the decisions of the compensation board have been upheld One authorized physician was reported to the Industrial Commissioner by the District Attorney of New York County for unethical activities and his license was completely removed.

Another, guilty of unethical advertising and solicitation, suffered suspension of his license for six months

The Industrial Commissioner has reported that an examination of 9,000 cases disclosed that in a very large percentage no medical reports had been filed. Most of these have been minor cases and in some instances physicians have been induced by employers not to submit the reports required by law in return for which the employers agreed to pay the doctor's bill This practice must be stopped, and the Medical Societies have been urged by bulletins and notices in the STATE JOURNAL and County Bulletins to advise all physicians to comply with the law and submit the necessary forms in every case regardless of the importunities of employers This would tend to protect the interests of the injured claimant as well All C-4 reports should be notarized, and before the injured workman is discharged from treatment the physician should submit the final C-4 report indicating the exact date on which the employee may return to work.

Your Committee has been requested to appear before the Industrial Council at a hearing to be held on March 18 to decide the question of whether a physician applying for a medical bureau license may be permitted to operate more than one medical bureau under his own name This involves primarily the question of the provision of good medical care by a qualified physician and whether such physician through the employing of other physicians is violating the spirit of the Workmen's Compensation Act, in regard to competent and ethical medical care

Your Committee, through its Director, has been in constant touch with the various county societies throughout the State by correspondence and through personal contact in regard to matters of interest under the Workmen's Compensation Law

The Compensation Bureau has endeavored to act on behalf of the various compensation boards in matters requiring contact with the insurance carriers, insurance organizations, Department of Labor, and other interested groups

Your Director has spoken at a number of meetings throughout the State on Workmen's Compensation matters The Bureau has endeavored to act for various county societies in the settlement of bills pending the setting up of arbitration proceedings Many of such bills have been settled through contact with various insurance carriers and self-insurers The Bureau Service has been a focal point for contact with the medical profession in matters concerning Workmen's Compensation, a very important function, and becoming increasingly more important each year

The Director has requested the Industrial Commissioner to obtain the opinion of the Attorney General concerning the applicability of Section 13-g of the amended law which refers to the arbitration of disputed medical bills with the City of New York which is self-insured. The opinion of Mr Brosnan was requested, which opinion indicated that the City of New York as a self-insurer is not in any different position than any other party or person

Under date of March 12, 1938, the Industrial Commissioner has advised your Director that the Attorney General has ruled that the provisions of Section 13-g are general and statewide in their application and are not superseded by, nor in substantial conflict with, the provisions of the New York City Charter, but that the City is bound by the provisions of Section 13-g This information will no doubt be of great value to the compensation boards of those counties in which the municipality is a self-insurer

The Bureau has devoted a great amount of time to the preparation of the Workmen's Compensation ratings of all qualified

Compensation Bureau, Dr Kaliski, has submitted to the Council the following report of activities for the year ending March 31, 1938

To date a total of 14,778 physicians have been qualified throughout the State by the Compensation Boards and Committees of the County Societies In addition a total of 267 physicians have been qualified by the Homeopathic Society, making a grand total of 15,045 physicians (out of 23,578 physicians in New York State) qualified for Workmen's Compensation in the State

The following totals indicate the number qualified in each county

Albany	236	Niagara	144
Allegany	35	Oneida	187
Bronx	1660	Onondaga	318
Broome	185	Ontario	80
Cattaraugus	69	Orange	120
Cayuga	50	Orleans	22

Nassau	372		

During the year the members of the Committee have conferred informally by telephone and letter on numerous occasions Six regular meetings of the metropolitan members of the Committee were held and two in which all the members of the Committee participated Two additional special meetings of the Committee were held

Committee on Industrial Dermatoses A special committee on the Industrial Dermatoses, of which Dr Eugene F Traub is chairman, studied the relationship of industrial dermatoses to workmen's compensation held three meetings during the year and has made considerable progress Other members of the Committee are Herman Sharlit, *Secretary,* Howard Fox, J Gardner Hopkins, Beatrice Kesten, Oscar Levin, Marion Sulzberger, Louis Tulipan, John C Graham, Albert R. McFarland, G M Fisher, Earl D Osborne, and Mark Heiman

Committee on Radiology Examinations A special committee on Radiology examinations for qualifications of physicians in radiology held three examinations in the past year Twenty-four candidates were examined for various county societies throughout the State, of which ten were qualified. This Committee comprises William H Stewart, *Chairman,* Alfred L L Bell, John J Masterson, and Charles W Schwartz

Upstate Fee Schedule The Director represented the State Committee before the Industrial Commissioner, the Industrial Council, and the Compensation Insurance Rating Board on matters affecting policy and principles in relation to the amended Workmen's Compensation Law on twenty different occasions during the year

The Committee appeared before the Industrial Commissioner at an open hearing held in Albany in regard to the upstate fee schedule on October 25, 1937 Preliminary to this meeting the Committee called a special meeting that was attended by representatives of practically all the upstate Workmen's Compensation Committees in Albany on October 17 It was decided at this meeting to urge the Commissioner that the Metropolitan Fee Schedule be promulgated for the entire State, and this attitude the Committee supported at the hearing on October 25, at which time the members of the Committee, as well as representatives of many county societies, adduced facts to prove that the prevailing rates throughout the State were the equivalent of the Metropolitan Fee Schedule and that insurance carriers were paying bills in accordance with the metropolitan schedule for services rendered throughout the State. Additional letters of information bearing on the upstate fee schedule have been sent to the Industrial Commissioner since that time, but up to the present, no upstate schedule has been promulgated by the Industrial Commissioner

The Director has conferred with the members of the Homeopathic and Osteopathic Compensation Boards and a spirit of harmony prevails among these groups

Arbitrations During the year arbitrations of medical bills have been held for nine counties in the metropolitan area, and the sixty-seven sessions held lasted on an average of four hours each Bills amounting to $84,457 67—of which $70,745 52 was in dispute—were arbitrated The total awards amounted to $39,926.23, the total number of bills involved amounted to 808

Upstate arbitrations were begun on February 25, 1938 in Schenectady and Troy These involve seven counties, three being arbitrated in Schenectady in the morning and four in Troy in the afternoon Arrangements are now being made to inaugurate arbitration proceedings throughout the State based upon the Metropolitan Fee Schedule and the prevailing rates in the various communities

Revised Application Blank The Com-

cost of medical care against a non-insured employer At the present time there is no provision in the law to enable the Department of Labor or the Medical Society to protect the physician who has rendered service in a compensation case where the employer has failed to insure himself The significance of this will be appreciated when it is known that during the past year 665 awards amounting to $200,000 were made in such cases and in more than 800 court actions by the Attorney General, $130,000 was collected The Department of Labor has been vigilant in prosecuting employers for failure to comply with the law in this respect.

The Department of Labor has under consideration the names of sixteen physicians who have been authorized under the Workmen's Compensation Law and who have been found guilty of violations of various provisions of the Medical Practice Act under the Workmen's Compensation Law

Fifteen physicians have appealed from the ratings granted them by the Compensation Boards of the Medical Societies and in nearly every instance the decisions of the compensation board have been upheld One authorized physician was reported to the Industrial Commissioner by the District Attorney of New York County for unethical activities and his license was completely removed

Another, guilty of unethical advertising and solicitation, suffered suspension of his license for six months

The Industrial Commissioner has reported that an examination of 9,000 cases disclosed that in a very large percentage no medical reports had been filed. Most of these have been minor cases and in some instances physicians have been induced by employers not to submit the reports required by law in return for which the employers agreed to pay the doctor's bill This practice must be stopped, and the Medical Societies have been urged by bulletins and notices in the STATE JOURNAL and County Bulletins to advise all physicians to comply with the law and submit the necessary forms in every case regardless of the importunities of employers This would tend to protect the interests of the injured claimant as well All C-4 reports should be notarized, and before the injured workman is discharged from treatment the physician should submit the final C-4 report indicating the exact date on which the employee may return to work.

Your Committee has been requested to appear before the Industrial Council at a hearing to be held on March 18 to decide the question of whether a physician applying for a medical bureau license may be permitted to operate more than one medical bureau under his own name. This involves primarily the question of the provision of good medical care by a qualified physician and whether such physician through the employing of other physicians is violating the spirit of the Workmen's Compensation Act, in regard to competent and ethical medical care.

Your Committee, through its Director, has been in constant touch with the various county societies throughout the State by correspondence and through personal contact in regard to matters of interest under the Workmen's Compensation Law

The Compensation Bureau has endeavored to act on behalf of the various compensation boards in matters requiring contact with the insurance carriers, insurance organizations, Department of Labor, and other interested groups

Your Director has spoken at a number of meetings throughout the State on Workmen's Compensation matters The Bureau has endeavored to act for various county societies in the settlement of bills pending the setting up of arbitration proceedings Many of such bills have been settled through contact with various insurance carriers and self-insurers The Bureau Service has been a focal point for contact with the medical profession in matters concerning Workmen's Compensation, a very important function, and becoming increasingly more important each year

The Director has requested the Industrial Commissioner to obtain the opinion of the Attorney General concerning the applicability of Section 13-g of the amended law which refers to the arbitration of disputed medical bills with the City of New York which is self-insured The opinion of Mr Brosnan was requested, which opinion indicated that the City of New York as a self-insurer is not in any different position than any other party or person

Under date of March 12, 1938, the Industrial Commissioner has advised your Director that the Attorney General has ruled that the provisions of Section 13-g are general and statewide in their application and are not superseded by, nor in substantial conflict with, the provisions of the New York City Charter, but that the City is bound by the provisions of Section 13-g This information will no doubt be of great value to the compensation boards of those counties in which the municipality is a self-insurer

The Bureau has devoted a great amount of time to the preparation of the Workmen's Compensation ratings of all qualified

ment of Labor without a hearing or without the determination of causal relationship A study is being made of such cases with a view of recommending a procedure by the Department of Labor which will facilitate the payment for medical services under these conditions

Under date of December 15, a pamphlet containing a list of compensation claim men was sent to all county societies in order to facilitate actions between the county society and the various insurance carriers This pamphlet was at the request of the Committee through the kind cooperation of Mr Leon Senior, General Manager, and Mr I Sofferman, Director of the Arbitration Division of the Compensation Insurance Rating Board

Under date of January 13, 1938, Communication No 26 was issued concerning Rule 21 referred to above In this bulletin county societies were asked to urge all qualified physicians to comply more promptly in submitting the necessary forms under the Workmen's Compensation Law and urging physicians to send supplementary C-4 reports indicating progress of the case every few weeks to the Department of Labor and the insurance carriers This bulletin also indicated the necessity of physicians treating injured claimants for such period as it deemed necessary despite the request of the insurance carrier's physician to stop treatment. A method of procedure was suggested to assure the patient treatment as long as necessary without prolonging the treatment beyond that period necessary

Injection treatment of Hernia Under date of January 13, 1938, instructions were issued concerning the injection treatment of hernia

Under date of March 7, 1938, Communication No 27 was issued advising the physicians of the State of the ruling of the U S Employees Compensation Commission concerning the treatment of hernia by the injection method A supplementary paragraph was issued concerning the treatment of hernia cases by the injection treatment under the State Workmen's Compensation Law

Regional Conference On September 29, 1937, a regional conference was held for the Workmen's Compensation Boards of the Metropolitan Area at which time matters of importance affecting the administration of the Workmen's Compensation Law were discussed. This meeting was attended by the chairmen and members of all the metropolitan county societies

An extensive correspondence had been carried on with the various county societies on the question of the Upstate Fee Schedule Under date of November 3, 1937, a bulletin was issued to county society compensation boards outside the metropolitan area urging upon them the necessity of submitting to this Committee in notarized form statements of the prevailing rates for compensation work in their communities, all of which material was submitted to the Industrial Commissioner in an effort to have him promulgate the Metropolitan Schedule for the remainder of the State.

The Committee arranged for the Upstate Arbitrations and issued bulletins to the counties effected on January 26, February 8, and February 24, 1938

Upon invitation of the State Medical Society the Director and Chairman of the Committee participated in conferences with the members of the State Hospital Association in matters affecting the Workmen's Compensation Law

The Director of the Committee has appeared before the Industrial Commissioner and the Industrial Council to urge the latter to take action against certain insurance carriers for violation of Rule 23, promulgated by the Industrial Commissioner, and prohibiting the sending out of names of physicians by carriers to policyholders A number of hearings have been held before the Industrial Commissioner and the Industrial Council on this question, and a voluminous file of correspondence has grown up

Under date of February 17, 1938, a communication was sent to the president of the State Society, various members of the Council, and members of the State Committee urging them to use their influence in preventing the Industrial Commissioner from changing Rule 23 to permit the insurance carriers to submit a list of names to policyholders in Workmen's Compensation cases. This matter is of vital importance and your Committee has submitted a number of briefs on this subject to the Industrial Commissioner At the present time the matter is still pending before the Industrial Council

With the consent of the Council of the State Society the Committee recommended the drawing up of a bill to incorporate certain amendments to Section 13-f affecting the payment of medical fees It defines medical service so as to include x-rays, physiotherapy, anesthesia and pathological services and makes provision for the rendering of a bill by physicians in the employ of hospitals This bill is known as the Esquirol Bill, Senate Int. No 1119, and is now pending before the legislature

The Committee has also endorsed the bill introduced by the Industrial Commissioner to give the Industrial Board of the Department of Labor the right to assess the

directed that a conference be sought with the Commissioners of Health, Welfare and Education and the Law Revision Commission of New York State looking toward codifying and simplifying all these laws

On January 19, 1938 such a conference was held at which were present Drs Goodrich, Lawrence, Elliott, Hambrook and Irving of the Society, Drs George H Ramsey, Assistant Commissioner of Preventable Diseases, representing Commissioner Edward S Godfrey, Jr, and H Jackson Davis, Chief Medical Officer, representing Commissioner David C Adie, of the State Departments, and Dean Charles K Burdick, Chairman, Dean Young B Smith, and John W MacDonald, Executive Secretary of the Law Revision Commission

The representatives from the Law Revision Commission felt that this was beyond its scope because such an attempt would imply a study of the actual functioning and the need for change rather than the alterations themselves of the present laws It was agreed by the group that a study would be good, and that perhaps a commission appointed by the Governor at the instance of the Legislature would be the best agency to undertake this necessary work

Therefore, with the help of the Law Revision Commission representatives, a bill was drafted to create a commission for this purpose, and the Council instructed its Committee on Legislation to seek its introduction

Medical Expense Indemnity Insurance The matter of non-profit Medical Expense Indemnity Insurance, which was referred by the House of Delegates in 1937 to the Council with instructions to act for the House "when the economic group have satisfied that ad interim body that this is a fair and proper procedure for the State Society," was fully considered The Council approved the principle of non-profit Medical Expense Indemnity Insurance under proper control as presented to the House of Delegates at its 1937 meeting

Following this approval, it was discovered that there were planned by the Insurance department amendments to the insurance laws which contained certain proposals legalizing Indemnity Insurance that were not in conformity with the thought of the Council Dr Elliott was authorized to present the Council's ideas in this situation, and these have appeared to be acceptable to the Commission

Other Insurance and Group Plans for Medical Care Information has come to the Council of the existence of other schemes for voluntary health insurance, for some of which the approval of the State Society was sought but not accorded

The "Associated Physicians Service, Inc" is described as a four-cents-a-day plan for cases hospitalized This new plan is, however, organized on a profit-making basis and for that reason was not approved by the Council

"Bureau of Cooperative Medicine" of The Cooperative League of The United States sought approval, and conferences have occurred No decision has been recorded because full information on some points has not been forthcoming This organization has been widely advertised all over the country and appears to have international affiliations

An organization entitled "The Employees' Group Plan for Medical, Surgical and Hospital Care" was found to be endeavoring to get under way This was a three-cents-a-day plan covering twenty-one days in the Manhattan General Hospital Under the instruction of the Council, this matter was brought to the attention of the Insurance Department, and action was taken by the Department which brought this enterprise to a close

12 Medical Care vs Hospital Care

The Council became aware that the established hospital service plans in the State were enlarging very rapidly and the idea spreading to other states The certificates issued to those insured under some of these plans, particularly that of New York City, had been drawn up to include some degree of medical care The New York City plan has this provision

Hospital service includes bed and board, general nursing care, use of the operating room, use of the delivery room, ordinary medications and dressings, anesthesia when such service is supplied by the member hospital and administered by a salaried employee of the hospital, *laboratory examina-*

physicians appearing in the Medical Directory The Bureau serves as a repository for the qualifications of all physicians throughout the State and serves as a means of reference for employers, insurance carriers, and other interested parties Numerous inquiries are received daily concerning the qualifications of physicians This is an important function since many additions and changes are made between the issues of the Medical Directory Every effort is made to keep this file of qualified physicians accurate and up to date

One of the most important functions of the Bureau is that it serves as a clearing house for inquiries and complaints concerning physicians in various parts of the State, the Director acting to facilitate action between outside agencies and the Department of Labor and the medical profession It also serves to coordinate the work of the various county society compensation boards in respect to workmen's compensation matters

The Committee is now undertaking a standardization of qualifications for general practitioners and specialists, which it is hoped will serve to guide the various county societies, as well as to clarify the situation in regard to physicians' qualifications

The Bureau contemplates holding regional conferences on workmen's compensation matters to be participated in by the chairmen and members of compensation committees This will be educational as well as serve to standardize workmen's compensation procedures throughout the State

From time to time the Committee has reported to the Council matters concerning workmen's compensation and requested authorization when necessary to proceed.

On June 17, 1937, the Director reported to the Council that he had been informed that the Industrial Commissioner intended to hold a hearing on the Upstate Fee Schedule, at which time the Commissioner was prepared to recommend a reduction in the fees to be paid physicians outside the Metropolitan Area The Director reported that he had requested postponement of such hearing until the fall of the year, at which time a large representation from the State Society and the upstate Societies would be arranged to appear before the hearing This matter was then referred back to the Committee on Workmen's Compensation for action

On November 11, 1937, the Director of the Bureau reported results of the conference on the Upstate Fee Schedule held in Albany, and also reported on the hearing held by the Industrial Commissioner in Albany, October 25

On December 9, 1937, a report was submitted to the Council covering the expenses of the Committee and Bureau An increase in the budget was requested amounting to $1,639 97 On motion the recommendations were approved and referred to the Board of Trustees for consideration

At a meeting of the Council on January 13, 1938 the Committee requested approval for the reintroduction this year of legislation introduced last year concerning amendments to Section 13-f of the Workmen's Compensation Law Approval was granted by unanimous vote

11 *Medical Care*

In addition to the two duties assigned to the Special Committee of the Society on Matters Pertaining to Medical Care, to "define the term, adequate medical care," and to "formulate principles and problems of a State health policy," there was a third charge which has appeared to fall more in the Council's field This was to "confer with the government agencies and other organized medical groups so that differences in conception of definition of terms and applicability of principles and procedures may be ironed out in conference"

It had seemed well to the Special Committee that it relinquish this duty as it involved contacts with the State Welfare, Health and Education Departments, for which Drs Hambrook, Elliott, and Louis H Bauer had been chosen to act for the Council

Conferences with the Welfare Department in connection particularly with revision of methods of certifying indigency and financing medical care to indigents were held early in the Fall This Department had superseded the old T E R.A, and it was agreed by all concerned that revision of regulations on medical care was much needed The matter has progressed very slowly, but should reach a point where concrete work can be done looking to formulation of rules satisfactory to both the Department and the profession

Welfare Law Revision Being aware from a study by the former Committee on Economics of the fact that the present welfare laws as they apply to medical care of the indigent contain many discrepancies and much overlapping, the Council

ital Association that the Council con-dered it necessary to foster such legis-tion Two bills directed toward this id have appeared in the Legislature

The Council, in this connection, *recom-tends*

That the Society consider requesting the American Medical Association and the American College of Surgeons to refuse or withdraw approval of hospitals that do not comport themselves in accordance with the principles of Organized Medicine,

That this affirmative action be transformed into proper resolutions, and that the Delegates of the House of Delegates of the Medical Society of the State of New York be instructed to present and support them in the American Medical Association House of Delegates meeting,

That it would be well for the Society to consider methods and means of disciplining members of the Society who participate in medical schemes, contracts, or plans that do not conform to the principles outlined in the Booth Report as revised (The resolution embodying this thought will be presented to the House in a supplementary report—Peter Irving, M D, Secretary)

13 Nursing in New York State

For two years the Council, through its Committee on Nursing Education (Drs Irving and Greene), has watched closely the attempt of the State Nurses Association to bring, by appropriate legislation, all those who practice nursing as an occupation in the State under control of a Nurse Practice Act. It has known of the peculiar situation which has existed for many years, wherein nurses fully trained must be licensed and registered, but others—good, bad and indifferent—may "nurse" without restriction, except the choice of the patient or physician

During the last year the Registered Nurses numbered 37,000 roughly and the "others" of varied experience, 41,000 It was made evident to the Council that this anomalous situation was not to the best interests of the public and of the medical profession, which is responsible to the public for the correct choice of nurses in every case of illness

The legislation sponsored by the State Nurses Association had been before the 1937 Legislature, but because of opposition, secured no action With modification it was reintroduced in the 1938 Legislature, meeting less opposition It sought to set up licensing of all nurses in two groups, the professional fully educated Registered Nurses and a group designated "Nursing Aides" at first, and later termed "Practical Nurses"

To the Council this seemed a step in advance toward clearing up an anomalous situation, and the present bill was formally endorsed to the State Nurses Association

In transmitting this official action to that organization, the Council suggested that if future revisions be needed, it deems it advisable that the State Society be accorded the first opportunity to pass on legislation that may be planned This suggestion was cordially accepted by the President of the State Nurses Association

14 Federal Subsidies for Consultation for Obstetric and Pediatric Patients

Through the United States Public Health Service a grant has been made to be administered by the State Department of Health to finance consulting service to obstetric and pediatric patients who may or may not be able to pay for ordinary attention, but unable to afford consultations Discussions have been held between Drs Mitchell and Farmer and Commissioner Godfrey of the State Department of Health looking toward the establishment of a sound policy Some progress has been made, but final agreements await further study

15 The Matter of Contract Practice

Inquiries having come to the Council for advice concerning the propriety of members making contracts to give medical care under certain circumstances, the Council decided to recommend to the

tions consisting of urine examinations, complete blood counts, basal metabolism tests, stool examinations and examinations of pathological tissue and other equivalent examinations, and ordinary x-ray examinations, and other customary routine care. The benefits do not include admission of patients to member hospitals for laboratory or x-ray examinations solely for diagnostic purposes Hospital service shall include the care of obstetrical cases only after the first year from the effective date of any subscription agreement. Obstetrical care shall include any condition resulting from pregnancy, the care of the mother and shall include the ordinary nursery care of the new-born child during the duration of the hospital stay of the mother

In 1937 the House in its wisdom revised "Proposition No 3" of the Booth Committee Report of 1933 to define more strictly "hospital care and medical care," as follows

There is in every community a group of people below the "comfort level," on whom the costs of medical care impose a heavy burden. These are self-respecting people of the salaried class in most instances, whose living expenses are met from their weekly earnings For them the greater part of medical costs comprise charges for hospital and nursing care.

To lessen the burden of hospital and nursing care for this wage-earning group, your Committee recommends the adoption generally of a plan of hospital insurance, whose principles may be stated as follows

(a) Hospital care shall mean provision of bed, board, general nurse service, customary surgical dressings and medicines, and other facilities of the institution not including medical care as defined in (b)

(b) Medical care shall mean any procedure or service by a licensed physician acting under authority of Section 1250 of Article 48 of the Education Law of the State of New York.

(c) Hospitals making contracts with organizations, acting under Chapter 595 of the laws of 1934—the Insurance Law of the State of New York—shall not implicate themselves with conditions inconsistent with the principles and definitions herewith stated

(d) The operation of such hospital insurance in any community shall not discriminate against any reputable institution, whether voluntary or proprietary

(e) Admission of patients for care under the benefits of such hospital insurance shall be only through reference by a private physician. Exemption to this provision shall be made for the exigency of any emergent need.

(f) Certificates of membership in such association shall specifically state that the insurance does not provide for any medical care as defined in (b) Actual wording of the certificate to be approved by the local County Medical Society or Societies

(g) Every hospital insurance plan operating under the aegis of this proposition shall develop the details of its operation to conform with such principles and policies as from time to time may be determined by the local County Medical Society or Societies.

(h) When it is so desired by the local County Medical Society satisfactory representation from the membership of the local County Medical Society on the Board of Management of the hospital insurance shall be arranged

This "Proposition No 3" of the Booth Committee of 1933, before the 1937 revision, read as follows

(a) Members of employed groups may receive for the payment of a small annual sum hospital care in semi-private accommodations for a period of 21 days in any one year, such care to include bed and board, general nursing service, x-ray and laboratory examinations.

(b) All reputable voluntary hospitals and some proprietary hospitals be entitled to participate in this plan.

(c) Except in emergencies, all admissions of patients cared for under this plan must be made through the patient's personal physician.

(d) Certificates of membership issued to subscribers shall state specifically that the service does not cover the fee of the patient's physician.

(e) In each community under the supervision of its organized medical group there shall be developed the details of this plan so as to meet local conditions and make it workable.

The Council, considering this situation of increasingly great importance because of the steady enlargement of this type of service decided to call the attention of those in charge of the hospital plans, and the Boards of Trustees and Superintendents of hospitals throughout the State to the revision of "Proposition No 3," soliciting acceptance of the principles involved in the revision This was done in the late Fall of 1937, and the Council is pressing for acceptance by service plans of this equitable and wise revision

Arrangements for a formal conference with the directors of the Associated Hospital Service of New York have been made which will shortly take place

In connection with "group practice of medicine by hospitals," the Council adopted a resolution that the Society, through its proper channels, have introduced in the Legislature a bill to clearly define a prohibition of any hospital or corporation acting as the vendor of medical service Through the Committee to Confer with the State Hospital Association, due notice was given to the Hos-

the Council under the By-Laws, Chapter XV, Section 1 (a)

Except by approval of the Council of the Medical Society of the State of New York, no physician shall be an active member in a County Medical Society other than that of the County in which he maintains legal residence or has his principal office.

20 Amendments to By-Laws

Two amendments have been thought necessary by the Council, and are hereby submitted.

CHAPTER XV

An additional Section 7 to read "Sec. 7 The component County Medical Societies, their officers, committeemen and members shall not initiate any policy, propose any legislation or participate in any activities that are contrary to the policies of the Medical Society of the State of New York. This shall not be interpreted to prevent a component County Society from initiating any policy applicable to the profession within its boundaries and within the framework of adopted policy of the Medical Society of the State of New York"

CHAPTER I

Section 2 An additional sentence at the end to read

"(d) Dues and State assessment of a member elected or re-instated after November 1st shall be credited to the ensuing calendar year, all rights and privileges of membership, however, dating from the time of election."

21 Annual Meeting—Arrangements

This Committee has reported to the Council through Dr Charles A Anderson, Chairman, as follows

The Medical Societies of the five Metropolitan Counties — Kings, New York, Queens, Bronx, and Richmond—are happy to welcome for the third time in six years the Medical Society of the State of New York at its Annual Meeting to be held May 9, 10, 11, 12, 1938

The Hotel Waldorf-Astoria, which on the last two occasions, gave such excellent service, will again be the headquarters for the meeting

Great care has been exercised in selecting rooms of sufficient size for the different sectional meetings In past years it has been somewhat difficult to estimate attendance at these meetings with accuracy The best choice possible under the circumstances has been made It has been requested that the Secretaries of the different Sections and Sessions this year make a definite count and report it to the General Manager, Dr Peter Irving, for reference on future occasions

Provision has been made to select proper space for the very excellent group of Scientific Exhibits, and this year the motion picture films in connection with these Exhibits have been arranged for in what it is thought is a more satisfactory manner One of the large rooms seating four or five hundred has been made available for a continuous moving picture program, which will continue throughout the full four days of the meeting

Convenient space has been found for the meetings of the Woman's Auxiliary in the Hotel, as will be seen in the program as issued

22 Annual Meeting—Scientific Work

The Council Committee on Scientific Work has reported the completion of a full scientific program for the four days, only two full meetings being necessary for the purpose That Committee consists of Drs Albert F R. Andresen, Chairman, and Howard C Taylor, Jr, and the Section and Session Chairmen (the names of the officers of the various sections and sessions will be found in the Scientific Program)

The two general sessions this year will be held on Tuesday afternoon and on the afternoon of the new fourth-day, Thursday It is hoped that the choice of speakers will attract a general attendance. At the session on Thursday afternoon, the last paper will be by Dr Russell W Bunting, Dean of the School of Dentistry, University of Michigan, Ann Arbor, Michigan, and the Committee has advised the First and Second District Dental Societies through the Secretary's office that their members will be welcome This invitation is in keeping with the formal decisions of the dental and medical groups to provide, when possible, joint meeting occasions

23 Annual Meeting—Scientific Exhibits

Dr William A Krieger has reported, as Chairman of the Council Committee on

House adoption of the following resolution

Whereas, force of financial and other circumstances appears to be leading physicians more widely to enter into contracts for provision of medical care, and

Whereas, some such contracts with industrial firms, groups, or lodges, tend to establish sub-standard rates for professional service, and

Whereas, the Members would profit from advice from authoritative sources on the propriety of any given contracts before entering into them, and

Whereas, the American Medical Association has established a standard in relation to contract practice, Chapter III, Article VI, Section 2, of its "Principles of Medical Ethics"

Therefore, be it resolved, that the House of Delegates suggest to all component County Medical Societies the setting up of a mechanism through proper committees to aid the members in judging contracts under the official standards before they are undertaken

16 Delegates to the American Medical Association

Official information came that re-apportionment of representation in 1937 allows New York two more delegates beginning with June 13, 1938, the next meeting of that House of Delegates The Council designated the two first on the list of alternates for 1938–1939 to act as delegates This is the smaller class of seven and it will be necessary in 1939 to elect nine in that class for 1940–1941, thus equalizing the two classes

A formal invitation was extended by the Council to the American Medical Association to hold its Annual Meeting in 1940 in New York City

17 Exchange of Delegates with Connecticut and New Jersey State Societies

After formal invitations had passed between the New York Society and these two State Societies, the official designations are now complete for the forthcoming three State Society Annual Meetings in 1938

FROM CONNECTICUT

Delegates

Dr Stanhope Bayne-Jones, New Haven
Dr D Chester Brown, Danbury

Alternate Delegates

Dr Herbert Thoms, New Haven
Dr Walter R. Steiner, Hartford

TO CONNECTICUT

Delegates

Dr Chas Gordon Heyd, New York
Dr Nathan B VanEtten, New York

Alternate Delegates

Dr Floyd S Winslow, Rochester
Dr William A Groat, Syracuse

FROM NEW JERSEY

Delegates

Dr William J Carrington, Atlantic City
Dr Thomas K Lewis, Camden

TO NEW JERSEY

Delegates

Dr William A Groat, Syracuse
Dr Frederic E Elliott, Brooklyn

Alternate Delegates

Dr Edward T Wentworth, Rochester
Dr O W H Mitchell, Syracuse

18 Nominations for State Department Positions

On official requests there were nominated the following members for appointment by the Commissioners

DEPARTMENT OF EDUCATION

To serve on the Board of Nurse Examiners Dr Nathan B VanEtten, New York, to succeed himself (As alternates) Dr Clayton W Greene, Buffalo, and Dr Peter Irving, New York.

DEPARTMENT OF HEALTH

To serve on its new Advisory Board on Narcotic Control Dr Homer L Nelms, Albany

19 County Society Membership

A few requests have come to the Council for permission to hold membership in County Societies other than those of the county of residence or principal office Exercising its right of discretion, this has been granted where the reason satisfied

Scientific Exhibits, as follows, under date of April 1, 1938

The space allotted for Scientific Exhibits at the One Hundred and Thirty-second Annual Convention of the Medical Society of the State of New York, consisted of the check room on the second floor foyer, and the south walls of the first and second balconies of the Grand Ballroom in the Waldorf-Astoria Hotel

In this space there were accommodated forty-nine exhibits There was a total of fifty-five exhibits accepted, three of which consisted solely of moving pictures, which were shown in the Scientific Motion Picture Exhibit.

Owing to the large response the available space was entirely filled by January 1, 1938, and applications were closed on this date. Subsequent to that time there were approximately thirty applications received which, because of the limitation of space, could not be accepted.

Plans were copied, signs made, and all necessary construction work done by the Waldorf-Astoria staff, the bill will be rendered therefor per itemized account to the Medical Society of the State of New York.

The Committee has submitted the following *recommendations*

1 That relatively more space be allotted to Scientific Exhibits in order to accommodate the increasing demand for these facilities

2. That space allotted to Scientific Exhibits be divided into pre-determined units of stated size, and that these units be sold by number to the respective exhibitors, for a nominal sum in accordance with a pre-determined scale of charges This would automatically eliminate many undesirable features of the present system.

The Committee notes its appreciation for the excellent quality of the material offered for exhibition and for the co-operation of the members of the Medical Society of the State of New York in bringing this project to a successful conclusion

24 Miscellaneous

Who's Who Among Physicians and Surgeons Inquiries from many sources as to the propriety of supplying personal information for appearance in this forthcoming publication led the Council to look fully into the matter It was found that this book, which has appeared at times in past years, carries no advertisements and depends for its financing entirely upon the sales The editors make their choice of names for appearance on a set of standards of eligibility, to which no exception could be taken

Information from the Secretary of the American Medical Association was to the effect that in that office the book had been found very useful, because it contains data about the physicians listed, which appears in no directory or other book

The Council recorded its opinion that there is no objection to physicians allowing themselves to be listed in this way and that the decision belongs entirely to the physicians themselves

Reimbursement for Official Travel Expenses Certain bills reached the Trustees after the statutory thirty days from the time they were incurred, and also after the three months further extension which the Board can allow for cause, and, on suggestion of the Trustees, the Council *recommends* that the By-Laws be suspended to allow reimbursement to

Dr William D Johnson Carfare to and from 1937 Atlantic City American Medical Association House of Delegates	$ 37 00
Dr John H P Cummins Travel expense attending Executive Committee and Council meetings 1936-1937	184 00
Dr Clarence V Costello Travel expense 1937 Scientific Work Committees	63 00

Respectfully submitted,

PETER IRVING, *Secretary*

REPORT OF THE TREASURER

To the House of Delegates, Gentlemen

The report of the Treasurer is presented in large part by the appended auditor's statement of the Society's finances for the calendar year 1937 As this overlaps the activities of two administrations, it fails to show clearly the state of the treasury at the date of the Annual Meeting and, therefore, requires a supplementary report which, as last year, will be made at that time An endeavor was

REPORT OF THE BOARD OF TRUSTEES

To the House of Delegates, Gentlemen

In the year which has elapsed since the last meeting of the House of Delegates your Trustees have performed to the best of their ability and judgment the duties imposed upon them by the Constitution and By-laws The conservation of the funds of the Society has been a matter of deep concern The self-imposed depression afflicting the country is reflected in the value of securities and in doubts concerning the safety of investments With the able assistance of the Treasurer the Board has exercised all possible care to maintain our investment securities at the highest possible level of safety Continuing the policy of the previous year as authorized by the House of Delegates, a portion of our funds were invested in common stocks as a hedge against the inflation which may result from continued governmental extravagance As a further precaution necessitated by the increasing uncertainties of the business outlook a substantial part of our investment income has been placed in savings banks The result of this policy is shown in the Treasurer's report.

The security of our investments is not our only cause for concern If, during the past twenty years the Society had increased its expenditures in proportion to its income at the same rate as it has during the past few years, your Trustees would have had no trust fund to worry about It is inevitable that our expenditures must be increased to meet the increasing demands of the changing social order Every member profits by the activities of the Committee on Workmen's Compensation The cost of protection must be met The added expense of Social Security cannot be avoided It may well be that the welfare of our profession can be secured only by an increase in our dues

These newer and necessary costs render it all the more necessary for the House of Delegates, the Council, and the various committees of the Society to exercise increasing care in voting requests for appropriations The Trustees have no power to make recommendations or to initiate policies They may only approve or disapprove requests for money If they approve without exercising their discretion, they become a mere rubber stamp On the other hand their disapproval may constitute a veto of the action of the House of Delegates or of the Council The exercise of this veto power is one which any board must use with the greatest reluctance even when it appears to the Trustees that the execution of some recommendation requires the expenditure of a greater sum than was anticipated For example when the Committee on Trends was constituted by the action of this House, the Board was disturbed and embarrassed by requests for the approval of expenditures exceeding $17,000 00 during the first year of this committee's existence It was pointed out, however, that much of this expense was of a non-recurring character since it represented the purchase of expensive equipment Nevertheless the budget for July 1, 1936 to June 30, 1937 contained an appropriation for the Committee on Trends and the Public Relations Bureau of $20,300 00 In February of the same year this committee was granted an additional appropriation of $2,200 00 to be used as a revolving printing fund The budget for the year ending June 30, 1938 appropriates $19,000 00 for this committee. These figures are cited not in criticism of the Public Relations Bureau but to illustrate the difficulty of anticipating the expense of new activities

The income from membership dues is at present roughly $153,500 00 per year The last budget adopted called for expenditures of $149,000 00 This leaves a very narrow margin for unforeseen emergencies and for additional requests which invariably come to the Board of Trustees during the year If we are to continue the policy of accumulating a reserve to guarantee that the Society will always have a fund to be used if necessary to defend the profession against social or political forces inimical to our profession, it is obvious that either an increased income or a diminished outgo must be provided The foregoing considerations were among the reasons which impelled the Trustees to postpone action on the request of the Journal Management Committee for a new contract with the publisher which contract required an addi-

Auditor's Statement

We have made an examination of the balance sheet of the Medical Society of the State of New York as at December 31, 1937, and of the statement of income and capital for the year then ended In connection therewith, we examined or tested accounting records of the society and obtained information and explanations from employees of the society We also made a general review of the accounting methods and of the income and expense accounts for the year, but we did not make a detailed audit of the transactions

The scope of our examination, in accordance with instructions issued to us by the society, did not embrace the auditing of expense vouchers and invoices in support of disbursements The division of the assets, liabilities, income and expenses by funds, is included herein as shown by the books of account without examination of the minutes of the society and other related records which were not made available to us Neither were we advised of the dates of creation, purposes and/or restrictions of the various funds

In our opinion, based upon such examination, the accompanying balance sheet and related statement of fund additions and deductions and fund capital, fairly present, in accordance with accepted principles of accounting consistently maintained by the society during the period under review, its position at December 31, 1937, and the results of its operations for the year then ended

WOLF AND COMPANY,
Certified Public Accountants

Dated at New York, New York,
February 2, 1938

(Report of Treasurer—Continued from page *536*)

made to approximate the calendar and fiscal years by a resolution of the Council, but this was declared unconstitutional by your Counsel and will require amendment by the House of Delegates It is to be hoped that a more satisfactory arrangement can be developed

Attention may be called, however, to a few salient features of the Treasurer's Report It is a satisfaction to record that no further defaults in securities held by your Society have been sustained during the past year The amount in default remains at about $25,000 with a loss of interest to December 31, 1937 of $4,680 None of the stocks purchased in accordance with the resolutions passed by the House of Delegates have failed in dividend payments, but reductions from this source may be looked for in the near future

In view of the irregularly distributed receipts from County Societies, available cash has been deposited in savings banks until required for current expenditures, thus earning for the Society from otherwise idle funds, the sum of approximately $800 during 1937

At the time of this report it is not possible to state satisfactorily the difference in costs between the present Council expenditures and the arrangement previously in vogue as the set-up under which the Society now functions has existed only since the time of the last annual election

The cost of conducting official publications (Journal and Directory) will be found in the report of the Journal Management Committee, included in that of the Council

The Society's expenditures have been kept within budgetary allowances to the date of this report, except for certain emergency outlays approved by the Board of Trustees

Increased costs of conducting your Society's affairs during the coming years must be expected, due to expanding activities of various officers and committees, as well as the necessarily larger office staff Another item is the Social Security tax, to which your Society is also liable

Your Treasurer desires in conclusion to commend the office force for their efficient conduct of the Society's accounts and the County Societies for their prompt transmissions of the State Society's assessment

Respectfully submitted,
GEORGE W KOSMAK, *Treasurer*
April 1, 1938

Medical Society shall call a meeting of its Board of Censors to which the appellant shall be invited

"Ten days' notice of the date and place of that meeting shall be given to the appellant by registered mail

"At such meeting the Board of Censors shall have present a stenographer so that the minutes of the meeting may be stenographically recorded.

"The Board of Censors shall have present at that meeting any person or persons who wish to give proof of any alleged act or acts of the appellant which would establish his ineligibility for membership in the respondent County Society

"All witnesses shall first be sworn by a notary public, and their testimony stenographically recorded

"The appellant shall have the right to be present at said meeting or any adjourned meeting thereof, with counsel if he so desires, and the appellant or his counsel shall have the right to cross-examine any and all witnesses who may appear against him

"The appellant shall have the further right, if he so desires, to testify under oath and to call any witnesses on his behalf who shall also be sworn by a notary public and testify under oath

"The Board of Censors of the respondent County Society shall have an equal right to have an attorney present, if it so desires Such counsel or any member of the Board of Censors shall have the right to cross-examine the appellant or any witness that may be called on his behalf

"The Board of Censors shall have the right to adjourn such meeting, but such adjournment or adjournments shall not be for an unreasonable time

"When all of the testimony both of the appellant and the respondent County Medical Society shall be concluded, the County Medical Society shall at the next regular meeting following the conclusion of the hearings aforesaid submit its report, together with all the data, to the membership of the respondent County Medical Society, and the membership shall vote thereon In doing so, the Secretary shall first read to the members attending such meeting not only the report of the Board of Censors upon the appellant's application, but also all of the testimony taken at any hearing or hearings

"We do not wish to be understood as passing on the merits of the appellant's application, but we do feel in the interests of both parties, and in the interests of orderly procedure, the matter should be disposed of in this manner"

This decision was duly transmitted by the Secretary in writing to both respondent and appellant

Respectfully submitted,

PETER IRVING, *Secretary*

April 1, 1938

REPORT OF THE COUNSEL

To the House of Delegates, Gentlemen

Your Counsel herewith submits his Report of activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1937, to and including January 31, 1938

We have had a very busy year both in court and in consultation A report of this character must necessarily only state conclusions While the appended figures give some indication of the amount of work done they do not adequately portray the details of the work nor do they give any true indication of the responsibility assumed by our Department

At the outset of this report your Counsel wishes to record his appreciation for the assistance and cooperation furnished him by your officers and committeemen The Society is operating under a new setup made possible by the amendments to the Constitution and By-Laws passed last year It is already apparent that the new machinery is functioning smoothly and there can be no question but that the Society has benefited by the changes effected

Your Counsel has been impressed by the industry and earnestness with which your officers and committeemen have applied themselves to the many questions which come before them for solution

In making his report your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions (a) The actual handling of malpractice actions before courts and juries and in the Appellate tribunals, (b) counsel work with officers, committees, and individual members of the Society, and (c) legislative advice and activities

Litigation

Your Counsel again desires to point

tional expenditure by the Society of some $6,000 00 per year The proposed contract was for five years which in view of existing uncertainties appeared to the Trustees to be too long a term

No contract made by the Society can become effective until approved by the Board of Trustees For the proper exercise of this function the Trustees must have complete information concerning all matters connected with such contract The audit of Professional Journals Incorporated with whom the Society contracts for the publication of the Journal and Directory shows for three years ending December 31, 1936 a gross income of $247,745 23 It does not seem illogical that the Board which must approve a contract involving so large a sum of money should in some way participate in the making of the contract Proper study by the Trustees of all the factors involved after a contract has been arranged means an enormous duplication of effort and time The responsibility of approval implies the necessity for a thorough investigation If the Trustees are not to investigate before approving a contract but are to proceed on the assumption that the committee making the contract has made no error, the provision of the By-laws requiring such approval should be repealed Approval without full information is meaningless and does not afford the protection intended by the adoption of the By-laws in question If, on the other hand, the Trustees participate in the making of contracts, they will necessarily be fully informed concerning the facts involved The Board of Trustees recommends to the House of Delegates that the By-laws be amended to permit such participation

Respectfully submitted,
GEORGE W COTTIS, *Chairman*

April 1, 1938

REPORT OF BOARD OF CENSORS

To the House of Delegates, Gentlemen

In the matter of exclusion from membership of an applicant, Dr Donald R Keller of West Hampton Beach, in the Suffolk County Medical Society, the Board of Censors of the Medical Society of the State of New York on February 5, 1938 heard an appeal from the decision of the County Medical Society

There were present at this meeting Drs Theodore West, Irving Gray, Bertran W Gifford, Leo P Larkin, Thomas W Maloney, H W Ingham, Murray M Gardner, Charles H Goodrich, President, and Peter Irving, Secretary, Lorenz J Brosnan, and Thomas H Clearwater

There were also present Drs Edwin P Kolb, Secretary, and Paul Nugent of the Board of Censors of the Suffolk County Medical Society

Dr Keller appeared in person without counsel

After full consideration of the grounds for appeal, the records furnished by the Suffolk County Medical Society, and testimony by Dr Paul Nugent for the Suffolk County Medical Society, the Board of Censors of the Medical Society of the State of New York unanimously rendered the following decision

Pursuant to the authority conferred on us by Section 6 of Chapter VI of the Constitution and By-Laws of the Medical Society of the State of New York, and in the interest of orderly procedure, we hold the decision appealed from should be modified to the extent that the appellant's application for membership in the respondent County Society shall still be considered open and undecided, and that the entire matter be remanded to the County Society for further action in accordance with the mandatory instructions contained in this decision

It appears without dispute that the appellant physician duly applied for membership in the respondent County Medical Society, his application for membership was rejected by the said County Medical Society, that the respondent County Medical Society has not submitted any stenographic data as to what took place at the meeting or meetings of the Board of Censors of the said Society, nor in lieu thereof has any resume of these proceedings been submitted

It appears further without dispute that the appellant was not present at the meeting or meetings of the Board of Censors, nor was he invited to be present thereat.

In remanding this matter to the County Society for further action we do so with the following mandatory instructions

"Within one month from this date, i e., February 5, 1938, the respondent County

The State Society has an Insurance Committee which works in cooperation with your Counsel and with your authorized representative, Mr Harry F Wanvig This Committee considers and passes on all problems that may arise in the operation of your Group Plan

Table II gives a comparison of the number of members insured in 1935, 1936, 1937 and 1938, and the number of members in the County Societies and the percentage of insured members in the County Societies and in the entire State Society

Counsel Work

During the period of this report your Counsel prepared for the Society's JOURNAL articles in the nature of editorial comment These articles have included the following

Wills—Conditional Bequest to Hospital

Unlicensed Practitioners—Unlawful Practice of Medicine

Surgeon's Responsibility for Acts of Hospital Nurse

Proof Required to Establish Malpractice Case

Compensation of Physician Contingent on Outcome of Litigation

Malpractice—Requirement of Expert Testimony to Establish Cause

Liability of Infant for Medical Services

Libel and Slander—Physical Examination

Medical Care Under Workmen's Compensation Law

Hospitals—Responsibility for Injuries Sustained by Irrational Patients

Violation of Harrison Narcotic Act as Involving Moral Turpitude

Evidence—Opinion Testimony Based Upon False Hypothesis

Personal Injury Action—X-ray Examination of Plaintiff

TABLE I

out to the membership as he has done in the last few years that careless, hasty, and unjustified criticism by one physician concerning the work of another often leads to the commencement of a malpractice action Your Counsel believes that such unjustified criticism is not often deliberately made but frequently the effect on the patient is precisely the same as if the criticism were motivated by malice.

Little need be said with respect to the hazard of a malpractice action to the practicing physician It is ever present and the physician should not lose sight of the fact that his rights so far as the facts of any given case are concerned, rest entirely in the hands of a lay jury

Since the beginning of the Fall Term of court last year two important changes have been made affecting the trial of actions *First,* women are now permitted to serve on juries, although their service is not mandatory Many women in the Metropolitan area are taking advantage of this privilege and have volunteered for jury duty *Second,* verdicts may now be rendered by a jury if ten of the twelve reach an agreement These changes have not been in effect long enough to reach any definite conclusion as to whether they will affect malpractice actions favorably or otherwise

A word should be said with respect to our Group Plan It was organized by the State Society many years ago so that the membership would have an opportunity to eliminate the financial hazard of a malpractice action The justification for this plan, as well as its successful operation are matters of record It is pleasing for your Counsel to be able to state that the Yorkshire Indemnity Company, the present carrier under our Group Plan, has cooperated splendidly with your Counsel The officers of this Company and their investigators have demonstrated a desire to do everything to further the interests of the Group Plan and the members who have taken advantage of it

It is with pleasure that your Counsel again reports the fine work in the field of litigation of his associate, Mr William F Martin Mr Martin's ability as an advocate, as well as his personal qualities, have won for him expressions of approval from judges, lawyers, and doctors throughout the State

Mention should also be made of the splendid work of Mr Thomas H Clearwater, the Attorney for the Society Mr Clearwater through the years has had close contact not only with your officers and committeemen but also with many individual members of your Society Mr Clearwater is a gentleman of exceptional ability and character and your Counsel wishes to commend him for the work that he has done during the past year

Mention should also be made of the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical

With this preliminary statement we note that there were commenced in the present reporting period 175 actions as against 184 actions reported during the previous reporting period These figures do not, of course, include a number of claims outstanding in which suit may ultimately be brought Throughout the year your Counsel has been in conference and consultation with many claimants and their attorneys and frequently we have successfully demonstrated to them that in fact and in law no valid claim exists

The Table of Comparisons appended hereto shows that we disposed of during the present reporting period 217 cases as against 251 cases during the previous year Of the 217 cases disposed of during the present reporting period 48 cases were settled and 165 actions were successfully terminated in favor of the physician In 4 cases judgment was rendered in favor of the plaintiff

Of the cases in the Appellate Courts we were successful in three instances

We note from Table I that there were pending as of January 31, 1938, 493 cases as against 535 cases pending January 31, 1937

In concluding our remarks under this heading, we again wish to point out as we have done so often in the past that litigation and insurance protection are inextricably interwoven From our experience we can assert without hesitation that no physician can practice his profession in this State with peace of mind unless he has taken the precaution to insure himself in adequate limits against the ever present possibility of legal action being taken against him

Malpractice—Judgment of Surgeon as to Methods
Responsibility of Surgeon for Acts of Nurse
Hospital's Suit to Recover for Physician's Services
Medical Societies—Power and Right to Enforce By-Laws
Responsibility of Physician for Acts of Special Nurse
Incorrect Diagnosis as Malpractice

Your Counsel has also digested and there have been published in the STATE JOURNAL case reports upon malpractice actions which it has been felt were of special interest to the members of the profession The case reports which were published during the previous year are as follows

Diathermy Burn
Alleged Failure to Deliver Placenta Intact
Treatment of Cyst
Emergency Treatment of Nose Bleed
Ulcer Following Use of Heating Pad
Plastic Surgery on Nose
Operative Treatment of Diverticulum
Treatment of Asthma
Alleged Malpractice in Operation upon Knee
Glass in Hand
Death of Child Owing to Ruptured Appendix
Diathermic Burn
Treatment of Arthritis
Death Following Injection Treatment of Asthma
Needle Breaking Case—Broken Needle in Pleural Cavity
Treatment of Stye
Diabetic Gangrene
Claimed Negligent Treatment of Infant
Claim of Foreign Body in Throat
Treatment of Lichen Planus
Negligent Plastic Operation
Claimed Failure to Remove Inflamed Appendix
Needle Breaking Case—Broken Needle in Child's Leg
Treatment of Injuries Sustained in Automobile Accident
Failure to Diagnose Dislocation of Wrist
Incision of Fistula
Injury Following Intravenous Injection

It is pleasing for your Counsel to learn from the members of your Society throughout the State that they enjoy reading these reports and articles and that they find them to be interesting and instructive

In addition to his other duties your Counsel receives frequent requests for opinions, orally and in writing, on various topics Some of the matters upon which advice has been given (in writing) are the following

1 Inquiry from a general practitioner of medicine as to the measure of damages in a personal injury action for loss of professional earnings

2 Inquiry from a group of physicians with respect to the necessity for a written consent to operative procedure in the case of pupils at a private school whose parents reside at great distances

3 Inquiry from a local health officer concerning the extent to which the policy issued by the insurance carrier under the group plan sponsored by the Medical Society of the State of New York would cover actions against a health officer

4 Inquiry from various physicians for information as to where copies of certain laws, particularly the medical practice act, are obtainable

5 Inquiry from a physician holding a policy of malpractice insurance with a company other than the carrier approved by the Medical Society of the State of New York concerning procedure as to the defense of an action brought against him

6 Inquiry from a physician concerning the possible complications which might result from public statements which he contemplated making concerning the purported reliability of a product advertised in certain medical publications

7 Inquiry from a member of the Economics Committee of a component County Medical Society with respect to the legal status of a corporation alleged to be engaged in the practice of medicine

8 Inquiry from the Board of Censors of a component County Medical Society concerning the ethical situation involved when a physician affiliates himself with a birth control clinic

9 Inquiry from the secretary of a County Society who had received a letter from a former patient of one of the members of said society complaining with respect to alleged neglect on the part of the physician, seeking advice as to what disposition should be made of the complaint

10 Inquiry from a group of physicians constituting the staff of a not-for-profit hospital seeking answers as to the following inquiries

(a) What is the general law with regard to patients' charts?

(b) Is it permissible for a patient to obtain a hospital chart without consent (1) of the attending physician? (2) of his attorney? (3) without a Court order?

(c) Does the law grant the lay board of a

*A — number of members in County Society, B — number of members insured, C — percentage insured

tion Law The suing physician had not been authorized to render compensation medical care as required by the 1935 amendments to the Statute It was the contention of the attorney for the physician *first,* that this amendment could not deprive the physician of his common law right to sue for services rendered, and *second,* if the amendments attempted to do so it was unconstitutional It was further contended that the physician having acquired a license from the State could not have been subjected to further tests laid down by the Workmen's Compensation Law

The question involved in this case was vital to organized medicine for this action struck at the very foundation of the amendments to the Workmen's Compensation Law

At the time of the writing of the report last year the case had been decided adversely to the physician by a unanimous Appellate Division, and permission at that time had been obtained to appeal to the Court of Appeals

Your Counsel filed a brief as amicus curiae on behalf of the Medical Society of the State of New York and we are happy to say that the decision of the Appellate Division was upheld The plaintiff physician then took the case to the Supreme Court of the United States and only recently that court decided against the contentions of the plaintiff

This very interesting case, which resulted in a sweeping victory for organized medicine was carried through the Supreme Court, the Appellate Division, the Court of Appeals, and the Supreme Court of the United States

Other Counsel Activities

Your Counsel acting with the Committee on By-Laws has examined various proposed Amendments to the Constitution and By-Laws of the State Society and of a number of component County Societies and has rendered advice and made suggestions in connection therewith

As attorney for the Board of Censors of Your Society, your Counsel was present and gave advice at a hearing held by that Board in connection with an appeal by a physician whose application had been rejected by one of the component County Societies

Your Counsel has frequently conferred and given advice to Dr David Kaliski, Chairman of the Committee on Workmen's Compensation, in regard to the many questions which have arisen during the operation of the Workmen's Compensation Law Your Counsel is constantly in communication with Dr Peter Irving, Secretary and General Manager of the Medical Society of the State of New York, in regard to the many legal questions that have arisen in connection with his work

Legislative Advice and Activities

When called upon to do so your Counsel has examined and given advice with respect to the bills affecting the medical profession that have been introduced into the Legislature

Conclusion

In closing this report we do so by expressing our grateful appreciation for the cooperation furnished us by many members of your Society in the defense of malpractice actions This cooperation has been furnished both in court and consultation Without this generous assistance it would not have been possible to obtain the results shown by this report.

Respectfully submitted,
LORENZ J BROSNAN, *Counsel*

February 1 1938

REPORT OF THE COMMITTEE TO CONFER WITH THE STATE HOSPITAL ASSOCIATION

To the House of Delegates, Gentlemen

Your Committee, which you continued in office at your last meeting, has found it necessary to hold but two meetings during the year, the first being a meeting of its own members only, and the second, a joint conference with the appointees of the State Hospital Association In addition, personal conferences have been held between the Chairman of

hospital the privilege of setting fees for services rendered at the hospital by members of the staff?

11 Inquiry from a physician in charge of a private sanatorium as to whether it would be proper to notify a previous patient by mail that a Wassermann examination showed a positive reaction

12 Inquiry from a physician specializing in x-ray work as to whether when a physical examination is arranged for the benefit of the defendant in a personal injury action, there is an implied understanding that the examining physician is entitled to see any and all x-rays taken with reference to the accident.

13 Inquiry from a component County Medical Society seeking a definition of "moral turpitude"

14 Inquiry from a Committee Chairman of a County Society seeking information concerning

(a) The legal status of giving contraceptive information to private patients by physicians
(b) The legal status of a birth control clinic.
(c) The legal and ethical status of a physician associated with a birth control clinic

15 Inquiry from a physician with respect to the legality of a proposed operation for the purpose of sterilizing a man, the father of four children, who feared that his wife's health would be jeopardized by further childbirth

16 Inquiry from a physician as to instances in which it would be safe to treat a patient under the age of twenty-one years without the consent of the parents

17 Inquiry from a physician as to the type of surgery which a physician is entitled to perform under specific ratings under the Compensation law

18 Inquiry from a physician as to the extent to which a Welfare Officer is entitled to use discretion in interpreting the Public Welfare Law

19 Inquiry from a physician seeking guidance as to the method of testifying as an expert witness in Court.

20 Inquiry from a physician specializing in plastic surgery seeking a form of operative consent in an attempt to avoid possible litigation based upon breach of warranty

21 Inquiry from a physician as to the extent that he, as chief of a hospital clinic, could be held liable in malpractice actions brought by patients treated upon his service

22 Inquiry from a physician seeking information regarding the formation by a group of physicians of a society for the special study of anatomy

23 Inquiry from a physician engaged in the practice of neuropsychiatry concerning possible litigation in which he might become involved as a result of the execution of commitment papers

24 Inquiry from a physician for information concerning the "growth, cause and cures" of malpractice suits

25 Inquiry from a physician seeking advice concerning the particular instances in which it would be legal to perform sterilization operations

26 Inquiry from the secretary of a County Society concerning the right of a medical inspector of schools to inform a school board or a school administrator of the existence or the suspicion of tuberculosis in a teacher or employee or in an applicant for employment as such

27 Inquiry from a committee of a component County Medical Society as to whether a County Medical Society is entitled to draft legislation for presentation to the local municipal government or the State Legislature when such measures are contrary to the legislation favored by the Medical Society of the State of New York.

28 Inquiry from a physician as to the method of procedure to be followed in an attempt to put out of business a corporation alleged to practice medicine.

29 Inquiries from the secretary of a component County Medical Society as to the method of determining whether a particular crime evinces moral turpitude

30 Inquiry from a component County Society concerning suggested amendments to the Constitution and By-Laws of the State Society for the purpose of providing that it should not be mandatory upon a County Society to automatically accept a member of another County Society in good standing who has changed his residence and has located within the former county

31 Inquiry from a component County Medical Society as to whether a Commissioner of Public Welfare is entitled under the law to arbitrarily fix the number of visits a physician may make upon welfare patients for which he may be compensated

Szold v Outlet Embroidery Company

In our report last year we called the attention of the membership to the above entitled action because of its great importance in connection with the operation of the Workmen's Compensation Law. In the case under consideration a physician brought suit against an employer to recover for medical services rendered to an injured workman of the employer, who had been injured in the course of his employment and thus came within the provisions of the Workmen's Compensa-

looking toward cure of the abuses which had cropped up under the old Workmen's Compensation Act, and then, recently, toward revision of certain features of the Hospital Insurance Plan certificate, particularly here in New York, looking toward sharper definition of the terms "hospital care" and "medical care" not only for hospital insurance practice, but also for wiser arrangements even outside this insurance Thereby it hopes to prevent what seems now to be only an acorn from growing into a corporate practice tree

To be more specific, hospital insurance as originally devised included, within the Medical Society's expressed formula, some medical care This last year the Medical Society became convinced this formula should be changed When it became aware very recently that those promoting the Hospital Service Plan were saying in Philadelphia and Baltimore that medical care to a certain extent must be given to make the insurance a "go", the Medical Society deemed it time to call a halt on this score Furthermore, it should be noted, I think, that this local organization, now at 500,000 and sure to be rapidly increased, is of such a size that any lack of wisdom in its certificate will become a matter of such magnitude that desirable changes would be increasingly difficult to institute That is why the Medical Society wrote recently to the Chairmen of the Boards of Trustees and Superintendents of some 200-odd hospitals and also to the officials of the several Service Plans in the State to apprise all concerned of the conclusion reached by the Society, and to stimulate thought along the line of revision for the future Let me recall the decision, reached by this conference group last Spring and accepted on both sides, that "it would be better to exclude such service from future agreements as early as possible, or to provide in such contracts for the payment of hospital, of roentgenologist, of pathologist, and of anesthetist for their services"

As far as these redefinitions and rephrasings go in the hospital insurance field, the hospitals will not in any way be bothered financially but only in bookkeeping, but when it comes to hospital customs as to special services to private and semi-private patients outside of insurance patients, a new situation exists that in the Medical Society's opinion implies the danger of development of corporate practice There is here a chance that the doctor may be used unwisely to make income for the hospital Realizing fully the needs of hospitals and the practical conveniences of simple bills for patients and of salaries for full-time workers, the Medical Society believes there is here a problem which calls for constructive solution in such fashion that the danger be fully averted The Society is definitely committed to support of such legislation in the coming Session as will leave no doubt in anyone's mind This, I am reporting in accordance with our understanding last year In view of controversy two years ago, I suggest that an attempt be made today to seek some accord on this phase.

Finally, the Medical Society has recorded its opinion that a higher degree of authority might well be vested in some organization of the hospitals in order that negotiations between the Society and the hospitals be on an even basis Recognizing that it, the Medical Society, can control only its members and that the Hospital Association can only strongly persuade its member hospitals, it is thought that perhaps the hospitals could create an even more responsible organization than now exists It was the incident of advertising last Summer that gave rise to this thought Much more important than the incident itself was the report that the hospital concerned was of the opinion that the Hospital Association had not sufficient authority to direct its actions

Mr Chairman, I have explained as best I could the Medical Society's attitudes Differences of opinion I know exist as to these methods of reasoning I suggest that these points be thrashed out

1 Can this group agree that practice of medicine by hospitals is undesirable?
2 Do customs in force at present actually forecast corporate practice—or buying and selling or vending of medical care, particularly as to anesthesia, x-ray, laboratory work, physiotherapy, etc.?
3 Where should the line be drawn in salaried work for these services?
4 Can a body be formed with more authority than present Hospital Association?
5 Attitude of Hospital Association on legislation against vending of medical care?

No definite agreements were reached in that meeting, but progress was made along the lines indicated There seemed no question on either side but that practice of medicine by hospitals was undesirable, but there was considerable difference of opinion as to just what constitutes *practice of medicine by hospitals*

With regard to forming a *body with more authority*, the Hospital Association group stated that it had recently set up a mechanism for discipline of its member hospitals

As to *legislation*, no conclusions were reached except that passage would be

the Hospital Association Committee and the Secretary of the State Society, representing the Committee Chairman

At its own meeting in October 1937 your Committee considered at length the present developments of the three-cents-a-day hospital insurance service in New York City Information was received to the effect that this service had passed over 500,000 subscribers and was aiding in the promotion of similar services in Philadelphia and Baltimore It was reported that superintendents of hospitals in Philadelphia and in Baltimore had been told that this insurance could not be sold without the inclusion of medical care to the degree that exists in New York City

Possible dangers that may lie in the present arrangement were fully discussed The amount of medical care might be increased to a point where the hospital was actually buying and selling medical care, indulging perhaps in corporate practice of medicine

It was decided, on motion duly seconded and carried, that the boards of trustees of the hospitals of the State be asked to appoint some fully responsible party to negotiate with the Medical Society of the State of New York

It was further decided formally that the Chairman and the Secretary of the Committee discuss with the Associated Hospital Service in New York City the question of excluding any medical service from all further contracts or renewal of contracts

Your Committee also made the following *recommendations* to the Council

"That the State Society, through the proper channels, seek introduction in the Legislature of a bill to clearly define the prohibition of any corporation, including hospitals, from acting as the vendors of medical service"

"That the State Society consider methods and means of disciplining members of the Society to participate in the medical schemes, contracts or other plans that do not meet with the approval of the Society and do not conform to the principles outlined in the Booth Report (as revised)"

"That the State Society consider requesting the American Medical Association and the American College of Surgeons to refuse or withdraw approval of hospitals that do not comport themselves in accordance with the principles outlined by organized medicine of the State"

These three recommendations were duly presented to the Council, in whose report will be found the action of that body thereon.

Later in the year, after the Council had communicated with over 200 hospitals in the State and with the various hospital insurance services, your Committee sought a conference meeting with the representatives of the Hospital Association It presented to the joint meeting the following memorandum, read by the Secretary, explaining its reasons for asking the conference

The Medical Society sought this conference with the idea of advising the Hospital Association that it has reached certain conclusions on the solution of some problems which it considers are of grave import for the public, for the hospitals, and for physicians alike, and also to invite discussion looking toward establishment of constructive policies for the future.

Much has been accomplished already through these conferences that was relatively easy What remains is more difficult. Situations arising insidiously appear to be fraught with real dangers to the best interests of the three groups It is the Medical Society's thought that the time has now come for action

Mr Chairman and Gentlemen, I can best present these problems, set forth the Medical Society's idea, and provide a course for discussion to follow, with a brief historical retrospect.

The Medical Society has watched, as have the hospitals, the drying up of private philanthropy and the attitudes of financial desperation that have resulted It has also watched with grave concern the development of certain customs and ways that seem to it to portend the possible replacement of private practice of medicine by corporate practice of medicine This is the center from which the Medical Society's thoughts radiate, and I do not believe any here will dispute the statement that a change of such kind would be bad for the public, for the hospitals, and for the profession

It is this danger which led the Medical Society, four years and more ago, to take action

to maintain and elevate the quality of medical care, with special emphasis on postgraduate education.

Professional Refers to physicians, dentists, pharmacists, and nurses

Service Any medical procedure or service performed by individuals licensed under authority of the appropriate sections of the Education Law of the State of New York, or under their direction

Maintain Includes the whole field of preventive and public health medicine, such as periodic health examinations, immunization campaigns, syphilis, cancer, tuberculosis, pneumonia and mental disease control, mental hygiene, maternal and child welfare Encourages physicians to think and practice as public health officials

Restore Includes whole scope of curative medicine with necessary facilities for modern medical practice

Good health Used in the common sense meaning of the term It does not aim at impossible perfection

Palliate Refers to measures employed to modify the course of incurable disease, and to prevent or relieve physical and mental pain and distress

Principles and Problems of a State Health Policy

Erasmus said, "The greatest folly of which a man is capable is to sit down with slate and pencil to plan out a new social world" Your Committee believes that the service problems confronting physicians and the public today can best be solved by a process of orderly evolution

We recognize that these problems are many and complex, owing to the interrelation of the interests of the parties concerned In stating the problems of a State Health Policy and indicating the principles to be followed in dealing with them, it has seemed to us best to divide the responsibilities involved into three categories

I Responsibilities of physicians, both as individuals and as organized groups
II Responsibilities of the general public.
III Responsibilities of governmental agencies

I Responsibilities of physicians

Physicians are concerned primarily with developing and maintaining a high quality of medical care, and the providing and safeguarding from lay encroachment of this competent professional service is the paramount prerogative and duty of organized medicine

To meet this responsibility we recommend that

1 The Council, through its Committee on Medical Education, emphasize the importance of proper selection of students entering medical schools, so that ethical and moral fitness, as well as educational qualifications, be maintained.

2 The State Society devote special study to the problem of improving still further, the opportunities of its members for postgraduate education, and that a survey of the facilities for postgraduate study available in each county be undertaken by the local society, with the continuing cooperation of the State Society

3 As the organized profession assumes responsibility for providing a high quality of ethical medical care, it may be necessary to seek legislative authority to enforce discipline of its members In addition, we recommend to your favorable attention the encouraging of County Societies in forming groups of councillors, who would be available for entirely confidential and unofficial, but often sorely needed advice to members on vexed points of medical or ethical problems

4 As the non-medical public is less qualified to judge of the adequacy of medical care than are the physicians who supply it, it becomes a point of honor with the profession to exert every effort to maintain and elevate the quality of medical service which each physician delivers It is our duty, moreover, to enlighten the public, by every legitimate means of publicity, as to the importance to them of competent medical care. In this connection, care should be taken to correct the false emphasis which has too often been discernible in campaigns for diphtheria immunization, etc., namely, the describing of permission for preventive treatment as a privilege sought by physicians, instead of a valuable service which the physician is ready to supply on request of the patient.

II Responsibilities of the non-medical public

It is the function and duty of the non-medical public to provide and set up the economic machinery to support competent medical service.

This includes the provision and maintenance of proper educational facilities, hospitals, and laboratories required for

more difficult against the opposition of the Hospital Association group

With regard to revision of the Hospital Certificate, the Council delegated to your Committee full authority to contact the Associated Hospital Service in New York City in the effort to persuade that organization to revise its Certificate in accord with the re-phrased Booth Proposition No 3 This conference has been arranged for in the near future

Drafts of the bills designed to prevent vending of medical care by hospitals, which the Council had approved in principle, were later transmitted by the Secretary to the Chairman of the State Hospital Association Committee No official comment has been received in reply up to the date of writing this report

Respectfully submitted,

FLOYD S WINSLOW, *Chairman*

April 1, 1938

REPORT OF SPECIAL COMMITTEE ON MATTERS PERTAINING TO MEDICAL CARE

To the House of Delegates, Gentlemen

This Committee has been charged with two specific duties

1 To recommend a working definition of "Adequate Medical Care" which shall serve as a yardstick in future discussions of the subject
2 To formulate the principles and problems of a State Health Policy

The members of the Committee have approached their duties with a full realization of the difficulties involved in these tasks The term "Adequate Medical Care" has been used so widely and with so many diverse implications that it has sometimes assumed the status of a meaningless phrase In its broadest aspect, it includes the provision of proper sanitation, housing, clothing, food and recreational facilities, as well as preventive and curative medical, dental, nursing and hospital service

It is believed, however, that the problem of providing the material necessities is primarily an economic one, and that while as such, it involves us as good citizens, still there is a more restricted meaning in the phrase which directly concerns us as persons especially trained and legally qualified to provide medical care In passing, we point out that this dual responsibility has laid a peculiar burden upon physicians, who pay taxes for supporting welfare activities, and at the same time are called upon to give freely of their services to the medically indigent, usually with inadequate or no remuneration We are confident that the medical profession will never abandon that tradition, which is its proudest heritage, of rendering service to all who need it, regardless of economic reward, but we believe that this gift of charity is our personal and professional privilege and we insist that it must not be exploited by private or governmental agencies

The Committee feels that it is possible to offer a definition of "Adequate Medical Care" that is at once practical, comprehensive, and sufficiently elastic to meet varying conditions in different parts of our State. It has purposely been cast in a terse and succinct form, for convenience in use

The Committee begs to submit the following working definition

"Adequate Medical Care" means *"Sufficient competent professional service to maintain or restore good health, or to palliate incurable disease"*

This general definition, however, is qualified by the following specific definitions of each of the terms used

Sufficient Whatever diagnostic or therapeutic procedures, in the judgment of a competent physician (of the same or similar community) are necessary in a given case. It does not, for example, in every case contemplate the use of elaborate procedures such as complete Roentgen series, electrocardiograms, basal metabolism, or blood chemistry determinations It implies, however, the use of hospitals, consultative and laboratory facilities when necessary

Competent Possessing requisite training and acquired ability to use available general and medical knowledge according to ethical principles This implies constant effort on the part of the medical profession,

belief that Public Health officials should recognize the limitation of their field, and not seek to extend their activities to the curative treatment of the sick, in competition with their colleagues in private practice

It would be manifestly impossible, in the scope of this report, to include detailed recommendations for dealing with each problem of a State Health policy However, in the important fields of tuberculosis control and mental hygiene, comprehensive studies have been prepared by two members of our Committee, and will be presented later as supplementary reports A and B These we recommend to your earnest consideration as offering suggested models for dealing with specific issues

We have conceived our task to be rather to formulate a broad and fundamental policy to be followed in dealing with each problem, namely, that it is the duty and prerogative of physicians to provide competent professional service, properly controlled and disciplined by themselves, and not by laymen, nor by government bureaus or officials and that it is equally the prerogative and duty of properly qualified non-medical persons or agencies to provide the facilities and financial support for this competent medical care with strict adherence to the three requirements specified in this report

Respectfully submitted,
WALTER W MOTT, *Chairman*

REPORT OF FIRST DISTRICT BRANCH

To the House of Delegates, Gentlemen

It is with deepest regrets that we report the passing of our President, Dr W C Buntin, whose loss is keenly felt by the members of the First District Branch His energy and foresight contributed to the success of our 1937 Annual Meeting, his amiable personality made him a perfect host

Our future efforts will be greatly handicapped by his absence.

The 31st Annual Meeting of the First District Branch was held on October 5, 1937 at the Post-Graduate Hospital in New York City The sessions consisted of lectures, demonstrations, operative clinics in general surgery, orthopedic surgery, pediatrics, otolaryngology, ophthalmology, medicine, neurology, and psychiatry, gynecology, dermatology and syphilology, urology and traumatic surgery

After luncheon in the Nurses' Home, a general session was held at which Dr Willard C Rappleye, Director of the Post-Graduate Medical School and Dean of the College of Physicians of Columbia University, gave an address of welcome The State Society President, Dr Charles H Goodrich talked on Preventive Medicine

The keen interest shown by the membership in the previous annual meetings encouraged the officers to plan this meeting along the same general lines The management of the Post-Graduate Hospital very generously offered to us the use of their entire plant for the occasion The members of the staff arranged the very complete program of clinics, lectures, and demonstrations, which were well-attended throughout the day, and greatly appreciated

The success of our last two meetings demonstrates the fact that there is a definite place for the District Branch activity even here in the Metropolitan District, and that the meetings can well be clinical in character With this in mind, the officers are arranging for a similar session next Fall, and hope to carry on according to the high standards set by Dr Townsend and the late Dr Buntin

Respectfully submitted,
THEODORE WEST, *President*

April 1, 1938

modern medical practice If private citizens are unable, by reason of increasing tax burdens, to supply these, it may become necessary to provide them by government subsidy If this comes to pass, your Committee *recommends*

that the State Society exercise vigilance to see that the physical equipment only is subsidized, and that the personnel is not subject to government control or direction

Further, we believe it is the duty of the medical profession to examine with sympathetic interest and a spirit of mutual cooperation, any plan proposed by laymen to finance medical service expense, and to approve those which meet the following fundamental requirements

1 That they maintain or raise the standard of quality of medical care
2 That they provide a fair and reasonable remuneration on an ethical basis
3 That they do not involve, directly or indirectly, the interposition of a third party, as regards medical matters, between the patient and the physician of his choice

If we accept this clear-cut and fundamental distinction between the responsibilities of physician and public, we may apply the principle to the medical care of all the people of our state

Patients who are economically independent should finance their own medical bills, as at present The middle income class, who are independent as regards material needs, but to whom illness is often an unbudgetable and catastrophic calamity, might seek protection in group insurance for hospital expense, and in medical expense indemnity insurance for medical service To those in the lower brackets of this class, the gradient plan suggested by Dr Frederic E Elliott offers a means of assistance whereby these patients can be kept out of the wholly indigent class by supplementing from state or local funds the proportion of the total cost of medical service which they can afford to pay

III Responsibilities of governmental agencies

Medical care for the medically indigent, whether or not they are independent in other categories, should be paid for out of tax funds on a free-for-service basis Old-age relief and hospitalization should be included in this We believe that it is the function of State and local welfare authorities to provide material relief for indigents, and to certify as to the eligibility of indigents to receive medical care, but not to direct the provision of this care

We believe that it is then the duty of the State Medical Society to provide competent medical care to these certified indigents, care properly controlled and disciplined under machinery similar to the Workmen's Compensation Law provision, which has already demonstrated its ability to function satisfactorily It should be pointed out that if this plan be adopted, it will throw an increased burden of administrative detail on the Secretaries of County Societies This may be handled efficiently by those County Societies which have a well-organized executive office, but some means of relief must be adopted to aid the volunteer doctor-secretary of the other counties We *recommend*

That this difficulty be met by having the counties of a District Branch combine, when necessry, to engage the services of a paid Secretary for the group

We believe that the present cordial relations between the State Department of Health, the State Department of Social Welfare, and the State Medical Society should be fostered, that similar relations should be established with the Department of Mental Hygiene and that every effort should be made to integrate the work of our members with these agencies This may be done by encouraging our members to think and practice in terms of public health and preventive medicine

It is the opinion of the Committee that the average physician is still so occupied with the problems of curative practice that he lacks awareness of his responsibilities in the field of preventive medicine Our efforts in this direction would be materially aided if there could be developed a greater degree of cooperation on the part of Public Health officials generally, in enlisting the participation of private practitioners in preventive medical work At the same time, it may not be amiss to express our

REPORT OF FOURTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The Thirty-first Annual Meeting of the Fourth District Branch was held in the Queensbury Hotel, Glens Falls, October 1 and 2, 1937, the program consisting of the following papers

"The New Constitution and By-Laws of the Medical Society of the State of New York. Why the Changes and What We Should Gain Thereby" by Thomas H Cunningham, M D

"Treatment of Fractures of the Hip" by William D Johnson, M D

"The Future of the Albany Medical College" by Robert S Cunningham, M D

Address by Charles H Goodrich, M D, President of the Medical Society of the State of New York.

"The Art of Prestidigitation" by Gordon C Peck, M D

"The Use of Sulfanilamide in the Treatment of Infections of Childhood" by Benjamin W Carey, Jr, M D, Boston, Mass

"The Prevention of Heart Disease" by Paul Dudley White, M D, Boston, Mass

"A Survey of the Latest Thought in the Treatment of Cancer" by Frank E Adair, M D

The meeting was well attended, the papers were excellent, and the discussion was quite general

Respectfully submitted,

CARL R. COMSTOCK, *President*

April 1, 1938

REPORT OF FIFTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The regular Annual Meeting of the Fifth District Branch was held on September 23, 1937, in the Masonic Temple at Lowville The attendance was excellent, and the programs of the morning and afternoon sessions were divided by an excellent luncheon served in the Temple.

In the morning, Drs John C McClintock and George E Beilby discussed "The Problem of Simple Goiter" They covered the factors leading to development of simple goiter, and the symptoms presented by these young patients, and reviewed a series of cases They stated that the most important problem relating to simple goiter is treatment to relieve the symptoms and prevent future thyroid disease They considered careful and conservative observation as the keynote of success, and reviewed the methods of treatment accepted at the present time

Dr Charles H Baldwin read a paper on "Importance of Early Diagnosis in Affection of the Hip," with an excellent lantern slide demonstration In his opinion, early diagnosis of pathological processes occurring in and about the hip is always possible, and for the most part not difficult, and he stated that the number of cripples in this field still remains unnecessarily large.

Dr John A Kelly gave an excellent talk on the "Diagnosis, Treatment and End Results of Malignant Neoplasm of the Female Genital Tract"

At the afternoon session, the President of the State Society, Dr Charles H Goodrich, read a scholarly paper on the mental hygiene aspect of "Preventive Medicine" Dr Goodrich pointed out how very necessary it is for physicians in general to equip themselves much more fully than has been the case in the past with the psychiatric knowledge needed in everyday practice to manage personality difficulties that form a part of ordinary illness

"The Management of Peripheral Vascular Diseases" was very interestingly covered by Dr Herman E Pearse, who described the various newer laboratory methods, newer apparatus, and multiplicity of tests now available for diagnosis of these disturbances He evaluated these methods, expressing hope that simplification would be possible in the future in order that in everyday practice it should be possible to obtain all essential data with ordinary equipment

Dr Roscoe C Borst presented a paper on "The Management of Urinary Lithiasis," reviewing the recently accepted factors, that is, about etiology, the dietary regimes, urinary antiseptics, their values and dangers, and the need for cooperation of study of these cases by the bacteriologist, internist, physiological chemist, and the urologist.

REPORT OF SECOND DISTRICT BRANCH

To the House of Delegates, Gentlemen

The Second District Branch, comprised of the Medical Societies of the Counties of Suffolk, Nassau, Queens, and Kings, reports progress

During the current year I visited each of the component Medical Societies at a stated meeting I am pleased to report that each County Society continues to maintain its scientific meetings on a high plane and that there is an ever increasing interest on the part of the members for the welfare of their respective County Medical Society

The officers, chairman, and members of the various committees are, as usual, devoting a great deal of time and effort to public health and other matters which are of vital concern both to the public and the physician

The annual meeting of the Second District Branch was held at the Garden City Hotel, Nov 17, 1937 Over two hundred physicians attended the full day's session

A scientific exhibit was held in connection with the topics under discussion which were Cancer and Medical and Surgical Diseases of the Genito-Urinary Tract. A dinner dance in the evening completed the medical and social activities of the day

The Woman's Auxiliary of the four component Medical Societies in their usual gracious manner helped to make the annual meeting a success

Respectfully submitted,
IRVING GRAY, *President*

April 1, 1938

REPORT OF THIRD DISTRICT BRANCH

To the House of Delegates, Gentlemen

The Third District Branch, composed of the Counties of Albany, Columbia, Greene, Rensselaer, Schoharie, Sullivan, and Ulster, held its thirty-first annual meeting at Hotel Governor Clinton, Kingston, September 30, 1937 About 125 members were present besides several guests from neighboring medical districts

The morning session was opened by a hearty address of welcome by Dr Fred H Voss of Kingston, president of the Ulster County Medical Society This was followed by an instructive scientific program

Dr Louis C Kress of the State Institute for the Study of Malignant Disease, Buffalo, spoke of "Malignancy as Seen by the General Practitioner" A discussion followed led by Dr A M Dickinson of Albany The "Pathology of Vascular Diseases" was presented by Milton C Winternitz, M D, of Yale University School of Medicine, New Haven, Conn

At noon a lantern slide demonstration was given by Dr George F Cahill of New York City, presenting "Symptoms and Diagnosis of Renal Tumor"

The afternoon session opened with a brisk business meeting followed by a splendid address of welcome by Mayor C Heiselman of Kingston, and the introduction of guests

The first paper of the afternoon was given on "Preventive Medicine" by Charles H Goodrich, M D, President of the Medical Society of the State of New York Benjamin I Ashe, M D, of New York City spoke on "How to Analyze a Case of Bright's Disease." The session closed with a most instructive dialogue on "The Use of Protamine Zinc Insulin and Other Diabetic Problems", led by Dr Howard F Root of Boston, Mass, and Dr Stephen H Curtis of Troy

I wish to thank all the officers, committees, and members of the Third District Branch for their attendance and for their efforts to make this meeting a success I would especially thank the speakers who contributed so much, and the Ulster County Medical Society for their hospitality

Respectfully submitted
BERTRAN W GIFFORD, *President*

April 1, 1938

Election of officers resulted as follows *President,* Dr Alfred W Armstrong, *First Vice-President,* Dr Frederick W Lester, *Second Vice-President,* Dr Ben J Slater, *Secretary,* Dr John J Finigan, *Treasurer,* Dr Howard S Braisted

THOMAS W MALONEY, *President*

April 1, 1938

REPORT OF EIGHTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

A meeting of the officers of the Eighth District Branch Society was held at the Hotel Statler, Buffalo, May 1937 The officers of the District and Dr Joseph S Lawrence of Albany were present A discussion was held and suggestions were offered for the scientific program for the annual fall meeting We also discussed the advisability of changing the form of our program to give the members a more accurate idea of the scientific subjects to be discussed The new program form was adopted

The Thirty-second Annual Meeting of the Eighth District Branch Society was held at the Bartlett County Club, Olean, October 7, 1937 The meeting began at 10 00 A M with a paper by Dr Francis P Schwentker, Director of Medical Research, City Health Department, Baltimore, Maryland His paper gave us a complete orientation of the use of Sulfanilamide in the Treatment of Infections

The next paper was "Practical and Interesting Phases of Thoracic Surgery," by Cameron Haight, M.D, University of Michigan, Ann Arbor, Michigan

Dr Haight's paper was discussed by Dr Henry Kenwell and Dr Leon J Leahy

Dr Francis Goldsborough, Professor of Obstetrics, University of Buffalo, completed his resume on "Workings of Obstetrical Council of Erie County," the first part of which he gave the year before.

Luncheon was served at the country club at 12 30

Following luncheon a short business meeting and election of officers was conducted by the president. The following officers were elected for the ensuing two-year term

Louis L. Klostermyer, *President*	Warsaw
Leon J Leahy, *First Vice-President*	Buffalo
Robert C Peale, *Second Vice-President*	Olean
Peter J DiNatale, *Secretary*	Batavia
Fitch H VanOrsdale, *Treasurer*	Belmont

At 2 15 we were honored with the presence of the State Society President, Dr Charles H Goodrich, who gave use a brief talk on Preventive Medicine

The afternoon session opened with a paper by George W Cottis, M D The title of the paper was "The Private Practitioner and His Cancer Patient" The last paper of the afternoon was "Surgical Complications of Acute Communicable Diseases," by Francis J Gustina, M D, pediatrician, Buffalo City Hospital

The meeting was attended by ninety-two members of the District and six guests

The guests were Dr Charles H Goodrich, Brooklyn, Dr Cameron Haight, Ann Arbor, Mich, Dr Peter Irving, Secretary of the State Medical Society, New York, Dr L M Kysor, Hornell, Dr Joseph S Lawrence, Albany, and Dr Francis P Schwentker, Baltimore, Md

The members were very enthusiastic about the meeting and the scientific subjects discussed Favorable comments were heard on the new form of our printed program which gave a brief resume of each paper to be discussed I believe we have started something new in the interest of the members of our District by adopting this new type of program

The President of the District, after completing his work with the Executive Committee last year, has attended some County and Board of Censors meetings, reporting to his County Society and District the events of the past year

Respectfully submitted,

H W INGHAM, *President*

April 1, 1938

(See next page for Index to Annual Reports)

At the business section of the meeting, the following officers were elected for the coming two years

President, Charles A Earl	Oneida
1st Vice-President, Fred C Sabin	Little Falls
2nd Vice-President, Edward C Reifenstein, Sr	Syracuse
Secretary, William Hale, Jr	Utica
Treasurer, Dan Mellen	Rome

Respectfully submitted,

MURRAY M GARDNER, *President*

April 1, 1938

REPORT OF SIXTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The annual meeting of the Sixth District Branch was held in Oswego on September 21, 1937 The sessions were very well attended and the addresses evoked much interest

The morning session was held in the Westminister House of the Presbyterian Church and the first speaker was Dr Elliott T Bush whose subject was "Treatment of Vesicle Neck Obstruction and Prostatism" This was followed by a paper on "Tumors and Other Diseases of the Spinal Cord Amenable to Surgery" by Dr William P Van Wagenen Dr John S Lawrence discussed "Diagnosis and Practical Measures in the Treatment of Anemia"

Then followed a luncheon, which included the ladies, at the Green Lantern Country Club Immediately after this, the business was held at the Club and the following officers were elected for 1938 and 1939

Reeve B Howland, *President*	Elmira
George M Mackenzie, *First Vice-President*	Cooperstown
Norman S Moore, *Second Vice-President*	Ithaca
Hubert B Marvin, *Secretary*	Binghamton
William A Moulton, *Treasurer*	Candor

The afternoon session was opened by a talk on "Preventive Medicine" by the President of the State Society, Dr Charles H Goodrich Following this, Dr Irving S Wright spoke on "Some Newer Aspects of the Treatment of Peripheral Vascular Diseases," and Dr Anton W Sohrweide concluded the program with a paper on "Diagnosis and Management of Cutaneous Cancer"

Respectfully submitted,

LEO P LARKIN, *President*

April 1, 1938

REPORT OF SEVENTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

For the first time in this District, the annual meeting was held in conjunction with a special meeting of the Seventh District Dental Society of the State of New York on September 22 in the State Armory at Geneva

Attendance from the District was eighty-four, others 14, total 98

Scientific program convened at 10 00 A M Dr D A Haller read a paper on "Observations on Obesity" Discussion was by Dr Byron D Bowen Dr Edward S Rogers spoke on "Pneumonia Control," Discussion by Dr Edward G Whipple.

Dr Burton T Simpson presented "Newer Aspects of the Etiology of Cancer" and his associate Dr M L Levin opened the discussion At the conclusion of Dr Simpson's presentation Dr Levin demonstrated pathological specimens of various types of cancers A demonstration of cancer material suitable for the public was ready for exhibition but few showed enough interest to call at the exhibit space

Luncheon for the members of the medical and dental groups was served at Hotel Seneca

Visiting ladies were tendered a luncheon and card party at Belhurst-on-Seneca Lake

The afternoon session was opened by an address by Dr Charles H Goodrich, President of the Medical Society of the State of New York, who elected to talk on the subject "Medicodental Cooperation in Preventive Medicine" Theodor Blum, D D S, M D, spoke on "Medicodental Cooperation in Education" Dr Edwin I Harrington, President of the Dental Society of the State of New York closed the afternoon program with an address on "Medicodental Cooperation in Clinical Medicine"

MEDICAL SOCIETY OF THE STATE OF NEW YORK

ANNUAL MEETING, NEW YORK, MAY 9, 10, 11, 12, 1938

All meetings will be by Daylight Saving Time

House of Delegates

The regular Annual Meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10 00 A M on Monday, May 9, 1938, in the Ballroom of The Waldorf-Astoria Hotel

SAMUEL J KOPETZKY, M D, *Speaker*
PETER IRVING, M D, *Secretary*

Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held on Tuesday, May 10, 1938, at 7 00 P M, in the Ballroom of The Waldorf-Astoria Hotel

CHARLES H GOODRICH, M D, *President*
PETER IRVING, M D, *Secretary*

Registration

Registration will be held in the Hotel for Delegates on Monday, May 9, after 9 00 A.M, for Members on Monday, Tuesday, Wednesday, and Thursday, May 9, 10, 11, and 12, from 9 00 A M to 6·00 P M

Exhibits

Scientific and Technical Exhibits will be located in the Hotel

Scientific Sessions

General Sessions on Tuesday and Thursday afternoons Section meetings on Tuesday morning, Wednesday morning and afternoon, and Thursday morning, will be held in the Hotel

132nd Annual Meeting

The Waldorf-Astoria Hotel, Ballroom —Tuesday, May 10, 7 00 P M

Calling the Society to order by the President, Charles H Goodrich, M D

Reading of the minutes of the 131st Annual Meeting by the Secretary, Peter Irving, M D

The Annual Banquet

The Annual Banquet will be held in the Ballroom of the Hotel on Tuesday, May 10, at 7 00 P M The Guest Speakers will be announced later Following the banquet and speeches, there will be dancing in the Ballroom

Requests for tickets and reservations should be sent to Augustus Harris, M D, Chairman, Banquet Committee, 306 Park Place, Brooklyn, Telephone STerling 3-3131 Tickets will be $5 00

Delegates' Dinner

Dinner for the Delegates will be served in the Hotel on Monday following the adjournment of the afternoon session of the House of Delegates Tickets can be procured from the Secretary of the Medical Society of the State of New York, Peter Irving, M D, 2 E 103 St, New York Tickets will be $3 50

Public Meeting, Wednesday Evening, May 11

In the Ballroom will be held a meeting for the public at 8 30 P M on Wednesday, May 11, 1938 Cards of invitation (without cost) can be secured in advance by writing to Irving Gray, M D, Chairman, Public Meeting Committee, 41 Eastern Parkway, Brooklyn, Telephone STerling 3-0900, or they can be obtained at the Registration Desk in the Hotel

The Woman's Auxiliary

The headquarters will be in the Carpenter Suite, and the ladies are asked to register at the Registration Desk there after 9 00 A M Monday, May 9, 1938

Monday will be given over to meetings of the Executive Board (Carpenter Suite) and of the House of Delegates of the Auxiliary (Jansen Suite)

Dinner will be at 7 00 P M on Monday in Le Perroquet Suite Tickets for Auxiliary members, all doctors' wives and lay friends must be secured at the Registration Desk before 3·00 P M, Monday

A hobby show will begin on Monday and continue through the four days

Tuesday, May 10th—2 00 P M

1 "THE SIGNIFICANCE OF HOARSENESS"

Mr Victor E Negus, M S, F R C S, Surgeon for Diseases of the Throat and Ear, King's College Hospital, London, England (invited guest)

2 "THE RELATION OF DIABETES TO SURGERY"

Irvin Abell, M D, President-Elect American Medical Association, Louisville, Kentucky (invited guest)

3 "PREVENTION OF MATERNAL DEATHS"

Charles A Gordon, M D, Brooklyn

4 "VITAMINS AND THE CLINICIAN"

George R. Cowgill, Ph D, Laboratory of Physiological Chemistry, Yale University, New Haven, Connecticut (invited guest)

Thursday, May 12th—2 00 P M

1 "SOME OF THE NEWER SURGICAL ENTITIES OF THE LAST DECADE—THEIR DIAGNOSIS AND MANAGEMENT"

Frank H. Lahey, M D, Director of Surgery, Lahey Clinic, Boston, Massachusetts (invited guest)

2 "THE PHYSICIAN'S RESPONSIBILITY IN PREVENTIVE PROCTOLOGY"

Louis A Buie, M D, Chief of Department of Proctology, Mayo Clinic, Rochester, Minnesota (invited guest)

3 "THE IMPORTANCE OF PSYCHOLOGY IN THE PRACTICE OF MEDICINE."

Edward A. Strecker, M D, Professor of Psychiatry and Chairman of the Department of Psychiatry, School of Medicine, Univ of Pennsylvania, Philadelphia, Pennsylvania (invited guest)

4 "DIET AND DENTAL CARIES"

Russell W Bunting, D D S, Dean of The School of Dentistry, University of Michigan, Ann Arbor, Michigan (invited guest)

NOTE At the end of Doctor Bunting's paper there will be afforded an opportunity for questions in regard to his subject.

THE SECTIONS

[All papers read before the Society by members become the property of the Society The original copy of each paper shall be left with the Secretary of the Section Discussers should have their remarks typed and hand them to the Secretary Section meetings shall begin promptly at the hour specified]

At some period in the meetings, an executive session will be held for the purpose of electing officers for the ensuing year

SECTION ON MEDICINE

Chairman — Ralph H Boots, M D, New York
Secretary — Byron D Bowen, M D, Buffalo

Place of Meeting The Waldorf-Astoria, Sert Room

Tuesday, May 10th—10 00 A M

1 "SYSTEMIC MANIFESTATIONS OF LYMPHOGRANULOMA INGUINALE."

Alexander B Gutman, M D, *New York*

DISCUSSION Henry M Dawson, M.D, William Curth, M D, *New York*, Arthur W Grace, M D, *New York*, and Borris A. Kornblith, M D, *New York*

2 "MEASUREMENTS OF THE CIRCULATION IN CONSTRICTIVE PERICARDITIS BEFORE AND AFTER RESECTION OF THE PERICARDIUM"

Harold J Stewart, M D, *New York*, and George J Heuer, M D, *New York*

DISCUSSION Robert L Levy, M D, *New York*, and Richmond L. Moore, M D., *New York*

DISCUSSION Carl H Laws, M D, *Brooklyn*, and John L. Rice, M.D, *New York*

3 "THE TREATMENT OF MENINGITIS"

Josephine B Neal, M D, *New York*

DISCUSSION Emanuel Appelbaum, M D., *New York*, and Adolph G DeSanctis, M D, *New York*

4 "MALIGNANCIES IN INFANCY AND CHILDHOOD"

D William Scott, M D, *New York*

DISCUSSION Albert Preston Knight, M.D, *Waverly*, and Alfred F Hocker, M D, *New York*

Wednesday, May 11th—2 00 P M

1 "EPIDEMIC DIARRHEA OF THE NEW-BORN —A NEW DISEASE?"

Samuel Frant, M D, *New York*, and Harold Abramson, M D, *New York*

DISCUSSION William J Orr, M D, *Buffalo*, and Walter D Ludlum, M D, *Brooklyn*

2 "URINARY INFECTIONS IN INFANTS AND CHILDREN—A COMPARISON OF THERAPEUTIC METHODS"

Benjamin W Carey, Jr, M D, *Boston, Massachusetts* (invited guest)

DISCUSSION Meredith F Campbell, M D., *New York*, and Albert D Kaiser, M.D, *Rochester*

3 "THE PREVENTION OF PURULENT OTITIS MEDIA IN INFANTS"

Harry Bakwin, M D, *New York*

DISCUSSION John F Fairbairn, M D., *Buffalo*, and Sam Z Levine, M D, *New York*

4 "MONOCYTOSIS IN THE COURSE OF ACUTE LYMPHATIC LEUKEMIA—A CASE REPORT"

Hugh C Thompson, Jr, M D, *Albany*

DISCUSSION Brewster C. Doust, M D, *Syracuse*

SECTION ON DERMATOLOGY AND SYPHILOLOGY

Chairman — Leo Spiegel, M D, New York
Secretary — Mark Heiman, M D, Syracuse

Place of Meeting The Waldorf-Astoria, Assembly Rooms N, P, R

Tuesday, May 10th—10 00 A M

1 "TREATMENT OF DERMATOPHYTOSIS WITH VACCINES"

Jesse A Tolmach, M D, *New York*, and Eugene F Traub, M D, *New York*

DISCUSSION Samuel M Peck, M.D, *New York*

2 "IMPETIGO CONTAGIOSA COMPLICATED BY ACUTE NEPHRITIS."

Seymour H Silvers, M D, *Brooklyn*

DISCUSSION Louis J Frank, M D., *Brooklyn*

3 "THE PATCH TEST—AN EVALUATION OF ITS POSSIBLE DANGERS"

Paul E Bechet, M D, *New York*

DISCUSSION Marion B Sulzberger, M D, *New York*

4 "DIAGNOSTIC VALUE OF THE ITO TEST IN CHANCROIDAL INFECTIONS"

Harry C Saunders, M D, *New York*

DISCUSSION David Bloom, M.D, *New York*

Wednesday, May 11th—2 00 P M

Joint meeting with the Section on Public Health, Hygiene and Sanitation—The Waldorf-Astoria, Ballroom

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman — Burke Diefendorf, M D, Glens Falls
Vice-Chairman — Chalmer J Longstreet, M D, Binghamton
Secretary — Frank E. Coughlin, M D, Albany

Wednesday, May 11th—2 00 P M Joint Meeting with the Section on Dermatology and Syphilology—The Waldorf-Astoria, Ballroom

Thursday, May 12th—9 30 A M
Place of Meeting The Waldorf-Astoria, Assembly Room

1 "PNEUMONIA PREVENTION"

Wilson G Smillie, M D, *New York* (invited guest)

DISCUSSION Edward S Rogers, M D, *Albany*

2 "REPORT ON INFANT MORTALITY STUDY IN NORTHERN NEW YORK."

Stanley W Sayer, M D, *Gouverneur*

3 "Postpartum Pain"

Stuart B Blakely, M D, *Binghamton*

Discussion Irving W Potter, M D, *Buffalo,* and Francis R. Irving, M D, *Syracuse*

Thursday, May 12th—10 00 A M

1 "Normal Children Born of Women Suffering from Amenorrhea—Sterility Following Treatment by X-Ray"

Ira I Kaplan, M D, *New York*

Discussion Howard C Taylor, Jr, M D, *New York,* and Samuel A Wolfe, M D, *Brooklyn*

2 "Cesarean Section—Its Relation to Maternal Mortality"

Paul Titus, M D, *Pittsburgh, Pennsylvania* (invited guest)

Discussion Henricus J Stander, M.D, *New York*

3 "A Consideration of the Woman with Early Abortion Associated With Fever in Respect to Etiology, Bacteriology, Pathology and Treatment"

William E Studdiford, M D, *New York*

Discussion Harvey B Matthews, M.D, *Brooklyn,* and Thomas C. Peightal, M D, *New York*

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman — Charles A McKendree, M D, New York
Secretary — Paul H Garvey, M D, Rochester

Place of Meeting The Waldorf-Astoria, Assembly Rooms J, K, L, M

Wednesday, May 11th—10 00 A M

1 "Bromide Intoxication"

Albert G Odell, M D, *Clifton Springs*

Discussion Eugene N Boudreau, M D, *Syracuse,* and George Kirby Collier, M D, *Rochester*

2 "Tonics and Sedatives as Used in Neurological Practice."

Hubert S Howe, M D, *New York*

Discussion Harold T Hyman, M D, *New York*

3 "Endocrine Therapy in the Affective Psychoses"

Irving H Pardee, M D, *New York*

Discussion Clarence O Cheney, M D, *White Plains,* and Walter Timme, M D, *New York*

4 "The Role of Physical Measures in the Treatment of Neurological Conditions"

Richard Kovacs, M D, *New York*

Discussion Joseph E J King, M.D, *New York,* and John H Nolan, M D, *New York*

Thursday, May 12th—10 00 A M

1 "Care of the Chronically Ill from the Neurological Point of View"

Orman C Perkins, M D, *Brooklyn*

Discussion S Philip Goodhart, M D, *New York,* and Gerald C Parker, M D, *New York*

2 "Retrobulbar Neuritis in Disseminated Sclerosis

Wardner D Ayer, M D, *Syracuse*

Discussion Searle B Marlow, M D., *Syracuse,* and Leon H Cornwall, M D, *New York*

3 "Studies in Water Metabolism in Relation to the Nervous System"

Rowland T Bellows, M D, *Rochester*

Discussion William P Van Wagenen, M D, *Rochester,* and Leo Davidoff, M D, *Brooklyn*

4 "The Effects of Insulin, Metrazol, and Camphor on Brain Metabolism"

S Bernard Wortis, M D, *New York*

Discussion Foster Kennedy, M D, *New York,* and Nolan D C Lewis, M D, *New York* (invited guest)

SECTION ON PEDIATRICS

Chairman — John Dorsey Craig, M D, New York
Vice-Chairman — Paul W Beaven, M D, Rochester
Secretary — Norman L Hawkins, M D, Watertown

Place of Meeting The Waldorf-Astoria, Assembly Rooms J, K, L, M

Tuesday, May 10th—10 00 A M

1 "Unusual Clinical Pathological Observations in Cases of So-called Status Thymo-lymphaticus"

Tyree C Wyatt, M D, *Syracuse*

Discussion George R. Murphy, M D, *Elmira,* and Reginald A Higgons, M D., *Port Chester*

2 "The Stillbirth and Neonatal Death Problem"

Herbert C Soule, M D, *Rochester*

SECTION ON UROLOGY

Chairman — Albert M Crance, M D., Geneva
Vice-Chairman — Francis N Kimball, M D, New York
Secretary — John E Heslin, M D, Albany

Place of Meeting The Waldorf-Astoria, Jansen Suite

Tuesday, May 10th—10 00 A M

1 "Accessory Urethra"

Oswald Swinney Lowsley, M D, *New York*

Discussion General

2 "Industrial Epididymitis and Epididymo-Orchitis"

George E Slotkin, M D, *Buffalo*

Discussion Allan L Parlow, M D, *Rochester*, and William J Kennedy, M D, *Gloversville*

3 "The Diagnosis and Management of Subacute Blood Stream Infections of the Kidney"

Hugh Cabot, M D, *Rochester, Minnesota* (invited guest)

Discussion Leo E. Gibson, M D., *Syracuse*

Wednesday, May 11th—2 00 P M

1 "A Clinical Review of the Effects of Renal Sympathectomy on the Physiological Function of the Human Kidney"

J Sydney Ritter, M D, *New York*

Discussion Elmer Hess, M D, *Erie, Pennsylvania* (invited guest), and Clarence G Bandler, M D, *New York*

2 "Kidney Tumors—Some Causes of Poor End-Results"

E Ross Mintz, M D, *Boston, Massachusetts* (invited guest)

Discussion Frederick J Parmenter, M D, *Buffalo*, and Edward L Keyes, M D, *New York*

3 "Sulfanilamide in the Treatment of Urological Infections"

Terry M Townsend, M D, *New York*

Discussion James H. Borrell, M D, *Buffalo*, and Arthur H Paine, M D, *Rochester*

Thursday, May 12th—10 00 A M

A clinic in urological surgery will be held at the New York Hospital, to be conducted by Oswald S Lowsley, M D Tickets for admission to the clinic may be obtained from any of the officers of the section

SECTION ON RADIOLOGY

Chairman — Clifford R. Orr, M D, Buffalo
Vice-Chairman — William P Howard, M D, Albany
Secretary — Henry K. Taylor, M D, New York

Place of Meeting The Waldorf-Astoria, Jansen Suite

Wednesday, May 11th—10 00 A M

1 "Epithelioma of the Tonsil."

Walter L Mattick, M D, *Buffalo*

Discussion William Harris, M.D, *New York*, and James J Duffy, M D, *New York*

2 "A System of Radiation Therapy Based on the Half-Value Layer for the Determination and Selection of Ray Quality"

William H Meyer, M D, *New York*

Discussion Maurice Lenz, M D, *New York*, and A. Mutscheller, Physicist, *New York* (invited guest)

3 "Dosage in Radiation Therapy"

Edith H. Quimby, *New York* (invited guest)

Discussion Harriet C. McIntosh, M D, *New York*, and Carl B Braestrup, Physicist, *New York* (invited guest)

4 "Roentgen Therapy in Toxic Thyroid Disease"

Jacob R. Fried, M D, *New York*

Discussion Bertram Julian Sanger, M D, *New York*, and A. L Loomis Bell, M.D, *Brooklyn*

Thursday, May 12th—10 00 A.M

1 "Bone Tumors"

Louis C. Kress, M D, *Buffalo*

Discussion Samuel J Stabins, M.D, *Rochester*, and Bradley E Coley, M D, *New York*

2 "Carcinoma of the Cardia"

William H Stewart, M D, *New York*

Discussion John R. Carty, M D, *New York*, and Ross Golden, M D, *New York*

3 "Anatomico-Radiographic Studies of the Spine."

DISCUSSION Leo F Schiff, M D, *Plattsburg*

3 "CERTAIN ADMINISTRATIVE CONSIDERATION IN DISTRICT HEALTH WORK"

Harry S Mustard, M D, *Baltimore, Maryland* (invited guest)

DISCUSSION Margaret W Barnard, M D, *New York*

4 "DUST AND DISEASE."

Arthur J Vorwald, M D, *Saranac Lake* (invited guest)

DISCUSSION Homer Sampson, M D, *Saranac Lake* (invited guest)

JOINT MEETING

SECTION ON DERMATOLOGY AND SYPHILOLOGY

with the

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Place of Meeting The Waldorf-Astoria, Ballroom

Wednesday, May 11th—2 00 P M

1 "THE PROBABILITIES OF A DISASTROUS OUTCOME IN TREATED AND UNTREATED SYPHILIS"

Raymond A Vonderlehr, M D, *Washington, D C* (invited guest)

2 "THE SEROLOGIC LABORATORY AND THE PRACTITIONER IN THE SYPHILIS CONTROL CAMPAIGN"

Joseph Earle Moore, M D, *Baltimore, Maryland* (invited guest)

3 "SIGNIFICANCE OF ASYMPTOMATIC NEUROSYPHILIS"

Paul A O'Leary, M D, *Rochester, Minnesota* (invited guest)

4 "ADMINISTRATIVE AND EPIDEMIOLOGICAL ASPECTS OF SYPHILIS CONTROL."

Clealand A Sargent, M D, *Buffalo*

SECTION ON OPHTHALMOLOGY AND OTO-LARYNGOLOGY

Chairman Marvin F Jones, M D, New York
Secretary Algernon B Reese, M D, New York

Place of Meeting The Waldorf-Astoria, Le Perroquet Suite

Tuesday, May 10th—9 00 A M

Instruction Hour—9 00-10 00 A M

Tumors of the Eye and Adnexa.

Georgiana Theobald, M D, *Chicago, Illinois* (invited guest)

1 "COMPENSATION FOR EYE INJURIES—ITS PAST, PRESENT AND FUTURE IN NEW YORK STATE."

Albert C Snell, M D, *Rochester*

DISCUSSION D F Gillette, M D, *Syracuse*, Anton S, Schneider, M D, *Plattsburg*, and, Morris Davidson, M.D, *New York*

2 "THE TREATMENT OF TUMORS OF THE LIDS"

A By Radiation.
Hayes E Martin, M D, *New York*

B By Surgery
John M Wheeler, M D, *New York*

DISCUSSION Arthur J Bedell, M D, *Albany*, Walter S Atkinson, M D, *Watertown*, and, Ralph I Lloyd, M D, *Brooklyn*

Wednesday, May 11th—2 00 P M

1 "OTOGENOUS NON-SUPPURATIVE ENCEPHALITIS AS A CLINICAL ENTITY"

E Miles Atkinson, M D, *New York*

DISCUSSION Albert B Siewers, M D, *Syracuse*

2 "THE DIFFERENTIAL DIAGNOSIS OF LARYNGEAL CARCINOMA"

Mr Victor E Negus, M S, F R C S, *London, England* (invited guest)

3 "TREATMENT OF OTITIC MENINGITIS"

Daniel S Cunning, M D, *New York*

DISCUSSION D'Arcy McGregor, M D, *Buffalo*, and James M Dunn, M D, *Schenectady*

Paul C Colonna, M D, *Oklahoma City, Oklahoma* (invited guest)

Discussion Armitage Whitman, M D., *New York*, and John C McCauley, Jr, M.D, *New York*

SECTION ON PATHOLOGY AND CLINICAL PATHOLOGY

Chairman — James Ewing, M D, New York
Vice-Chairman — N Chandler Foot, M D, New York
Secretary — M J Fein, M D, Brooklyn

Place of Meeting The Waldorf-Astoria, Le Perroquet Suite

Wednesday, May 11th—10 00 A M

1 Opening Address

James Ewing, M D, *New York*

2 "Tumors of the Mediastinum"

N Chandler Foot, M D, *New York*

Discussion James Ewing, M D *New York*, and A. Purdy Stout, M D., *New York*

3 "The Serodiagnosis of Infectious Disease."

Augustus B Wadsworth, M D, *Albany*

Discussion C. Zent Garber, M D., *New York* (invited guest), and Carl Lange, M.D., *Albany* (invited guest)

4 "Therapeutic Uses of Bacteriophages, Particularly in Sepsis"

Ward J MacNeal, M D, *New York*

Discussion Morris L. Rakieten, M D., *Brooklyn*, and Josephine B Neal, M D, *New York*

Thursday, May 12th—10 00 A.M

1 "The Clinical and Pathological Significance of Solid Tumors of the Ovary"

Walter Schiller, M D, *Chicago, Illinois*, (invited guest).

Discussion Alfred Plaut, M D, *New York*

2 "Relationship of Adenomatous Polypi and Carcinoma of the Colon"

Paul Klemperer, M D, *New York*

Discussion Sylvan D Manheim, M D, *New York*, and N Chandler Foot, M D., *New York*

3 "Malignant Manifestations of Bowen's Disease and Bowenoid Lesions"

A. Purdy Stout, M D, *New York*

Discussion Gerald F Machacek, M D., *Long Island City*

4 "Architectural Patterns in the Kidney of Chronic Bright's Disease"

Jean Oliver, M D, *New Jersey* (invited guest)

Discussion Paul Klemperer, M D, *New York*

SESSION ON PHYSICAL THERAPY

Chairman — Madge C. L McGuinness, M D, New York
Secretary — Harold J Harris, M D, Westport

Place of Meeting The Waldorf -Astoria, Assembly Rooms N, P, R

Wednesday, May 11th—10 00 A M

1 "Physical Therapy in Smaller Hospitals"

Joseph A E Syracuse, M D, *Buffalo*

Discussion Jerome Weiss, M D., *Blooklyn*

2. "The Circulation of the Joints of Chronic Arthritis"

John W Ghormley, M D, *Albany*

Discussion Edward F Hartung, M D, *New York*

3 "Prognosis in Peripheral Vascular Disease and Indications for Treatment"

William S Collens, M D, *Brooklyn*, and Nathan D Wilensky, M.D, *Brooklyn*

Discussion Karl Harpuder, M.D, *New York*

4 "Short Wave Diathermy—Clinical Application and Technic."

John S Coulter, M D, *Chicago, Illinois* (invited guest)

Discussion Gustav Bucky, M.D, *New York*

5 "Radio Interference by Electrical Equipment Used by Physicians and Surgeons, and Means of Eliminating It"

Horatio B Williams, M D, *New York*

Discussion Myron Schwartzchild, Physicist, *New York* (invited guest)

Lee A Hadley, M D, *Syracuse.*

DISCUSSION William Harris vonLackum, M.D., *New York,* and James P Cole, M D., *Buffalo*

4 "INTUSSUSCEPTION"

Emanuel Mendelson, M D, *Brooklyn.*

DISCUSSION W E. Howes, M D, *Brooklyn,* and Bernard Ehrenpreis, M.D, *Brooklyn*

SECTION ON INDUSTRIAL MEDICINE AND SURGERY

Chairman . William A. Sawyer, M.D, Rochester
Secretary .. .. Dan Mellen, M D, Rome

Place of Meeting The Waldorf-Astoria, Blue Room

Wednesday, May 11th—10 00 A M

1 "THE EFFECTS OF BREATHING THE PRODUCTS OF COMBUSTION FROM THE ELECTRIC ARC"

Philip Drinker, M D, *Boston, Massachusetts* (invited guest)

2 "NECESSARY STANDARDS IN OCCUPATIONAL DISEASE CONTROL"

James H Sterner, M D, *Rochester*

3 "NEWER CONCEPTS IN THE TREATMENT OF ACUTE LEAD POISONING"

Irving Gray, M D, *Brooklyn.*

Thursday, May 12th—10 00 A M

1 "INFLUENCE OF INDUSTRIAL MEDICAL WORK ON GENERAL HEALTH AND MEDICAL SCIENCE."

R. R Sayers, M D, *Washington, D C* (invited guest)

2 "THE RELATIONSHIP OF A TRIVIAL INJURY TO THE ALLEGED AGGRAVATION OF A CONSTITUTIONAL AILMENT"

John J Moorhead, M D, *New York*

3 "FATIGUE IN INDUSTRY"

Foster Kennedy, M D, *New York*

4 "RELATIONSHIP OF INDUSTRIAL MEDICINE TO PRIVATE PRACTICE"

Clarence D Selby, M D, *Detroit, Michigan* (invited guest)

SECTION ON ORTHOPEDIC SURGERY

Chairman Samuel Kleinberg, M D, *New York*
Secretary Arthur Krida, M D, New York

Place of Meeting The Waldorf-Astoria, Blue Room

Tuesday, May 10th—10 00 A M

1 "ACUTE OSTEOMYELITIS"

Carl T Harris, M D, *Rochester*

2 "THE RATIONALE AND RESULTS OF MAGGOT THERAPY IN CHRONIC OSTEOMYELITIS"

Joseph Buchman, M D, *New York*

DISCUSSION Fred H Albee, M.D., *New York,* Isadore Zadek, M.D., *New York,* and Maurice M Pomeranz, M D., *New York*

3 "COMPRESSION FRACTURES OF THE SPINE."

M Beckett Howorth, M D, *New York*

DISCUSSION Clay Ray Murray, M D, *New York,* and Wm H. Watters, M.D., *New York*

4 "RESTORATION OF MUSCLE BALANCE IN THE TREATMENT OF OBSTETRICAL PARALYSIS"

Joseph B L'Episcopo, M D., *Brooklyn*

DISCUSSION Leo Mayer, M.D, *New York,* and Joseph E. Milgram, M D, *Brooklyn*

Wednesday, May 11th—2 00 P M

1 "SURGERY IN SPASTIC PARALYSIS."

Fremont A Chandler, M.D, *Chicago, Illinois* (invited guest).

DISCUSSION Mather Cleveland, M.D., *New York,* and Lewis Clark Wagner, M.D., *New York*

2 "TREATMENT OF FRACTURES OF BOTH BONES OF THE FOREARM IN THE LOWER FIFTH"

Donald E McKenna, M D, *Brooklyn*

DISCUSSION Philip D Wilson, M D, *New York,* and Herbert C. Fett, M D, *Brooklyn*

3 "TUBERCULOSIS OF THE TENDONS AND TENDON SHEATHS"

Frank N Potts, M D, *Buffalo*

DISCUSSION Richard S Farr, M D., *Syracuse,* and Alan DeF Smith, M D., *New York*

4 "A RECONSTRUCTION OPERATION FOR OLD UN-UNITED FRACTURES OF THE FEMORAL NECK"

Space A-5

Frank E Adair, M D, Memorial Hospital, New York

CARCINOMA OF THE BREAST

Description Breast tumors Photographs showing different pathological types and specimens of breast tumors Charts showing symptoms and signs

Space A-6

William P Healy, M D, Memorial Hospital, New York

GYNECOLOGICAL CARCINOMA

Description Carcinoma of corpus uteri and cervix uteri Photographs, clinical histories and end results

Space A-7

Hayes E Martin, M D, Memorial Hospital, New York

CARCINOMA OF THE HEAD AND NECK

Description Intraoral Cancer Various types showing before and after treatment

Space A-8

William I Watson, M D, Memorial Hospital, New York

CARCINOMA OF THE ESOPHAGUS

Description Photographs showing diagnosis and treatment.

Space A-9

George E Binkley, M D, Memorial Hospital, New York

TUMORS OF THE RECTUM

Description Exhibit consists of photographs of gross tumors and microscopic sections of various types of tumors Metastatic lesions to various parts of the body Treatment, radiation therapy consisting of external applications of roentgen and radium rays, interstitial applications of gold-filtered radon seeds Special surface rectal applicators Snare removal and fulguration of rectal polyps Surgery illustrating different forms of technic for radical removal of colon and rectal cancer Small number of gross specimens and wax models

Space A-10

S L Cash, M D, Department of Gastroenterology, New York Polyclinic Medical School and Hospital, New York

A DIRECT METHOD OF DIAGNOSIS AND TREATMENT OF PEPTIC ULCER

Description The exhibit consists of x-ray films of the stomach, photographs of x-ray films and of exudate from ulcers Also of test braids and tubes and a card giving a brief resume of the procedure.

Space A-11

Charles Murray Gratz, M D, New York Post-Graduate Medical School and Hospital—Columbia University, and City Hospital, New York

FASCIAL ADHESIONS IN LOW BACK PAIN

Description Fascial adhesions shown anatomically, radiologically and histologically, rational of selecting cases in which fascial adhesions should be treated, result of treating fascial adhesions over a period of three years with reports, a new method of measuring limitation of motion of the back

The motion picture in connection with this exhibit will be shown in the Scientific Motion Picture Exhibit as follows *"Fascial Surgery,"* Tuesday evening, 7 00 P M, and Wednesday morning, 9 00 A M

Space A-12

Kanematsu Suigiura, M D, Memorial Hospital, New York

TRANSPLANT OF ANIMAL TUMORS

Description Evidence of direct and indirect actions of radiation on the malignant cells

Space A-13

Jerome M Lynch, M D, and G Johnson Hamilton, M D, The Lynch Clinic, New York Polyclinic Medical School and Hospital, New York

CARCINOMA OF THE CAUDAL BOWEL

Description The operative technics used in the eradication of this pathology are illustrated by drawings Lynch's "Simplification of the Perineal Excision of the Rectum" is shown by an animated film The lymphatic spread in cancer of the rectum is depicted diagrammatically and its relation to the operative technic explained Microphotographs of the various stages of cancer in the caudal bowel will be shown and the Duke's method of grading will be demonstrated

The motion picture in connection with this exhibit will be shown in the Scientific Motion Picture Exhibit as follows *"Ex-*

SESSION ON REGIONAL AND GENERAL ANESTHESIA

Chairman — Robert B Hammond, M D, White Plains
Secretary — S LeRoy Sahler, M D, Rochester

Place of Meeting The Waldorf-Astoria, Assembly Room

Wednesday, May 11th—2 00 P M

1 "CYCLOPROPANE ANESTHESIA IN THORACIC SURGERY"

Pol N Coryllos, M D, *New York*

DISCUSSION F A D Alexander, M D, *Albany*, and Frank B Berry, M D, *New York*

2 "ANESTHESIA PROBLEMS IN SMALL COMMUNITIES"

Charles J Wells, M D, *Syracuse*

DISCUSSION Maurice A Barnard, M.D., *Rochester*

3 "CERVICAL PLEXUS BLOCK."

Hippolyte M Wertheim, M D, *New York*, and Emery A Rovenstine, M D, *New York*

DISCUSSION J A Kalb, M D, *Endicott*

4 "OXYGEN THERAPY"

John H Evans, M D, *Buffalo*

DISCUSSION Alvan L Barach, M D, *New York*

Scientific Exhibits

WALDORF-ASTORIA HOTEL, MAY 9–12

Space A-1

Tibor de Cholnoky, M D, New York Post-Graduate Medical School and Hospital—Columbia University, New York

ELECTROSURGERY FOR ADVANCED CARCINOMA

Description The results of electrosurgery in advanced carcinoma of the head, neck, chest, breast, rectum, etc Demonstration of plastic reconstruction showing the results of one to five years arrest

The motion pictures in connection with this exhibit will be shown in the Scientific Motion Picture Exhibit as follows *"Advanced Carcinoma of the Ear with Plastic Repair" and "Recurrent Carcinoma of the Rectum"* Monday afternoon, 2 15 P M, and Wednesday afternoon, 2 00 P M

Space A-2

I Seth Hirsch, M D, College of Medicine New York University and Beth Israel Hospital, New York

THE APPLICATION OF ROENTGENKYMOGRAPHY TO DIAGNOSIS

Description The exhibit will illustrate by Roentgenkymograms and diagrams the application of this method of graphically recording visceral movement, in the diagnosis of diseases of the heart, lungs, diaphragm, and the gastro-intestinal tract.

Space A-3

Adolph G DeSanctis, M D, Department of Pediatrics, New York Post-Graduate Medical School and Hospital—Columbia University, New York

MALIGNANT NEOPLASMS IN CHILDREN

Description A survey of all cases of malignant neoplasms in children over a period of ten years Pathological specimens, both macroscopic and microscopic, statistical charts and models will be demonstrated

Space A-4

Benjamin S Barringer, M D, and **Archie L Dean, M D**, Memorial Hospital, New York

GENITOURINARY CARCINOMA

Description Tumors of the kidney, bladder and epithelioma of scrotum Photographs, various forms of radiation treatment, specimens, tables of five years survivals

Letter designations of spaces are as follows
A—refers to Second floor foyer
B—First balcony south side Ballroom
C—Second balcony, south side Ballroom
Motion pictures are shown in the Empire Room

Space A-21

John E Jennings, M D, W. E. Howes, M D, Herman Bolker, M D, Siegfried W Westing, M D, and Staff, Brooklyn Cancer Institute, Brooklyn, New York.

BRONCHIAL CARCINOMA.

Description Presentation of a group of cases, synopsis of history with x-rays of lesions and metastases, pathological specimens, gross and microscopic, illustration of surgical and radiological treatment.

Space A-22

Department of Pathology and Bacteriology in collaboration with the Surgical Service of Chas Gordon Heyd, M D., New York Post-Graduate Medical School and Hospital—Columbia University, New York

(1) 10,000 OPERATIONS TABULATED AND SOME UNUSUAL EXAMPLES FEATURED (2) MISCELLANEOUS SPECIMENS (3) BACTERIOPHAGES AND THEIR THERAPEUTIC USES

Description Pathological material obtained from 10,000 consecutive operations at the New York Post-Graduate Hospital, are summarized and certain basic facts revealed. Presentation of the therapeutic use of bacteriophages

Space A-23

Anna Samuelson, M D, Cardiac Clinic and Departments of Medicine and Laboratories, Morrisania City Hospital, New York

PANCREATIC TISSUE EXTRACT IN CARDIOVASCULAR ARTERIOSCLEROSIS

Description Chemical, Biochemical, clinical and experimental studies in the human and rabbit

Space A-24

Asta J Wittner, M D, and Sophie Spitz, M D, Departments of Surgery and Pathology, New York Infirmary for Women and Children, New York

VALUE OF THE ENDOMETRIAL BIOPSY AS AN ADJUNCT TO A DIAGNOSTIC CURETTAGE.

Description A series of fifty microphotographs of endometrial biopsies followed at regular intervals, in contrast to a single diagnostic curettage from a series of fifty cases

Space B-25

R Franklin Carter, M D, F. Howard Westcott, M D, Fred W. Graef, M D, and James F Henegan, D D S, Medical Department of the New York Times, New York

TEN YEAR MEDICAL SURVEY, THE NEW YORK TIMES

Description Charts, graphs, and tables describing the frequency of various diseases and relative costs

Space B-26

A Charles Posner, M D, Department of Obstetrics, Harlem Hospital, New York

PUERPERAL MORBIDITIES

Description The routes and pathological processes involved in puerperal infections with original drawings, charts, and outline of treatment—from the Obstetrical Service of Harlem Hospital

Space B-27

Joseph A Hyams, M D, Department of Urology, New York Post-Graduate Medical School and Hospital—Columbia University, New York

SURGICAL DISORDERS OF THE UPPER URINARY TRACT

Description The surgical pathology of the kidney and ureter, illustrated by Roentgenographic studies and colored transparencies of operative specimens

Space B-28

Frederich W Williams, M D, Morrisania City Hospital, New York

GUIDE FOR SURGERY IN LOWER EXTREMITY LESIONS IN DIABETICS

Description Charts, diagrams, photos and case histories demonstrating the classification, the criteria, diagnosis (without instruments), and the value to the surgeon in determining the level and procedure to be done.

Space B-29

John S Coulter, M D, and Herman Chor, M D, Northwestern University Medical School, Chicago, Illinois

EFFECTS OF ELECTRICAL MUSCLE AND NERVE STIMULATION

Description Charts, photographs and histologic specimens of damaged monkey

cision of the Rectum for Carcinoma—Lynch's Simplification," Monday afternoon, 2 35 P M, and Wednesday afternoon, 4 17 P M

Space A-14

Ralph E Herendeen, M D, Memorial Hospital, New York

BONE TUMORS AND THEIR TREATMENT WITH X-RAY

Description Effect of x-ray treatment on bone tumors

Space A-15

Samuel George Schenck, M D, Jewish Hospital of Brooklyn, Brooklyn

CONGENITAL CYSTIC DISEASE OF THE LUNG

Description Fifteen cases of congenital cystic disease of the lung are shown and described, particularly their roentgenological features Wherever available, the pathologic specimen and microphotographs are exhibited. A classification of congenital cystic disease of the lung is given In conjunction with 380 cases found in the literature, the patients are grouped together according to their age and type of cyst found Charts showing sex, symptoms, cause of death, and other characteristics are displayed Much of the data including the classification and tables are reproduced in mimeographed copies to be distributed to those interested.

Space A-16

Seymour F Wilhelm, M D, Beth Israel Hospital, New York.

VASO-SEMINAL VESICULOGRAPHY

Description The exhibit consists of roentgenograms made following the injection of iodized oil into the vasa deferentia Studies are shown of normal and diseased seminal vesicles, as well as observations on the physiology of the seminiferous tract.

Space A-17

Louis C Kress, M D, Division of Cancer Control, State Department of Health—State Institute for the Study of Malignant Disease, Buffalo

CANCER.

Description The exhibit consists of transparencies portraying cancer in different parts of the body before and after treatment, types of treatment, photomicrographs and end-results Wax models show in realistic manner cancer in various parts of the body

Space A-18

Mather Cleveland, M D, and **David M Bosworth, M D**, Sea View Hospital, New York

TUBERCULOSIS OF BONES AND JOINTS—DIAGNOSIS AND COMPLICATIONS

Description X-ray transparencies, photographs, photomicrographs, pathological specimens with photoenlargements are demonstrated. A moving picture in color showing lesions of various parts in different stages, with and without complicating factors, and cases rehabilitated following operation to demonstrate final result of joint fusions, will be shown in the Scientific Motion Picture Exhibit, as follows *"Tuberculosis of Bones and Joints—Diagnosis — Complications — Rehabilitation,"* Tuesday afternoon, 2 00 P M, Thursday evening, 7 00 P M

Space A-19

S F Weitzner, M D, X-ray Department, Morrisania City Hospital, New York.

LATERAL ROENTGEN PELVIMETRY

Description X-ray films will demonstrate the method and its practical application

Space A-20

William Z Fradkin, M D, Jewish Hospital of Brooklyn, New York

COLITIS AND THE DIARRHEAS

Description (1) Apparatus used at the bedside. (2) Pathological specimens (3) Instructive x-ray plates (4) Classification of colitis and the diarrheas (5) Charts and models illustrating the aspiration of exudate from lesions in the sigmoid and rectum (6) Chart of bacteriologic and serologic findings in 200 cases of colitis and diarrhea (7) Value of blood agglutination tests (8) Local therapy in colitis and the diarrheas (9) A motion picture on this subject will be exhibited in the Scientific Motion Picture Exhibit, as follows *"Colitis and the Diarrheas,"* Monday afternoon, 4 30 P M, and Wednesday afternoon, 2.20 P M

THE PROGRESSION OF DEFORMITIES IN ARTHRITIS

Description Photographs of a normal individual, posed in various stages of deformity, imitating the manner in which a mild, simple arthritic deformity progresses to a serious, complex one Comparison is made with photographs of actual arthritic patients, demonstrating the essential points of the exhibit.

Space B-37

Theodore Neustaedter, M D, The Endocrine Clinic and Laboratory, Department of Gynecology, New York Post-Graduate Medical School and Hospital—Columbia University, New York

ENDOMETRIAL EXAMINATION BY THE BIOPSY METHOD

Description The exhibit consists of photomicrographs of endometrial specimens obtained by biopsy One group of photographs picture the various changes in the endometrium during a normal menstrual cycle, a second group illustrates the abnormal changes which occur in the various menstrual endocrinopathies, a third group illustrates changes in human castrate endometrium produced by organotherapy

Space C-38

Edward F Hartung, M D, John D Currence, M D, and Miss Margaret Straub Neil, New York Post-Graduate Medical School and Hospital—Columbia University, New York

SOCIAL ASPECTS OF CHRONIC RHEUMATISM

Description This exhibit demonstrates the incidence, the economic loss, the importance of early treatment, the great number of patients not under medical supervision, the lack of hospital facilities for this disease, and what can be done with proper facilities

Space C-39

William H Meyer, M D, Department of Radiology, New York Post-Graduate Medical School and Hospital—Columbia University, New York

A SYSTEM OF RADIATION THERAPY

Description The selection of the proper ray quality for each type and location of lesion is as important as the "r" dose intensity In the treatment of lesions at various depths, the selection of ray quality should be such that the greatest absorption occurs at the site of the lesion It is equally important to avoid such overdosage that damage of the deeper lying tissues might result

It is well to remember that the "r" dose is a physical measure and varies not only by change of ray quality, but markedly so by variations in the size of the portal, the intensity of dose administration, as well as the rhythm of dose application

Space C-40

Ruth Morris Bakwin, M D., and Harry Bakwin, M D, New York University — Bellevue Hospital, and New York Infirmary for Women and Children, New York

GROWTH STUDIES IN HEALTH AND DISEASE.

Description Charts showing growth in normal children and children with various diseases—intestinal intoxication, eczema, rheumatic heart disease.

Space C-41

Elaine P Ralli, M D, and Harold Brandalene, M D, College of Medicine New York University, Department of Medicine, and Third Medical Division of Bellevue Hospital, New York

THE EFFECT OF APPLICATION OF COD LIVER OIL ON FOOT ULCERS IN DIABETIC PATIENTS

Description Photographs of ulcers of the feet in patients with diabetes mellitus before and after the application of cod liver oil Twenty-one patients were treated in this manner, and eleven controls were observed.

Space C-42

Harry C W S de Brun, M D, New York Polyclinic Medical School and Hospital, New York

THE TREATMENT OF FRACTURES OF THE METACARPAL BONES

Description Two charts illustrating the deformity, reduction, and immobilization of metacarpal fractures A simple moulded plaster splint with wire tractor illustrated Open reduction illustrated Splints exhibited.

tissues caused by severed nerves, demonstrating the effects of electrical muscle and nerve stimulation, versus massage and active motion

Space B-30

Gustave Aufricht, M D, Department of Plastic Surgery, New York Post-Graduate Medical School and Hospital—Columbia University, New York

PLASTIC AND RECONSTRUCTIVE SURGERY

Description Exhibit of moulages and photographs of patients, also diagrams illustrating surgical procedures

The motion pictures in connection with this exhibit will be shown in the Scientific Motion Picture Exhibit as follows *"Reconstruction of the Face and Neck,"* Tuesday morning, 9 30 A M, *"Combined Plastic Operation for Prominent Nose and Receding Chin,"* Tuesday afternoon, 5 16 P M, and Thursday morning, 10 10 A M, *"Mammaplastic Operation,"* Tuesday evening, 8 16 P M *"Construction of New Era for Congenital Absence,"* Monday afternoon, 4 47 P M, and Wednesday afternoon, 3 37 P M, *"Correction of Saddle Nose by Use of Nasal Tissue Only,"* Monday morning, 9 00 A M

Space B-31

John S Labate, M D, College of Medicine, New York University, and Obstetrical and Gynecological Service, Bellevue Hospital, New York

THE ANATOMY OF THE ABDOMINAL AND PELVIC SYMPATHETIC NERVOUS SYSTEM

Description Casts of human dissections in adults and infants showing the main abdominal and pelvic sympathetic plexi Special attention is given to the superior hypogastric plexus (presacral nerve) Drawings of the dissections will also be exhibited

Space B-32

Edward Levy, M D, Anatomic Laboratory, College of Medicine, New York University, New York

FUNDAMENTALS IN PROCTOLOGY

Description Sections of pelves male, female—newborn and adult Dissections of perineum—male, female, anatomic spaces of surgical interest shown by diagram, photograph and specimen Pelvic nervous system

Space B-33

Jacob Sarnoff, M D, Israel Zion Hospital, New York

PLASTIC SURGERY

Description The exhibit consists of life size models of the before and after of plastic surgery, with transparencies and diagrams of plastic operations of the nose, ears, face, breasts and deforming scars

The motion pictures in connection with this exhibit will be shown in the Scientific Motion Picture Exhibit as follows *"Nasal Plastic,"* Monday afternoon, 2 00 P M, and Tuesday morning, 10 45 A M, *"Breast Plastic,"* Monday evening, 7 45 P M, and Wednesday afternoon, 4 27 P M, *"Disease of the Breast,"* Tuesday morning, 9 00 A M, and Thursday afternoon, 2 00 P M, *"Uterine Fibroids,"* Tuesday morning, 9 15 A M, and Thursday morning, 9 55 A M, *"Lorek Orchidopexy,"* Tuesday afternoon, 5 01 P M, and Thursday afternoon, 2 15 P M, *"Intussusception and Bobby Pin in Duodenum,"* Tuesday afternoon, 3 46 P M, and Thursday morning, 9 40 A M

Space B-34

J K Cline, M D, and Norman Jolliffe, M D, Department of Medicine, College of Medicine New York University, the Psychiatric Medical Service of the Third Medical Division of Bellevue Hospital, and the Merck Research Institute, New York

CHEMICAL AND CLINICAL STUDIES OF VITAMIN B_1

Description A demonstration of a chemical method for the determination of Vitamin B_1 in the urine, charts showing variations in the daily urinary output, correlated with the dietary intake of Vitamin B_1

Space B-35

Hermann Fischer, M D, Lenox Hill Hospital, New York

MODELS OF PATHOLOGICAL SPECIMENS

Description Models of pathological specimens made by Dr Fischer for the Educational Department of Lenox Hill Hospital

Space B-36

John P Stump, M D, Orthopedic and Arthritis Clinics, New York Post-Graduate Medical School and Hospital—Columbia University, New York

Description Methods employed by the Laboratory of the State Department of Health for diagnosis of venereal diseases and of enteric infections

* * *

The following exhibits consist of motion pictures only These will be shown in the Scientific Motion Picture Exhibit. Refer to motion picture schedule

Exhibit 53

Herbert C Chase, M D, New York Polyclinic Medical School and Hospital, New York

CARCINOMA OF THE BREAST

Description A postgraduate teaching sound film in color covering the incidents, diagnosis, deferential classification, and pathology of carcinoma of the breast. The evolution of the radical operation from the time of Hippocrates and the present day radical operation is depicted.

The film will be shown in the Scientific Motion Picture Exhibit as follows Monday evening, 8 00 P M , Wednesday morning, 10 20 A M , Thursday afternoon, 4 55 P M

Exhibit 54

Samuel L Siegler, M D, Brooklyn Women's Hospital, Brooklyn, N Y

STERILITY—ITS CAUSES, INVESTIGATION, AND TREATMENT

Description A motion picture in color portraying the subject matter by means of legends, animation, drawings, and x-ray Both the male and female factors are included

The film will be shown in the Scientific Motion Picture Exhibit as follows Monday morning, 10 00 A M , Wednesday afternoon, 5 02 P M , Thursday afternoon, 3 55 P M

Exhibit 55

H Harold Gelfand, M D, Gouverneur Hospital, New York

CLINICAL MANIFESTATIONS OF ALLERGY

Description Pollen Allergy, botanical, clinical Diagnosis and treatment.

The film will be shown in the Scientific Motion Picture Exhibit as follows Monday afternoon, 3 30 P M , and Wednesday afternoon, 2 37 P M

Space AA

New York and Brooklyn Regional Fracture Committee, New York

PRESENT DAY METHODS OF FRACTURE TREATMENT

Description Wall posters and transparencies demonstration of traction-suspension apparatus, and methods of transportation of spine and extremity fractures

SCIENTIFIC MOTION PICTURE EXHIBIT

WALDORF-ASTORIA HOTEL, MAY 9–12

Place of Showing Empire Room

MONDAY MORNING

9 00 A M Correction of Saddle Nose by Use of Nasal Tissues Only
9 30 A M Varicose Veins
9 45 A M Serial Uterosalpingography
10 00 A M Sterility Its Causes, Investigation and Treatment.
11 00 A M Standard Obstetrical Routine.
12 10 P M Treatment of Asphyxia Neonatorum.
12 30 P M Care of the Premature Infant.
12 55 P M Morning show terminates

MONDAY AFTERNOON

2 00 P M Nasal Plastic.
2 15 P M Advanced Carcinoma of the Ear with Plastic Repair
2 25 P M Recurrent Carcinoma of the Rectum
2 35 P M Excision of the Rectum for Carcinoma—Lynch's Simplification
2 45 P M Thoracoplasty—Semb Modification
3 05 P M Management of the Hypertrophied Nose
3 30 P M Clinical Manifestations of Allergy
4 30 P M Colitis and the Diarrheas
4 47 P M Construction of New Ear for Congenital Absence.
5 27 P M Interposition of Uterus
5 47 P M Technical Aspects of Intravenous Serum Therapy of Pneumonia
6 05 P M Afternoon show terminates

Space C-43

Aaron Sumner Price, M D, New York Polyclinic Medical School and Hospital, New York

THE LAUGHLEN TEST FOR SYPHILIS

Description A new and accurate test for syphilis The reagent is a modified Kahn antigen, but the technic has been simplified to be adaptable to small laboratories or office use Time required for test is ten minutes Demonstration of technic and charts

Space C-44

Henry C Falk, M D, Gynecological Service, Harlem Hospital, New York

THE INFECTED ABORTION

Description Drawings in color showing various types of postabortal infection, paths by which infection travels, lesions produced by the various types of infection, methods of recognizing the various types, showing typical temperature charts and a description of the management of various types

Space C-45

James F Hart, M D, and James R Lisa, M D, Welfare Island City Hospital, New York

HISTOGENESIS OF HEPATIC CIRRHOSIS

Description Diagrams illustrating the changes in the liver following injury from hepatotoxic agents supplemented with photographs and photomicrographs

Space C-46

Samuel Weiss, M D, William B Rawls, M D, and Vera L Collins, M D, New York Polyclinic Medical School and Hospital, New York

LIVER FUNCTION IN RHEUMATOID (CHRONIC INFECTIOUS) ARTHRITIS

Description The present study was made to determine whether the liver plays an important role in arthritic states It is based on 100 cases (1932–1937) studied at the Gastroenterological and Arthritis clinics of the New York Polyclinic Medical School and Hospital

Space C-47

Leo Wilson, M D, and Raphael Kurzrok, M.D, Morrisania City Hospital, New York

PRIMARY AMENORRHEA DUE TO CONGENITAL NONFUNCTION OF THE OVARIES.

Description Photographs and roentgenograms illustrating the growth of the breasts and genitalia following estrone therapy Description of clinical and hormone findings before and after treatment. End results and their significance.

Space C-48

Arthur A Knapp, M D, and S N Blackberg, Ph D, Department of Pharmacology, Columbia University, New York

NORMAL FUNDUS OCULI OF EXPERIMENTAL ANIMALS

Description Colored drawings of ocular fundi of experimental animals will be exhibited. The animals include macacus rhesus and ringtailed monkeys, rat, cat, dog, sheep, guinea pig, horse, pigeon, and ferret.

Space C-49

Sigmund Epstein, M D, Bronx Hospital, New York

TRANSPORTATION OF THE SICK AND WOUNDED IN HISTORY AND ART

Description One hundred or more prints, tracing the art history of the litter, the stretcher and the ambulance

Space C-50

Division of Syphilis Control, State Department of Health, Albany

SYPHILIS CONTROL

Description Photographs and text showing the roles of the physician, laboratory, local health officer, and State Department of Health in the control of syphilis

Space C-51

Dr Ralph Muckenfuss and Dr W D Sutliff, Bureau of Laboratories, New York City Department of Health

PNEUMONIA CONTROL

Description Method of pneumococcus typing for use of therapeutic serum in pneumonia, serums available, method of use and results obtained

Space C-52

Dr A B Wadsworth, New York State Department of Health, Albany

NEW DIAGNOSTIC PROCEDURES FOR INFECTIOUS DISEASES

12.26 P M Blood Transfusion
1 06 P M Morning show terminates

THURSDAY AFTERNOON

2 00 P M Disease of the Breast
2 15 P M Torek Orchidopexy
2 30 P M Tuberculosis in Childhood
2 40 P M Care of the Premature Infant
3 05 P M Restoration for Sub-Total Loss of Nose
3 35 P M Schede Operation for Residual Pleural Cavity
3 55 P M Sterility Its Causes, Investigation and Treatment
4 55 P M Carcinoma of the Breast
6 25 P M Afternoon show terminates

THURSDAY EVENING

7 00 P M Tuberculosis of Bones and Joints—Diagnosis — Complications—Rehabilitation
8 00 P M Technical Aspects of Intravenous Serum Therapy of Pneumonia
8 18 P M A New Day
8 29 P M Syphilis
9 59 P M Man Against Microbe
10 14 P M Evening Show terminates

Motion Picture Exhibitors

AMERICAN MEDICAL ASSOCIATION Syphilis

GUSTAVE AUFRICHT, M D 1 Reconstruction of the Face and Neck
2 Combined Plastic Operation for Prominent Nose and Receding Chin
3 Mammaplastic Operation
4 Construction of New Ear for Congenital Absence.
5 Correction of Saddle Nose by Use of Nasal Tissues Only

BLOOD TRANSFUSION BETTERMENT ASSOCIATION Blood Transfusion

ROBERT E. BUCKLEY, M D Total Laryngectomy for Carcinoma of the Larynx

HERBERT C CHASE, M D Carcinoma of the Breast.

TIBOR DE CHOLNOKY, M D 1 Advanced Carcinoma of the Ear with Plastic Repair
2 Recurrent Carcinoma of the Rectum

MATHER CLEVELAND, M D, DAVID M BOSWORTH, M D, B M BOSWORTH, M D Tuberculosis of Bones and Joints—Diagnosis—Complications—Rehabilitation

WILLIAM M COOPER, M D Varicose Veins

LOUIS R DAVIDSON, M D 1 Thoracoplasty —Semb Modification 2 Schede Operation for Residual Pleural Cavity

JOHN DUFF, M D Pyelotomy for Calculus

WILLIAM Z FRADKIN, M D Colitis and the Diarrheas

Technical Exhibits

One of the features of the coming Annual Meeting is the unprecedented number of exhibitors participating in the Technical Exhibits Never before has this Society, or any other State Medical Society, had such a diversified and large number of technical exhibitors reserving space to display their products and services

It is needless to suggest that every member attending the 132nd Annual Meeting should take time to see each exhibit

The past has shown that practically no one misses the opportunity to inspect new products and equipment, and to familiarize themselves with services useful to the medical and surgical practitioner The Technical Exhibits enjoy, along with other features of an Annual Meeting, a constantly increasing attendance each year

In addition to the many who are constant exhibitors at Annual Meetings of the Medical Society of the State of New York, will be found many friends who have been serving the medical profession for years, but for the first time are making it possible for the physician to become a little more familiar with their products or services at a convenient time

For the benefit of members with office hours which do not permit spending much time at the meeting during the morning or afternoon, as well as for the busy delegate, the exhibit rooms will be open until 10 30 P M on Tuesday

The following list shows the impressive number of outstanding concerns participating in the 1938 Annual Meeting

Aceon Oxygen & Ambulance Service Inc. New York
Adlanco X-Ray Corp New York
Allergia Products Co Newton, Mass
American Hospital Supply Chicago, Ill
American Safety Razor Corp Brooklyn

EXPERT MEDICAL TESTIMONY

JOHN KIRKLAND CLARK
Member of the New York Bar

Medical expert testimony classifies itself roughly into three major groups (1) Injuries resulting from negligent or willful torts—whether they be claims between two individuals, or workmen's compensation claims, or accident claims against individuals who are represented by insurance companies, (2) inquiries into mental condition, whether the question arises in probate proceedings, a criminal trial, a matrimonial case, or incidental to some other issue, and (3) claims of malpractice by members of the medical profession

Except in the latter class of cases, in which lawyers find it almost impossible to obtain reputable or supposedly reputable medical experts to testify for a plaintiff, one is accustomed to find in the other two groups of cases an apparently well-qualified medical expert, on one side, answering the same hypothetical question "yes" which another similarly apparently well-qualified medical expert, on the other side, answers "no" This obviously is a situation which calls for careful, self-searching study in each profession and consideration of possible means to be adopted to end present conditions

Ingrained in the constitution of our state is the right to a jury trial in the determination of issues of fact arising in actions at law The historical basis for this method of trial was laid centuries ago in the development of the English common law In general, it is held that every issue of fact in the trial of a law case must be determined by a jury unless both parties agree to the contrary In the group of cases which we are discussing the physical condition, or the mental condition, of an individual, which is brought into question as one of the issues of a litigation, raises a question of fact which a jury, under this rule, apparently must decide.

There are strong arguments made from time to time for the abolition of jury trials In a recent survey in Connecticut, the results of which have just been published, the jury system in automobile accident litigation is designated as an "expensive, cumbersome and inefficient trial device."

Another illustration of this movement to do away with the jury trial in automobile accident cases, which constitute by far the largest volume of litigation in which so-called expert medical testimony is employed, is the strong effort now under way to do away completely with litigation over injuries received in automobile highway accidents by creating a new form of compensation roughly comparable to that employed in workmen's compensation cases This proposal will, I believe, be submitted to the constitutional convention this year

There is, and in my judgment there will continue to be, a sharp difference of opinion as to the desirability of doing away with jury trials, but my own opinion is that we may reasonably expect a continuance of the jury trial system for another generation In other words, I seriously doubt whether the jury trial of such cases will be discontinued for twenty or thirty years

No matter how one feels about the desirability of jury trials the propriety of submitting intricate questions of a medical nature to an average group of twelve men drawn as jurors is almost universally deprecated For the most part, few, if any, members of the average jury have any conception of what medical experts are talking about when they give their testimony About all they get is that one doctor says that the defendant ought to pay and the other doctor says he ought not to pay, and the conclusion from that comprehension, or lack of comprehension, of the value of the testimony of the two or more differing experts is based all too frequently upon the plausibility, or personality, of one or more of the experts on one side, as against those on the other side, rather than on inherent merit. Confronted as we are, however, by the continuance of the jury system in the solution

The above article, reprinted from the *New York Law Journal* is the substance of an address delivered by Mr Clark before the Medical Society of the County of New York at a recent meeting held at the New York Academy of Medicine.

PROGRAM OF THE WOMAN'S AUXILIARY

MRS FRANCIS R. IRVING, *President* MRS EDWIN A. GRIFFIN, *Convention Chairman*

Convention Headquarters, Hotel Waldorf-Astoria, New York City

All Doctors' wives will please register at Registration Desk, Carpenter Suite.

All Doctors' wives, whether members of a Woman's Auxiliary to a County Medical Society or not, are cordially invited to participate in all parts of the program

Monday, May 9

9 00 A M REGISTRATION OF DELEGATES, Carpenter Suite.
Mrs John L Bauer, *Chairman*
Mrs Charles A Gordon, *Vice-Chairman*
Mrs Elmer A Kleefield, *Vice-Chairman*
GENERAL REGISTRATION OF ALL DOCTORS' WIVES continuing to 5 00 P M through the Convention, Carpenter Suite.
Mrs Walter F Smith, *Chairman*
Mrs Raymond F Johnson, *Vice-Chairman*
Mrs Russell Fowler, *Vice-Chairman*

9 00–10 00 A M EXECUTIVE BOARD MEETING, Jansen Suite

10 00–12 30 P M HOUSE OF DELEGATES MEETING, Jansen Suite

2 00–4 00 P M CONTINUATION OF HOUSE OF DELEGATES MEETING, Jansen Suite.

2 00 P M ADDRESS BY MR DWIGHT ANDERSON, Subject "Public Relations and the Woman's Auxiliary"

2 00 P M HOBBY SHOW (to 10 00 P M)
Mrs Thomas B Wood, *Chairman*
Mrs G Scott Towne, *Vice-Chairman*
Mrs G Emerson Noll, *Vice-Chairman*

7 00 P M DINNER for Auxiliary Members and all Doctors' wives, and lay friends, Le Perroquet Suite

Tickets must be secured before 3 00 P M Monday, at Registration Desk, Carpenter Suite.
Mrs John W Mahoney, *Chairman*
Mrs Herman W Galster, *Vice-Chairman*
Mrs Carlton F Potter, *Chairman of Entertainment*

Tuesday, May 10

10 00 A M HOBBY SHOW (continued to 10 00 P M)

10 00 A M–12 00 M POST - CONVENTION MEETING

4 00–6 00 P M TEA, Le Perroquet Suite. Host Medical Society of the State of New York
Hostess Woman's Auxiliary to the Medical Society of the State of New York
Mrs Louis A VanKleeck, *Chairman*
Mrs John B D'Albora, *Vice-Chairman*

7 00 P M BANQUET of the Medical Society of the State of New York

Wednesday, May 11

10 00 A M–10 00 P M HOBBY SHOW
Day left for sight-seeing and shopping

Thursday, May 12

10 00 A M–12 00 M Call for Hobbies

Please Notice

AN INFORMATION BOOTH will be open Monday, Tuesday and Wednesday from 10 00 A M–4 00 P M
Mrs Morris W Henry, *Chairman*
Mrs George H Smith *Vice-Chairman*
Mrs Charles E Scofield, *Vice-Chairman*

at the trial the right to reach a determination and instruct the jury, but, in order to make this definite, chapter 690 of the Laws of 1933 specifically directs that the so-called "foreign law" shall be "determined by the court and included" in the charge to the jury

The query naturally suggests itself, is it not possible to provide by a similar statute that where a question raised by medical testimony arises in the course of the trial of an issue of fact the judge may be authorized to reach a determination on that subject and give his instruction to the jury thereon?

In other words, is it practicable, and if practicable advisable, to devise some method of procedure whereby the justice presiding at a trial, and presumably better qualified because of his training, may be enabled to pass upon such a question as one of medical condition, or the causal relation between injuries and disease, and, instead of leaving its determination to the jury, make a definite finding thereon and "lay down the law" to the jury on the subject?

The question will, no doubt, arise as to whether such a question which may be a material issue, or the material issue, in the litigation can be taken from the jury without violating the constitutional prohibition

If it should be held that it is probable that such a provision is in violation of the present terms of the constitution, is this a question worthy of consideration by the convention which is to assemble to consider the revisions of the constitution? If the plan is a highly desirable one and popular opinion can be efficiently organized to support it the people of the state would have the power by an amendment to the constitution at this coming convention to make possible the enactment of the necessary legislation

At this time, therefore, it is particularly worthwhile to consider the validity, logically and as a practical matter, of a course which shall enable the judge to determine such matters

A plan which has been suggested for general adoption in connection with the improvement of medical expert testimony has been the creation of the office of expert medical adviser to the court. It is proposed that there shall be created, either by the medical profession or by the joint action of the medical profession and the legal profession, through the courts, a panel of physicians really well qualified to act as experts in the several branches of medical practice. Either by the consent of the parties or by the action of the judge one, or perhaps three, of these men might be selected to act as consultants to enlighten the "conscience of the court" as to the questions of physical condition and causation from the medical point of view

This might be done either separate and apart from or in connection with the offering of medical expert testimony by the parties on either side. Whether or no the medical experts tendered by either side should likewise be restricted to men qualified by some accrediting agency of the profession or not, it would be reasonably certain that attorneys would not bring before a court testimony calling for a duly qualified expert in a particular subject of medical practice, with a doctor posing as an expert who was in fact not properly qualified

Objection is made to this plan of procedure on the ground that it would create a body of "political doctors"—members of the profession who would be attempting to curry favor with the justices of the court. I fear that it will not be in our day that we attain the highly desirable objective of a Bench which is entirely non-political Politics, to some extent, we shall for some time have in public office even among jurists If, however, the experts chosen by the court must first have been duly accredited by a board chosen by the medical profession we should at least have properly qualified doctors advising the court.

The committee representing your profession and mine, with which I have had the privilege of serving during the past year or so, has, I feel, a strong tendency to support some such proposal We must do something to drive out those who pose as medical experts without possessing the basic qualifications to sustain such a claim More could, no doubt, be done by a more active participation by the court in determining the preliminary question whether the "expertness" of the alleged expert is real or genuine

Under our practice it is, in my judgment, entirely practicable for a judge, without actually declining to permit a doctor to give testimony as an expert when he is insufficiently qualified, to indicate to the jury the faintness of his claim to expert qualifications I believe, however, that if our judges

of these problems, how can we best obtain reasonably reliable medical expert testimony and reasonably sound advice to the jury as to the implications growing out of that testimony as they affect the issues which the jury is to determine—and yet not employ a method which shall be declared unconstitutional because of the provision as to jury trials?

One suggestion I offer, which, in my judgment, is worthy of careful consideration, grows out of the decision of our highest court in connection with the determination of the validity of the method adopted in workmen's compensation cases for the qualification of medical experts in the various branches of the practice of the profession.

In the case of Szold v Outlet Embroidery Co, Inc. (274 N Y, 271), our highest court unanimously upheld a decision which precludes a medical expert from recovering the value of the services rendered by him to an injured person entitled to compensation under the Workmen's Compensation Law, unless the doctor has established his qualifications before an accrediting board conducted by the organized medical profession in the state. This is one of the most advanced decisions which our court has rendered in many years and constitutes one of the first, if not the first, recognition of the right of a governmental agency to adopt the classification of a professional accrediting agency created by a non-governmental association of members of a profession.

The Supreme Court of the United States has just declined to disturb the decision in *Szold* case (March 1938)

Of course, under the Medical Practice Act now in force the medical profession is much more self-conscious than the legal profession has ever been in this state. The current licensing provisions requiring annual renewals keep a "live" list of members of the medical profession who are actually engaged in practice. We lawyers have no such list of the members of our profession. Your state and local organizations embrace in their membership a substantially larger proportion of the doctors than our Bar associations include of the members of the Bar For your profession, then, the way has been, to some extent, paved by the progress made in the last score of years in the closer organization of your profession.

Now that our highest court has recognized the propriety in connection with workmen's compensation cases of restricting the participation of members of the medical profession to those who have established their qualification by the appropriate accrediting agency it would seem not a violent step forward to confine testimony of members of your profession who undertake to qualify as experts to those similarly qualified on a list of experts accredited by a suitable committee of your organization. You know far better than we lawyers know how large a percentage of those who are now engaged in giving expert medical testimony in accident cases would be precluded by the application of such a rule. From what I have heard I should imagine that a substantial proportion, if not a majority, of those who pose as experts would no longer be permitted to engage in that particular branch of their profession—of giving testimony as expert medical witnesses

The Court of Appeals decision is only one step forward. It protects the public only by the exclusion of a group of unworthy members of the medical profession from posing as experts. It still leaves the jury, in the trial of cases, at the mercy of the duly accredited and qualified medical experts who continue to practice this profession by giving expert testimony How can we enable the jury to be suitably enlightened and guided in the solution of the problem created by flatly contradictory medical testimony? Some of us who have been studying this problem have reached the conclusion that a practicable method may be found by enabling the judge to exercise a greater, if not a complete, power in the determination of the problems raised by conflicting medical testimony

Two methods have suggested themselves as possible and perhaps practicable. The first of these is suggested by the statute adopted a few years ago by our Legislature as a part of the Civil Practice Act dealing with the problem of determining what is the law in jurisdictions outside of the State of New York.

Many of you may not know that only comparatively recently the problem of determining what is the law of Connecticut, or what is the law of Ohio, or of one of the Provinces of Canada, or of any other foreign country, has been regarded as a question of fact to be determined by a trial of the issue before a jury Some decisions pointed toward giving the justice presiding

at the trial the right to reach a determination and instruct the jury, but, in order to make this definite, chapter 690 of the Laws of 1933 specifically directs that the so-called "foreign law" shall be "determined by the court and included" in the charge to the jury

The query naturally suggests itself, is it not possible to provide by a similar statute that where a question raised by medical testimony arises in the course of the trial of an issue of fact the judge may be authorized to reach a determination on that subject and give his instruction to the jury thereon?

In other words, is it practicable, and if practicable advisable, to devise some method of procedure whereby the justice presiding at a trial, and presumably better qualified because of his training, may be enabled to pass upon such a question as one of medical condition, or the causal relation between injuries and disease, and, instead of leaving its determination to the jury, make a definite finding thereon and "lay down the law" to the jury on the subject?

The question will, no doubt, arise as to whether such a question which may be a material issue, or the material issue, in the litigation can be taken from the jury without violating the constitutional prohibition

If it should be held that it is probable that such a provision is in violation of the present terms of the constitution, is this a question worthy of consideration by the convention which is to assemble to consider the revisions of the constitution? If the plan is a highly desirable one and popular opinion can be efficiently organized to support it the people of the state would have the power by an amendment to the constitution at this coming convention to make possible the enactment of the necessary legislation

At this time, therefore, it is particularly worthwhile to consider the validity, logically and as a practical matter, of a course which shall enable the judge to determine such matters

A plan which has been suggested for general adoption in connection with the improvement of medical expert testimony has been the creation of the office of expert medical adviser to the court. It is proposed that there shall be created, either by the medical profession or by the joint action of the medical profession and the legal profession, through the courts, a panel of physicians really well qualified to act as experts in the several branches of medical practice. Either by the consent of the parties or by the action of the judge one, or perhaps three, of these men might be selected to act as consultants to enlighten the "conscience of the court" as to the questions of physical condition and causation from the medical point of view

This might be done either separate and apart from or in connection with the offering of medical expert testimony by the parties on either side. Whether or no the medical experts tendered by either side should likewise be restricted to men qualified by some accrediting agency of the profession or not, it would be reasonably certain that attorneys would not bring before a court testimony calling for a duly qualified expert in a particular subject of medical practice, with a doctor posing as an expert who was in fact not properly qualified.

Objection is made to this plan of procedure on the ground that it would create a body of "political doctors"—members of the profession who would be attempting to curry favor with the justices of the court. I fear that it will not be in our day that we attain the highly desirable objective of a Bench which is entirely non-political Politics, to some extent, we shall for some time have in public office even among jurists If, however, the experts chosen by the court must first have been duly accredited by a board chosen by the medical profession we should at least have properly qualified doctors advising the court

The committee representing your profession and mine, with which I have had the privilege of serving during the past year or so, has, I feel, a strong tendency to support some such proposal We must do something to drive out those who pose as medical experts without possessing the basic qualifications to sustain such a claim More could, no doubt, be done by a more active participation by the court in determining the preliminary question whether the "expertness" of the alleged expert is real or genuine

Under our practice it is, in my judgment, entirely practicable for a judge, without actually declining to permit a doctor to give testimony as an expert when he is insufficiently qualified, to indicate to the jury the faintness of his claim to expert qualifications I believe, however, that if our judges

should have, as they preside on jury trials, the expert assistance of a fully qualified expert on such medical matters as are involved in the case on trial, we could pretty completely kill the practice of such posing

The problem remains, however, is such a course, or a similar course, giving power to the judge to pass upon such an essential question of fact as physical condition, or causation, from a medical standpoint, sufficiently desirable to gain the necessary support to justify an attempt to procure legislation and constitutional changes required to make the plan operative?

Although our studies are by no means as complete as we hope to make them before our research is completed, my own opinion is quite strong that we can look forward to reaching a conclusion, in the light of the decision in Szold v Outlet Embroidery Co, Inc, that a panel of experts can be created and that a law can be passed forbidding the introduction into evidence of any expert testimony on medical subjects except by persons thus shown to have been qualified. I am likewise strongly inclined to urge the proposal that an impartial medical expert chosen from such a panel should be available to the justice presiding at a trial where such a question is involved to whom the judge may turn for guidance and advice in reaching a determination as to the medical questions involved

One thing seems reasonably plain, and that is that unless the Bar and the medical profession clean house in this dirty room, the room will be torn out of the house and we shall have, instead of automobile accident litigation, some scheme of highway accident compensation which shall remove the determination of questions as to compensation for injuries from the jurisdiction of the courts and place it in the hands of yet another administrative commission. If the doctors and the lawyers feel that the determination of questions such as we are here discussing should continue to be handled by the courts we must jointly work out some such plan as embodied in those proposals which I have roughly sketched, or look forward in the not far distant future to a further invasion of the jurisdiction of our courts in the determination of the rights of persons injured in traffic accidents

---

EFFECTS OF CONTRACEPTIVES ON FERTILITY

Young people who try to "postpone" the arrival of little ones may find they have postponed it entirely, if certain British physicians are right. A discussion is going on in the *British Medical Journal* over a statement by Dr V B Green-Armytage, of London, that "contraceptive measures in the early days of marriage are inimical to pregnancy at a later date" This was questioned by a medical subcommittee of the National Birth Control Association, but an array of authorities were cited by Dr G H Alabaster in support of it, and Dr Green-Armytage, in the February 19 issue of the *B.M.J.*, gives these reasons for his belief

(*a*) That if the hymen is unruptured at the time of marriage, insertion of jellies or medicated pessaries upsets the physiological *p*H of the vagina, with the result that the cervix is bathed in an acid medium far lower than *p*H 4 for some hours The result is irritation of the external os with subsequent erosion and endocervicitis

(*b*) Should in the early years or months of matrimony rubber caps with a containing soluble pessary be applied to the cervix for a matter of twelve hours or longer the resulting effect is the same as in (*a*)

(*c*) I have noted this particularly during the last twenty years, during which time I have seen over 800 cases of sterility A large number of these have used (*a*) or (*b*)

(*d*) In the discussion I stated that if for medical or other reasons contraception was necessary in the early months of matrimony it should be relegated to the use of a condom by the husband and not by the insertion of chemicals of any kind by the woman

(*e*) It is of course well recognized and taught psychologically that the early and continued use of contraceptives, either by husband or wife, diminishes libido and orgasm in both parties

(*f*) I also referred to the statement by Professor Miles Phillips which appeared in the *B.M.J.* a few weeks ago under the heading of "Endometrioma" in a discussion at the North of England Gynaecological Society, stating the opinion that the early use of contraceptives was responsible for the increasing number of cases of endometrioma which are seen to-day in young people.

(*g*) There are other moral and minor factors with which I need not detain you, but I think you will find that experienced gynaecologists, male or female, will agree with my statement that contraceptive measures in the early days of marriage are inimical to pregnancy at a later date.

Public Health News

Trainees

J Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

"If you recite in detail the clinical history of a case cured by a simple but amazingly effective new method of treatment, I will try to listen politely but my mind may wander into speculation as to what the death rate from the disease in question was last year, and what will be the best procedure for seeing to it that all cases are discovered and treated with the new remedy Similarly, if I proceed to a lengthy exposition of costs and personnel distribution in syphilis control, your mind may revert to the electrocardiographic findings in the aortitis case you saw last week."

In these graphic terms Dr George H Ramsey described on the last day of February to the Medical Society of the County of New York, the differing viewpoints of the clinical physician and the health officer On the following day, I visited the School of Hygiene of Johns Hopkins University There I found eight young physicians from New York State. All of them had received good training in clinical medicine. Some, at least, had had experience as practicing physicians Now as "epidemiologist-in-training" each is acquiring that familiarity with the mathematical ratios of diseases and of human beings which makes a stranger out of a perfectly good medical fellow creature.

Dean Lowell J Reed was so kind as to tell me just what he hopes that these medical graduates will gain by their year's residence in Baltimore. He spoke of the acquisition of an ability to think in terms of "mass medical problems," i e., to get the point of view so well-illustrated by Dr Ramsey in the sentence which I have quoted In the second place they learn how government machinery functions in the administration of public health, and in the third place they acquire certain technical skills in courses on the basic sciences of public health, for example, in parasitology and vital statistics I was taken to the vital statistics laboratory and found our New York trainees busy with such technical apparatus as the Munroe calculating machine. I was soon surrounded by a group of young men with very lively minds eager to know what is going on in various health departments in this state, and with more difficult problems too What is to be the future relation of welfare to public health? That was one of their questions and one that cannot be answered off hand The leading editorial of the March 1 issue of this Journal states the case for a federal department of health and reminds me that the most successful national ministry of health is really a ministry of health and welfare under the permanent direction of a medical chief, though the minister himself is perforce a politician

These trainees are exposed to new instruments, to new knowledge, and to a group of men who are not only teachers but prophets Moreover, our students are intimately associated with fellow students from all parts of the United States and from many foreign countries A common room is furnished within the school itself where they meet in the few hours allowed for relaxation Who knows what revolutionary concepts are generated among that wicker furniture?

Principles and Proposals of 1714

That brings me to an early set of proposals for the extension of medical care that came to my attention only last week though they were published in 1714 * Three quarters of the people in those days were found by the Quaker John Bellers to be poor and unable to secure either medical advice or suitable medicines This leads him to write

> If the safety of the people be the supreme law, we have few articles in our statute-book of so great a consequence as such an Act of Parliament will be, that shall make thorough provision for the improvement of medicine. Every able industrious laborer that is capable to have children who so untimely dies may be accounted £200 loss to the Kingdom As for our Nobility and Gentry, I leave their valuation to themselves

He put forward twelve proposals The first four and the sixth propose the establishment of hospitals The fifth proposes

* John Bellers "Essay towards the Improvement of Physick in Twelve Proposals" 1714

"that a public laboratory and a physical laboratory be provided" The seventh reads

That in every hundred of a county and parish of a city there be appointed one doctor and chirurgeon (or more if needful) to take care of the sick poor and they to be paid by the overseers of the poor

Nor was the research overlooked Mr Bellers proposed

That the Royal Society should have some endowment the better to enable them to carry out that useful and great design of improving men in the knowledge of nature of which medicine is a principal branch

"Needless to say," comments the historian,* "this remarkable document, which made the revolutionary proposal that hygiene should be a national subject, was altogether too far in advance of its time to have any effect"

* Barnard, Cyril C "Quaker Contributions to Medicine and Public Health," Friends' Quarterly Examiner, page 69, First Month 1938

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

Hygeia and Our Auxiliary

(Contributed by Mrs Carl Boettiger, Hygeia Chairman)

Hygeia is a magazine sponsored by the American Medical Association whose purpose it is to keep the public informed on matters regarding the prevention and treatment of disease The policy of *Hygeia* is to interpret to the layman in simple, understandable language information about scientific measures that are employed in prevention or cure of disease It likewise aims to deal with economic, social, political, industrial, and educational problems so far as they have bearing on the health and welfare of the people

Every member is full of timely suggestions and helps For illustration, the number for July 1937, contained articles on tennis, camp life, and snakebites—all suited to the vacation Its utility for placing before the public, medical truths, and exposing false cures and cults should make each auxiliary member anxious to spread this information Introducing *Hygeia* into homes, schools, and libraries is one of the best ways of educating the public and of helping the profession.

Every physician's wife should read *Hygeia* and become acquainted with its value to the layman against the danger of taking advice from persons not qualified to give information about health matters

Our slogan is "Every Auxiliary Member a Subscriber" So far we have fallen far short. This is such an important work for our Auxiliaries Can't we all unite and make a more determined effort to introduce *Hygeia,* not only to our Auxiliary members but to the general public?

KINGS COUNTY The monthly meeting of the Woman's Auxiliary to the Medical Society of the County of Kings was held March 8 at the Medical Society Building The Executive Board of the Auxiliary was hostess at a buffet luncheon prior to the meeting It was the third anniversary of the organization and the luncheon was given to celebrate this event.

A short business meeting over which Mrs Frederic E Elliott, president, presided, followed the luncheon Mrs Paul Eschweiler gave a report on the work of the legislative committee. A review of the new book "Madame Curie" was given by Mrs Vito Luongo

At the close of the business meeting, Mrs John L Bauer, Program Chairman, introduced Miss Laura Laurensen, whose subject was "The Potter's Wheel"

ROCKLAND COUNTY Mrs S W S Toms, Mrs J C Dingman, and Mrs John Sengstacken were elected directors of the Women's Auxiliary to the Rockland County Medical Society at a meeting and luncheon of the auxiliary held at the Villa Lafayette in Spring Valley on January 25 The auxiliary was organized one year ago and this was its first regular meeting to be held during its second year

Gas-masks numbering 26,000,000 have now been provided for the British civil population, and more are being turned out at the rate of 650,000 a week. They are stored in nitrogen to keep them in condition

Medical News

Allegany County

A SPECIAL MEETING of the Allegany County Medical Society was held on February 24 at The Hotel Belmont, to re-enact the constitution and by-laws, as the original, adopted many years ago, had become lost through the changing official personnel

Bronx County

DRS JOSHUA H LEINER AND Lewis J Doshay addressed the Bronx County Medical Society on February 16 on "Present Trends in Psychiatric Prognosis and Therapy"

A JOINT MEETING of the Bronx County Medical and Dental Societies was held at the Concourse Plaza Hotel on March 8 Robert M Box, Ph D, D D S, of Toronto, read a paper on "Maxillogenetic Migraine," and discussion followed.

Broome County

DR. HYMAN SNEIRSON addressed the Broome County Medical Society at Binghamton on March 8 on "Intestinal Obstruction" Discussion was led by Dr S S Sanderson

Chemung County

MORE THAN sixty physicians attended a meeting of the Chemung County Medical Society on March 1 at St. Joseph's Hospital in Elmira

After a meeting of the hospital staff physicians, at which Dr Raymond A Turnbull presided, a lecture on abdominal surgery was given by Dr John H Burke, Sr

Dr John H Burke Jr, read a paper on orthopedic and traumatic surgery, illustrated with slides

Frederick H Clark, manager of Health and Credit Service, Inc., led a discussion of the group hospital plan

Erie County

ADOPTION OF A RESOLUTION providing that physicians be paid $2 for a home visit and $1 for an office visit in caring for welfare clients, with a maximum monthly allowance in physicians' bills to be fixed by the newly created social welfare board, featured the February 21 meeting of the Medical Society of the County of Erie in Hotel Statler, Buffalo

An article to be printed in the Society's *Bulletin* condemning a "diatribe against physicians" appearing in current issues of a weekly magazine was read The source of the "diatribe," which was published anonymously, is a former Buffalonian, the article states

Dr Frederic E. Elliott told "How Your Society Dues Are Spent," with graphic lantern slides, and Dr Joseph S Lawrence, State Executive Officer, spoke on "Legislation Pending"

A POLICY OF cooperation with the *Health board in its recent move to curtail alleged abuses of laboratory facilities of the city of Buffalo* was decided upon by officers and members of the Medical Society of the County of Erie at a forum meeting on February 28 The Health board's resolution specifies that "the examination of routine urinalysis, blood chemistry, blood count and the preparation of autogenous vaccines will be performed only for such patients as the physician in charge will vouch in writing that said patient is unable to pay for such service"

SO FREQUENT AND INSISTENT are the telephone demands on physicians for contributions to this or that fund allegedly of a charitable nature, that the Erie County *Comitia Minora found it necessary to adopt* a motion to the effect that physicians when called should ask the solicitor if he—or she—has made contact with the office of the Medical Society for a checkup of the worthiness of the project and the reliability of the promoters Physicians then can call Cleveland 1810 for verification A similar warning was published in the Bulletin of the Better Business Bureau last summer Usually a very small proportion of funds thus collected is expended for actual charity

THE BUFFALO ACADEMY OF MEDICINE on *March 9 listened to an address on* "The 1937 Anterior Poliomyelitis Epidemic in Toronto" by Frederick F Tisdall, M D F R C P (C) The Section of Obstetrics and Gynecology, on March 16, heard papers on "Vaginal Cesarean Section" by Irving W Potter, M D, "Vaginal Hysterectomy by the Clamp Method" by Milton G Potter, M D, and "Rupture of Puerperal Uterus" by Hugh C McDowell, M D

Kings County

THE FIRST PUBLIC APPEAL for funds by the Kings County Medical Society after 116 years realized $10,000 toward the Dr Frank D Jennings Memorial Building Fund at the dinner to Dr Charles H Goodrich, president of the Medical Society of the State of New York in the Hotel Astor, Manhattan, on February 22

THE PROBABILITY THAT A district health station will be incorporated into the plans for an addition to the Kings County Medical Society headquarters was disclosed on March 5 The annex for the society will cost between $500,000 and $750,000, while the city will be called upon to invest about $400,000 in the health center Dr John L Rice, Commissioner of Health, said a station for the Bedford section was on the ten-year plan of the department

THE CONEY ISLAND HOSPITAL Alumni Association honored Dr Philip I Nash, president-elect of the Kings County Medical Society, at its second annual dinner in the Hotel St. George on February 26 Some 300 medical men and their guests attended

Dr Nash has been practicing in Brooklyn for thirty-six years, is director of medicine at the Coney Island Hospital, and medical assistant to the office of District Attorney Geoghan

THE RIDGEBORO MEDICAL SOCIETY will hold its monthly meeting on April 14 at the Kings County Lighting Co at 6740 Fourth Ave Dr Joseph H Globus, of Mt. Sinai Hospital of New York, will be the speaker The discussion will be by Dr A M Rabiner Dr William Ostrow is the newly elected president of the Medical Society

Livingston County

DR. ROBERT LEWIS, only physician in the town of Leicester for the past several years, has removed to Penn Yan where he joined the Foster-Hatch medical group His removal leaves Leicester without a resident physician Dr Lewis has served as secretary of the Livingston County Medical Society

Nassau County

THE FORMATION OF A Nassau county chapter of the Long Island Medical College Alumni Association was a feature of the dinner meeting of the association on February 21 in Rockville Centre. Officers elected were Dr Kenneth T Young, president, Dr H McD Painton, secretary, and Dr Jack Blimblum, treasurer

CONGRATULATIONS TO County Executive J Russel Sprague and to the county health board for its selection of Dr Earle G Brown as Nassau's new health commissioner, and assurance of cooperation were included in a resolution sent to Mr Sprague and other Nassau officials by the Medical Society of the County of Nassau. The resolution was passed unanimously on March 1 after Dr Benjamin R Allison, head of the board of health, had reported on Dr Brown's selection The meeting in the Bar Association building, Mineola, was the largest in the history of the medical group, according to J Louis Neff, executive secretary, who announced that more than 150 medical men attended, and all voted in favor of the resolution of approval, proposed by Dr Louis H Bauer

The meeting was the first annual "members night," and the program was made up of five-minute papers by more than a dozen members

"THERE IS NO POLITICS in lunacy but plenty of lunacy in politics," according to Dr George A Smith, who retired recently after devoting fifty years of his life to the care of the insane.

Looking back that span of years, Dr Smith insists he can not recall a single case in which, through political influence, a criminal was admitted to an insane asylum as a means of escaping the consequences of his acts

As reported in Nassau county papers, Dr Smith also belittled the thought that a sane person could be wrongfully committed to an institution for the insane. In the present age of scientific study of mental disorders, medical men would discover in a short time that the patient was not insane, he insisted

Dr Smith was medical superintendent of Central Islip State Hospital for thirty-seven years, superintendent at Hart's Island for three years, assistant superintendent at Hart's Island for ten years, and a member of the governor's personal commission to inquire into the mental condition of condemned prisoners for seventeen years

New York County

THE GOLD MEDAL OF THE New York Academy of Medicine was presented on March 3 to Dr Bela Schick, distinguished pediatrician, on the twenty-fifth anniversary of the announcement of the "Schick Test" for determining susceptibility to diphtheria, one of the greatest advances in the conquest of that disease of childhood The honor was conferred on Dr Schick at the New York Academy of Medicine by Dr James Alexander

Miller, president of the academy, before a gathering of New York physicians and scientists

DR. FRANCIS CRUGER EDGERTON, for many years chief surgeon at St Francis Hospital, died on February 19 at Doctor's Hospital He had been ill with pneumonia for several days Dr Edgerton was sixty-four

DR. CHARLES ALEXANDER CLINTON, a member of an old New York family and a physician in New York city for many years, died suddenly on March 4 at his office at the age of seventy-three He retired from private practice in 1931 to become medical director of the Macfadden Foundation, also becoming medical editor of *Physical Culture*, a Macfadden publication

DR. S J THANNHAUSER, of the Tufts Medical School, will speak at the New York Academy of Medicine at 4 30 on April 8 on liver function tests and diet treatment.

A ROUND TABLE DISCUSSION on heart diseases will be held at the New York Academy of Medicine at 4 30 on April 12

DR. REUBEN OTTENBERG, of the College of Physicians and Surgeons, will speak at the New York Academy of Medicine on April 15 at 4 30 on hemolytic streptococcus infections

FROM BRITISH GUINEA'S inland jungles came word of the death of Dr Frederick John Fox, New York scientist, and the safety of other members of an expedition searching for Paul Redfern, long-missing American aviator

A terse message said Dr Fox had died on Devil's Hole Island while other members of the Redfern search party under Theodore J Waldeck, hard-pressed for food, were making their way to Warwah, their destination

It was believed that Dr Fox died of exposure

The party left Georgetown several weeks ago on the search for Redfern, who vanished in 1927 while flying from the United States to South America Since the aviator's disappearance reports have trickled out of the jungle from time to time that he survived a crack up and was living as a "white god" with an Indian tribe in the interior

Dr Fox was a dermatologist with an office at 667 Madison Avenue and a home in South Salem, N Y He was graduated from Toronto University with an M D degree in 1908 and was senior dermatologist at the West Side Hospital and Dispensary

On December 13 last the thirteenth expedition in the ten-year quest for Redfern started up the Essequibo River from Bartica, British Guiana The expedition comprised Mr and Mrs Theodore J Waldeck, Dr Fox and William Aston Chanler, all of New York On January 4 the party was reported marooned on Devil's Hole by native crewman who returned to Bartica with the expedition's only boat after a dispute over food supplies, which they said were dangerously low

SIR WILLIAM ARBUTHNOT LANE, British surgeon, was guest of honor on February 15 at a dinner of the International Medical Club of America at the Hotel Delmonico

Sir William told of a few of his major achievements, resorting largely to anecdote, and dismissing as "accidental" accomplishments for which his profession has long honored him Giving as a basic idea his belief that "we bear a simple mechanical relationship to our surroundings and any alteration of that relationship entails damages to the individual," he told of his use of metal plates in fracture surgery, of his operating upon children under 4, of his studies of the effect upon the skeleton of its owner's occupation, and of his subcutaneous injection of saline solution

Harold Chapple, senior obstetrical surgeon and gynecologist of Guy's Hospital, London, and Sir Gerald Campbell, British Consul General also spoke and Dr William Seaman Bainbridge presided Sir Gerald asked his audience to perform two operations—one to temper the "too-excited" half of the world, the other to stir the "too-indifferent" half These might help "save the world for democracy," Sir Gerald added, although he said he was not certain what that meant these days

Onondaga County

THE ONONDAGA COUNTY Medical Society met in the auditorium of Syracuse University College of Medicine March 1 Papers were read by Dr Earl E Mack on "A Review of Our Present Day Conception of Food Deficiency Syndromes," by Dr Arthur B Raffle on "150 Cases of Appendicitis," and by Dr A. B Siewers on "A Case of Madness Cured by Blood Transfusion."

The Syracuse Academy of Medicine held a joint meeting with the Syracuse Eye, Ear, Nose and Throat Club March 15 at the University Club to hear Dr Edmund B Spaeth of Philadelphia, author of "Ophthalmic Plastic Surgery," speak on "Ptosis and Its Correction."

Queens County

QUEENS PHYSICIANS WERE warned at their meeting on February 24 by Dr Morris Fishbein of Chicago, editor of the *Journal* of the American Medical Association, that unless the medical profession studies and prescribes for the nation's present-day medical problems they may be compelled to accept a form of socialized medicine under government regulation

If this should happen, Dr Fishbein continued, the medical profession will degenerate, as, the speaker contended, the profession has in Sweden, Germany and other nations in which the government supervises physicans and their practices

Dr Fishbein spoke before 500 doctors in the auditorium of the Queens County Medical Society and devoted a greater part of his two-hour address to an attack on federal and private agencies which in recent years have studied and prescribed cures for the nation's medical ills

"A great deal of agitation is going on without those who are doing the agitating knowing what it's all about," the speaker said "The things which are being found out in these studies do not give a true picture of the medical situation as it is

"The medical care of its people is not the first duty of a government, as some agencies would like to have us believe The government's first duty is to provide every man with a job at sufficient wages to provide fuel, clothing, food and shelter to him and his family There probably wouldn't be a medical problem in this country if every man had that kind of a job"

DR GERARD L MOENCH, F A C S, associate professor of gynecology, New York Post-Graduate Hospital, spoke before the Medical Society of Queens on "Newer Concepts of Infertility," on March 4

Schenectady County

MEMBERS OF THE Union College Chapter of the Society of Sigma Xi and of the Schenectady County Medical Society heard Dean Robert S Cunningham of the Albany Medical College discuss "Nutrition and Endocrinology as They Are Related to Medical Problems," on February 13

Dean Cunningham's address was delivered in the Old Chapel, after a dinner in Hale House. Members of the Medical Society were guests of the Sigma Xi Society

Ulster County

HEADING THE FIRST SURGICAL unit to reach the interior of China under the sponsorship of the American League for Peace and Democracy, Dr Charles Parsons, well known Kingston physician and surgeon, has reached Hankow, China, temporary capital of the Chinese government, it is announced by Dr Henry L Bibby and Dr Elizabeth Parsons, who has carried on her husband's practice in addition to her own since his departure about the first of the year

DR. ALEXANDER A STERN, one of the founders of the Kingston Hospital and a leading surgeon and physician of Kingston for forty-nine years, died at the Kingston Hospital after a long illness, on February 26 He was a former president of the Ulster County Medical Society

Westchester County

THE PUBLIC HEALTH COMMITTEE of the Westchester Medical Society is conducting a series of "post graduate refresher sessions" for practicing physicians, consisting of practical demonstrations and lectures on technical points in diagnosis and treatment, given semi-monthly

The series began in February at Grasslands Hospital, with a session on pneumonia given by the division of internal medicine, the division of pathology and the section of anesthesia of Grasslands Hospital staff Then the committee gave programs on March 7, devoted to syphilis and March 30, to gonorrhea

In April, the committee on tuberculosis, under the chairmanship of Dr William Godfrey Childress will present a program

In May, the emphasis will be an maternal welfare, with a session on normal obstetrics and another on prenatal and postnatal care and care of the premature infant.

Dr Reginald A Higgons is chairman of the public health committee, other members of which are Doctors Edward H Marsh, John E. Gundy, M B Brahdy, Fairfax Hall, Donald R. Reed, and Romeo Roberto

DR. CHARLES C SWEET was host on March 1 at a dinner meeting of the Westchester Surgical Society

A paper entitled "Cancer of the Colon" was presented by Dr Sweet and discussed by the other surgeons present.

DR. WILLIAM HADDEN IRISH addressed the Medical Society of the County of Westchester on March 15 on "Common Disabilities of the Knee Joint"

Hospital News

Shorter Hospital Stay Now

HOSPITALS IN WHICH BABIES are born in Pennsylvania used to keep the mothers an average of twenty-one days But in the last few years, this length of time has steadily decreased Now the average stay is ten to twelve days Hospitals bills have been reduced in proportion, and chances of normal recovery, as well, have been very much improved, says a statement prepared by Miss Mabel Barr, superintendent, St. Christopher's Hospital for Children, Philadelphia.

Some other illnesses and the length of time spent in the hospital, compared to 1905 figures, are Gallbladder operations, twenty days, instead of thirty-eight, diabetes, thirteen days, as compared to forty-five, appendicitis twelve days, as compared to twenty-eight. Time has been saved—and time is money!

Relatively few persons may be aware of these achievements in modern hospital care, the reduction of amounts expended for individual illnesses, the modern surgical patient's greatly increased comfort, safety, and assurance of improvement and recovery

It is indeed expensive for the hospital, but is good for the patient and for the community in which its modern hospitals, open day and night, are rendering an irreplaceable service

The average length of stay of hospital patients is steadily dropping This is not news remarks the *Modern Hospital* But it may be news to most hospital administrators and trustees to know how many patients there are today who stay only one, two or three days in the hospital

Recently a large university hospital analyzed the length of stay of all private service patients discharged during June and July 1937 The results are revealing A total of twenty-one per cent of all these patients stayed one day only Nearly nine per cent stayed two days and another eight per cent stayed three days Thus in all thirty-eight per cent stayed three days or less

This high percentage of short stay cases was not due primarily to the ear, nose and throat department, as only 186 of the 1,487 patients reviewed were entered in that department. It is true that seventy-four per cent of these patients stayed but one day and eighty-nine per cent stayed three days or less But in the department of medicine fifteen per cent stayed one day and fifty-two per cent, three days or less In surgery the percentages were thirteen and twenty-seven, respectively For other departments the corresponding figures were pediatrics, twenty-four and forty-nine per cent, dermatology, 0 and twenty-nine per cent, urology, forty-one and sixty-two per cent, gynecology, fifteen and thirty-two per cent, eye, four and eleven per cent, obstetrics, eight and thirteen per cent, and orthopedics, thirty-three and fifty per cent (The figures for dermatology, urology and orthopedics were based on small samples and may not be truly indicative

From these data it is apparent that hospitals, insofar as this institution is typical, are nowadays offering a quite different type of service than a generation or two ago Many of these patients must be coming primarily to utilize the diagnostic facilities of the hospital and only incidentally to occupy beds and receive intensive nursing care.

This is an indication that the public is learning to use hospitals more intelligently, to use them before long bed stays become necessary

To the thoughtful hospital administrator and trustee, this analysis will suggest the importance of providing adequate personnel and equipment for the service of the public in diagnostic and other short-stay cases To the executive and trustee of hospital service insurance plans, it will show the necessity of studying carefully the scope of services provided and trying to predict as well as possible what these changing trends in the public's use of hospitals may do to existing statistics To the medical profession it may suggest the desirability of even closer professional and, perhaps, economic association with hospitals

Newsy Notes

MEMBERS OF THE board of directors of the New York Tuberculosis and Health Association have voted to join with the Public Health Relations Committee of the New York Academy of Medicine in urging upon the New York City Planning Commission "prompt action for the recommendation of new hospitals for tuberculosis patients to meet the urgent need of 5,000 additional beds in this city"

THE W P A FEDERAL MUSIC PROJECT in New York City supplies music teachers and entertainers to provide concerts and dances in the psychiatric wards of Bellevue, Kings County, Creedmoor and Brooklyn Street Hospitals Patients with talent participate. It is pointed out that dances and band concerts have been given in mental hospitals for nearly a hundred years

TWO SECOND COUSINS HAVE attacked the will of the late Nettie C Roe providing funds to build a hospital at Patchogue, L I, and the legal proceedings may delay its erection Ground was broken for it on Christmas day, and contracts were nearly ready for bids

EFFECTS OF THE "recession" were evident at St Francis Hospital at Port Jervis last year The annual report reveals that more than two-thirds of the patients treated during 1937 were unable to pay the full amount of their hospital charges compared with less than fifty per cent the previous year

WITH RECEIPTS AND EXPENDITURES both slightly increased, the deficit of Corning Hospital during 1937 was $3,976, nearly $2,000 less than in 1936, states the annual financial report of Walter W Oakley, treasurer

THE FRIENDS OF ST JOHN'S HOSPITAL, Long Island City, will hold their annual dance and entertainment on May 6 at the Hotel Commodore, Manhattan

THE 14TH CLINICAL SESSION on chronic pulmonary diseases, under the auspices of the Tuberculosis Sanitorium Conference of Metropolitan New York, will be held at the Cornell University Medical College on April 13, at 8 30 P M

THE SWEDISH HOSPITAL IN Brooklyn, through Colonel A W J Pohl, executive officer, announces its campaign to raise $250,000 promises to reach its goal within a few weeks

Many prominent civic leaders are cooperating to raise this fund, proceeds of which will go toward doubling the hospital's bed capacity

Impetus was given the drive by the plan devised by Michael Boras, automobile dealer of 1743 Bushwick Ave. Any person who donates $275 to the hospital receives a certificate of credit of equal value toward the purchase of a new automobile from Mr Boras' firm

UNSATISFACTORY CONDITIONS IN private institutions for the aged and the chronically ill receiving city funds have impelled Commissioner Goldwater to issue new rules Among them it is required that each home for the aged must have "a competent, graduate, full-time resident physician" and "an active staff of visiting specialists," and each institution for the chronically ill must have "an active visiting staff of physicians qualified in all specialties," and "an intern staff in the ratio of one to twenty-five patients"

COOPERATING IN THE DRIVE of the Cattaraugus County Health Department to reduce the number of deaths of premature infants in the county, the Sisters of the Third Order of St. Francis are planning to launch a special premature service in St. Francis Hospital, now under construction in Olean A special room is being set aside for prematures, and air conditioning features will be installed, together with incubators and other equipment needed in the care of prematures Two Sister nurses of the Order are now studying maternal and child health work in a Boston hospital in preparation for the start of the new premature service

EMPLOYEE GROUPS AS SMALL as two are included in the hospital service plan of the *Hospital Service Corporation of Western* New York, under a change in the rules just authorized by the board of directors, it is announced.

The change is made, the *management* states, in order to make the hospital available to employees of professional men, small stores and other establishments of two or more employees The minimum group formerly was five The one hundred per cent enrollment provision is retained—that is, all of the two or more employes must apply for the service.

THIS LETTER TO THE Bronx *Home News* is worth quoting It is written by J Nathaniel Lefowitz, who says

"Two of my relatives were recently confined to Morrisania Hospital at the same time, both suffering from serious illness which required exacting care and attention They were in different parts of the building, and in visiting them I came in contact with their respective nurses, doctors, attendants and immediate bedside *companions*

"My observations led me to appreciate deeply the efficiency, kindness and zeal with which the staff nurses performed the most laborious and trying tasks

"In this great city, where so many people needlessly and thoughtlessly heap unjust criticism on our hospitals, it is refreshing to find at first hand that for the most part this criticism is unwarranted and that praise is really warranted

"My two relatives and the patients near them had only the highest praise for the nurses

"I believe that Morrisania Hospital is indeed a credit to both the City and to the Borough of the Bronx."

Improvements

CONTRACTS FOR COMPLETION of the maternity annex to Jamestown General Hospital have been awarded The work will cost $17,598

A UNIT TO COST $150,000 to house private patients is being planned for the City Hospital in Binghamton

THE REPORT OF DIRECTOR James R Clark of the Southside Hospital at Babylon shows that in the past year a new electric elevator was installed, costing $5,500, a new sterilizer was put in the operating room, and an electro-surgical unit added. Two new oxygen tents were acquired and other modern pieces of equipment. A new steam and hot water system was also installed at a cost of $7,500, saving twenty-five per cent in fuel

PLANS ARE UNDER WAY to secure a modern respirator for the Chenango Memorial Hospital for the treatment of infantile paralysis cases

MENTAL HYGIENE CLINICS have been added at the Morrisania and Queens General Hospitals to meet pressing needs of the rapidly growing populations of the Bronx and Queens Heretofore patients from these boroughs have been obliged to travel to Bellevue Hospital clinic in Manhattan, or to Kings County Hospital in Brooklyn

A CAMPAIGN FOR A NEW New York city hospital to serve the communities of Throggs Neck, Pelham Bay, City Island, Unionport and Clason Point, in the East Bronx, is under way and backers of the drive have appealed for support of civic, social, business and patriotic organizations in those sections

METHODS OF RAISING AT LEAST $250,000 needed for construction of a proposed new, five-story, 250-bed hospital adjacent to their present buildings, were discussed on Feb 15 at a meeting of fifty members of the executive board of the Crippled Children's Division of the Jewish Sanitarium and Hospital for Chronic Diseases, E 49th St and Rutland Road, Brooklyn A committee was chosen to devise ways and means

Counsel, Medical Society of the State of New York

Validity of Amendments to Workmen's Compensation Law Upheld by Highest Court

On previous occasions in these columns reference has been made to the progress through the Courts of the now well-known case of Szold v Outlet Embroidery Supply Company On March 7, 1938, a ruling was made in said case by the Supreme Court of the United States, which is of such importance to members of the medical profession, not only in this State but throughout the country as well, that further comment upon the case is well justified.

The Szold case was instituted in the Supreme Court, New York County, by a practicing physician to recover a fee for the rendering of medical services The services in question were rendered to an employee of the defendant who was entitled to receive medical care under the Workmen's Compensation Law The plaintiff alleged that he had been requested to render such treatment to the employee by the defendant employer In his complaint the plaintiff failed to allege that he had been duly authorized to render medical care under the Workmen's Compensation Law as amended by the Laws of 1935, particularly Section 13-b of said law The defendant made an application before Mr Justice Shientag, at Special Term, to dismiss the complaint for insufficiency, thereby bringing up for consideration the scope and validity of many of the important amendments to the Workmen's Compensation Law which had been enacted in 1935 Mr Justice Shientag granted the motion to dismiss plaintiff's complaint and in so deciding, handed down an extremely well-written opinion *

The plaintiff, not satisfied by the ruling of the lower court, appealed first to the Appellate Division of the Supreme Court in the First Judicial Department and then to the Court of Appeals In May 1937 that Court rendered its decision affirming the judgment of the Special Term, Judge Loughran writing the opinion of the court.**

Having exhausted his remedies within the courts of this State, plaintiff carried the matter to the Supreme Court of the United States, contending that the decision was a violation of his rights under the Federal Constitution The Supreme Court finally dismissed the appeal with a *Per Curiam* decision to the effect that after hearing argument, it appeared that no substantial Federal question was involved. No formal opinion was written by that Court in finally disposing of the action The Court, however, in support of its action cited certain cases in which there had previously been rulings that it is within the power of a state to make proper regulations for the practice of medicine

Whenever some new and wide reaching legislation becomes effective it is inevitable that some case will be presented to test out the scope and validity of the statute in question, and the Szold case has well served in proving the soundness of the Workmen's Compensation Law in its present form.

The growth and development of the Workmen's Compensation Law has been a long and gradual process, and as time went on abuses have developed in connection with its administration. The first such law when enacted years ago was declared unconstitutional In 1913 a section was added to the Constitution of the State of New York expressly authorizing such legislation, the avowed purpose of which was to be "for the protection of the lives, health or safety of employees" After that Section became a part of the basic law of the State, another Workmen's Compensation Law was enacted which became effective in 1914 From time to time changes have been made by the legislature as their need became manifest.

Prior to the 1935 amendments, while it was provided that injured employees were to be furnished medical care and treatment, the law contained very little language regulating the rendering of medical care under the Act The guiding principle was that the employer was to provide medical care, and it was he who in ordinary cases chose the physician to render that care. The matter of what sort of a physician was chosen to render the care, and what sort of care was rendered was left open Being left open, flagrant abuses developed which are

*159 Misc. 911
**274 N Y 271

only too well-known to the members of organized medicine Medical care became degraded into a commercialized venture Unscrupulous physicians and so-called medical clinics undertook to exploit the worker, the employer and the insurance carrier Rebating, fee-splitting, solicitation, and lifting of cases was widespread

Organized medicine had voiced its protests to such abuses, and on occasions had called for changes in the Law Finally, the Governor appointed a joint committee of the Medical Society of the State of New York and the Academy of Medicine to study the entire situation and report recommendations to him

After a study of many months this committee reported to the Governor and proposed many changes Governor Lehman then in a special message to the legislature in 1934 submitted the Committee's report to that body and called for action

The legislature responded and passed the so-called 1935 amendments to the Workmen's Compensation Law For the first time organized medicine, as represented by the various County Medical Societies and by the Medical Society of the State of New York, was given a definite part in the administration of the Law The large and important part played by these societies in connection with the authorizing of physicians to render compensation medical care, in disciplining such physicians, and in arbitrating disputes is now well-known throughout the State

In the Szold case the question for determination by the Courts went to the very roots of this entire structure set up by the 1935 Amendments The plaintiff contended that whether authorized under the law or not he had a common law right to be compensated for care rendered to an injured workman upon a private arrangement with the employer He claimed that it was unreasonable for the State, having licensed him to practice medicine, to impose the additional requirement of a special authorization to treat injured workmen He claimed that the delegation of duties to Medical Societies, non-governmental agencies, was unlawful and violative of both the State and Federal Constitutions He also claimed that the provisions relative to compulsory arbitration in disputes over medical bills (Section 13-g) violated his constitutional right by depriving him of trial by jury

If plaintiff had prevailed in any of these claims, a severe blow would have been dealt to the proper administration of the Workmen's Compensation Law However, our Court of Appeals has specifically ruled against the plaintiff on each of his contentions, and the Supreme Court of the United States has declined to interfere with the decision of the State Courts in the matter

---

Foreign Body in Eye

A physician who specialized in diseases and surgery of the eye was consulted by a man about forty years of age who was referred to him by a general practitioner The patient gave a history that the day before he had been engaged in clipping a wire fence when some metallic chips flew into his right eye. A careful examination revealed the presence of a foreign substance in the cornea of the right eye with perforation of the cornea and anterior synchiae. Vision at the time was about 20/100 Under medication the doctor removed a fragment of wire from the cornea and after that had been done he determined that there was an additional fragment located in the lens Since the said fragment was deeply imbedded, he determined not to attempt its removal and permitted it to remain unless the eye should show evidence of nontolerance It was the physician's intention to wait and remove it with the cataract which would eventually develop and thus subject the eye to a minimum of trauma The patient returned to the doctor's office on four subsequent occasions within the next week and although the patient complained of pain the eye seemed to be definitely improved. During that period of time, the doctor issued prescriptions for the purpose of alleviating the patient's condition and he was directed to return to the doctor's office for further care which he failed to do

It was later learned that the patient went to another doctor who about a week later removed the foreign body by a magnet and also performed an iridectomy

A malpractice action was brought against the physician who had first undertaken to treat the case in which the charge was made that he had negligently failed to properly remove all of the foreign matter in plaintiff's eye as a result of which it was claimed that he was almost completely blind. A physical examination made of the plaintiff indicated the presence of a cataract with vision of 20/100 and it was the opinion of the examining physician that the defect of vision was not progressive.

When the case came on for trial, plaintiff's attorney was not ready to proceed and after the case had been delayed for a considerable period of time, an application was made to the Court to dismiss the action for lack of prosecution Plaintiff thereupon consented to discontinue the action thereby admitting that he was unable to establish that the defendant had been guilty of malpractice in caring for him.

Across the Desk

A National Crusade to "Keep Fit"

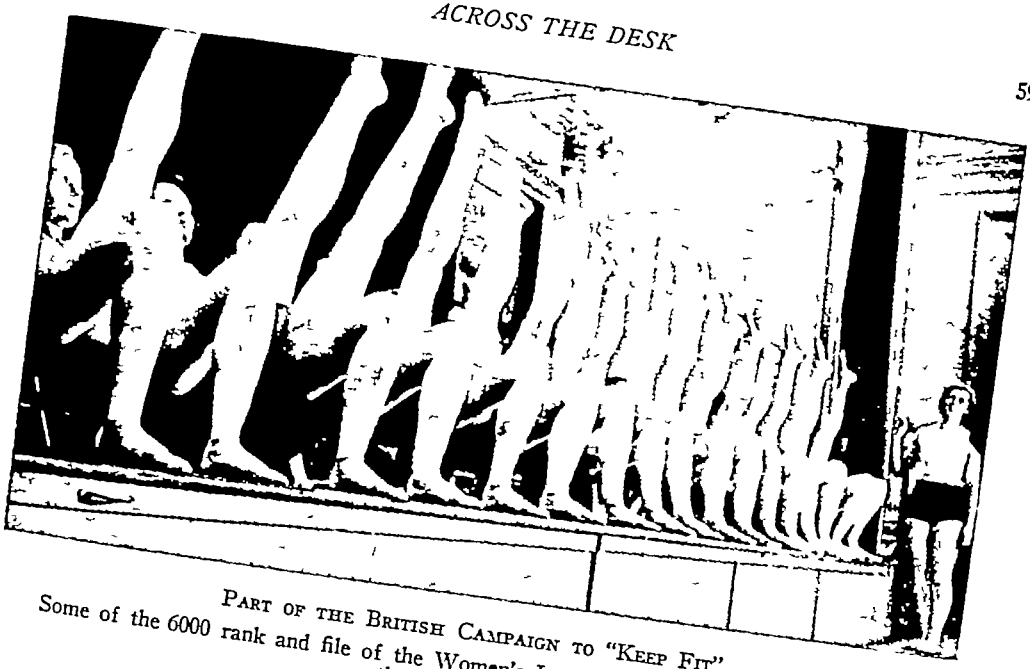
ENORMOUS POPULAR CAMPAIGNS are on in Great Britain, Japan, and other countries to "keep fit" Fit to fight is perhaps really meant in lands shadowed by the threat of war, but there is no reason why we should not keep fit to live in peace just as well as fit to die in battle In fact, if anything, health is more important if we expect to stay on the sunny side of the sod for a normal span of life. We may think other nations have gone crazy in some ways, but a craze to keep in good shape physically is the very essence of sanity—*mens sana in corpore sano*

The significant thing about this sort of movement is that it is not just an effort to keep out of the hospital, or two jumps ahead of the undertaker Lord Harder said at one of the meetings in England that what he had in mind when he spoke of fitness was "health and happiness," and that the chief object should be not to make life longer but to make life better and happier Thousands of people, perhaps most people, are not getting their full measure of the joy and exhilaration of living because they are below par physically They are not sick but they are not entirely well To them life is a dull and drab business They find no thrill in the songs of birds, the sweet breath of flowers, the purple aurora of dawn, or the crimson glory of sunset. Their work is just a job, and the rosiest sunrise means only another day

Get the Works Clicking Right

Now it may be respectfully submitted that when one person finds our world a place of wonder and joy, while another finds it little better than a dreary prison, then the second is in some way out of harmony Something is wrong in him somewhere, and it is a good bet that if he can get his works clicking right, if he can make himself "fit", he will know once more that effervescence of good spirits that made him dance and whistle his way along the street in his early teens A campaign to "keep fit," to restore our physical machinery to smooth, easy-running, efficient harmony, would be repaid a hundred times in the gain in national happiness and well-being

That is what the British are trying to do, with their National Fitness Council to guide the movement. Leaders in industry and commerce, employers, school and local authorities, athletic clubs, and everybody, in short, are called upon to help make the British people fit for whatever is before them Here is a duty, said King George in February, at a big public gathering in London, "which will bring swift returns in human happiness, for nothing adds more to the pleasure of life and to the joy of work and play than physical fitness" Prolonged cheering greeted his words



Resurrection of the Half-Dead

Here is a new way of measuring national health, only we cannot measure it. It is too intangible We sometimes compare the health of different nations by their death-rates, but how about people in a half-dead and half-alive condition? Some, we may say, are seventy-five per cent alive, some fifty, some twenty-five The problem is to restore them to one hundred per cent, or as near it as we can We can not raise the dead, but maybe we can restore the half-dead to life, and that is worth trying The British are out to reduce the number of the dead-and-alive folks, and it is a move worth emulation.

A fine thing, too, about their plan, is that it is entirely voluntary There is no regimentation Nobody is dragooned into it Said King George, speaking particularly to youth

"The future will be in your keeping The present is your opportunity to fit yourselves for a full, and active, and useful, and therefore happy life The decision is left to your free choice."

A speaker at an earlier meeting stressed the part to be played by the family doctor in the health crusade He is expected to work individually with the families under his care, to interest them all in the campaign, and help bring them up to one hundred per cent fitness In other words, it

PART OF THE BRITISH CAMPAIGN TO "KEEP FIT"
Some of the 6000 rank and file of the Women's League of Health and Beauty doing their daily dozen.

is of, by, and for the people, there is no regimentation about it, and the doctor works individually with his patient, the only way to produce the best results

How the Japanese Go At It

Japan, which has attained power and dominance by imitating other nations, is out with a "keep fit" movement, too Every morning last summer the Tokyo central broadcasting station made the ether throb with music for gymnastic exercises, and all the nation was supposed to do a "daily dozen" at 6 A.M The yards of schools, temples, and factories, the parks and the seashore were alive with little brown figures contorting themselves in strange postures unknown to their ancestors, in order to be "fit." It is reckoned that 10,000,000 men and children all over the country participated. Another part of the plan provides for an inquiry into the health of every family As applied to the big industrial city Osaka, we read in a letter from Japan to the *A M A Journal*, the work will be done by twelve health officers

Each office will supervise the examination of 60,000 citizens The reports will include the following information how many members of the family have died, particularly infants, the number of workers in the family, the number who have been dismissed or are out of employment and the causes of dismissal

Concerning the individual citizen, the examination will inquire into his habits, tastes, occupation, office hours, leisure hours, monthly income, medical history, hours of sleep, cough, sputum, night-sweats, fatigue, tendency to catch cold, stomach complaints, and the price and ingredients of his lunch.

Is Such a Movement Possible Here?

Could a campaign to "keep fit," supervised by competent medical leaders, be successfully aroused and carried through in this country? Certainly there has never been a time when the people have been more concerned about their health Cruel advantage has been taken of their anxiety by every sort of unscrupulous charlatan and pseudo-medical scalawag to dupe the credulous by the thousands and pour down their throats a cataract of nauseous nostrums that make them worse instead of better What a blessing it would be if a tidal wave of health sanity could flood the land, sweep into oblivion the quacks and their quackery, and float a great national movement to make and keep everyone fit for life, for work, for happiness! It would require the full time of every physician in America. Other nations are doing it. The door of opportunity stands wide open Who will lead the way?

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N Y Acknowledgment of receipt will be made in these columns and deemed sufficient notification Selection for review will be based on merit and the interest to our readers.

REVIEWED

Drug Addiction. By E W Adams, M D Octavo of 173 pages New York, Oxford University Press, 1937 Cloth, $3 00

The conscience of the world has become more awake and concerned by the problem of drug addiction The evil is a universal one, and the whole world is concerned about it In 1934, the Minister of Health in England appointed a committee to deal with the problem Dr Adams was one of its secretaries He had access to data unavailable to the average investigator The book that he has published carries a certain stamp of authority, and adds dignity to the entire investigation. It discusses almost every phase of the subject, prevalence, nature, causation, treatment, after-care, and prognosis It is well written, and will prove invaluable to those who have occasion to treat drug addicts, and of great interest to those who prescribe narcotic drugs

It is highly recommended as an authoritative book on the subject of drug addiction

IRVING J SANDS

A Text-Book of Ophthalmic Operations. By Harold Grimsdale, M D and Elmore Brewerton, F R C S Third edition Octavo of 322 pages, illustrated Baltimore, William Wood & Company, 1937 Cloth, $6 00

This little book is practically a compend of surgical technique, and as such, fills a necessary need It is useful to the neophyte in that it explains simply and clearly the actual steps of procedure. It is useful to the finished operator in that it enables him at a glance to refresh his mind on some technical point which may have escaped his memory in a rarely used procedure.

Obsolete operations have been omitted, and newer procedures included in this third edition, so that one need not think the work out of date. The bibliography at the end of each chapter lends a feeling of assurance that the authors have considered every aspect of this actively developing field.

JOHN N EVANS

The Abdominal Surgery of Children By Sir Lancelot Barrington-Ward, F R C S Second edition Octavo of 333 pages, illustrated New York, Oxford University Press, 1937 Cloth, $9 00

This is a well written text covering a field of surgery which has been sorely in need of emphasis Following a chapter on general principles, in which the differences between surgery of the child and of the adult are well brought out, the common and rare surgical diseases are thoroughly described. Treatment advised is uniformly sound. The work is well arranged, excellently illustrated, and will be of value to any surgeon

OUTSTANDINGLY VALUABLE BOOKS

Ten by New York Authors. See Convention Booth 38

Appleton, Hamilton and Tchaperoff—SURFACE AND RADIOLOGICAL ANATOMY Ideal new book with 338 illustrations, mostly photogravure or color, only $5 50

Bailey—PHYSICAL SIGNS IN CLINICAL SURGERY Sixth (1937) edition, great aid to diagnosis, thousands using 318 illustrations, $6 50

Bailey—EMERGENCY SURGERY New 1938 edition of another famous work by Hamilton Bailey Splendidly illustrated operative technique, $14 00

Barnhill—SURGICAL ANATOMY OF HEAD AND NECK. Incomparable post graduate course by a famous teacher and surgeon. Buckram, 934 pages, 431 illustrations, many colored, $20 00

Best and Taylor—PHYSIOLOGICAL BASIS OF MEDICAL PRACTICE. Our biggest seller in 1937 World famous physiologists make practical applications clear to physicians and surgeons, 1700 pages, 400 illustrations, $10 00

Beck—OBSTETRICAL PRACTICE. Brooklyn produced a new standard textbook so thoroughly sensible and practical its success was immediate with medical schools and physicians everywhere. $7 00

Brock—BASIS OF CLINICAL NEUROLOGY Manhattan rang the bell with this excellent introduction to diseases of the nervous system. $4 75

Bierman—MEDICAL APPLICATIONS OF THE SHORT WAVE CURRENT The very latest book on this important subject by one of New York's highest authorities. $5 00 *In preparation*

Cabot and Adams—PHYSICAL DIAGNOSIS New 1938 entirely revised and up to-date 12th edition of one of America's most famous and valuable standard textbooks $5 00 *In preparation*

Champion—MEDICAL INFORMATION FOR SOCIAL WORKERS Just the necessary information for the growing army of workers who have contacts with sick persons or matters related to medicine, and must understand. $3 50 *In preparation.*

Eddy and Dalldorf—THE AVITAMINOSES More successful New Yorkers. Read scientific up-to-date facts as to vitamin deficiencies and what can be done. Debunks many advertised fallacies $4 50

Dickinson and Bryant—CONTROL OF CONCEPTION Another New York book. Second (1938) edition of the most scientific and authoritative work written for the guidance of physicians on this subject. $4 50

French—INDEX OF DIFFERENTIAL DIAGNOSIS Fifth (1936) edition of what thousands of physicians esteem as the most valuable single volume in all medical literature. $16 00

Geckeler—FRACTURES AND DISLOCATIONS New and most sensible book for general practitioners. $4 00

Grant—METHOD OF ANATOMY New kind of anatomical textbook with practical applications. Concise, inexpensive, 672 pages, 571 illustrations, $6 00

INTERNATIONAL MEDICAL ANNUAL, 1938 56th year Invaluable review of year's advances in therapeutics in entire field of medicine and surgery, in one volume, $6 00

Kerr—OPERATIVE OBSTETRICS Fourth (1937) edition of a great international standard work. $12 00

Kracke — CLINICAL PATHOLOGY Entirely new, 1938, and first book on laboratory medicine by a group of twelve experts All the emphasis is on diagnosis with one most reliable method for each laboratory procedure. Ideal for general practitioners. More full page plates than any similar book (31) many colored. Only $6 00

Kurzrok—ENDOCRINES IN OBSTETRICS AND GYNECOLOGY Another outstandingly valuable new book by a New York physician. Vitally important up to date knowledge essential to successful practice. $7 50

MacKenna—DISEASES OF THE SKIN New (1937) fourth edition of a really helpful 525 page book for general practitioners, with 45 colored plates yet only $7 00

Maher—ELECTROCARDIOGRAPHY Second (1937) edition, just the up-to-date information every internist and general practitioner needs. $4 00

Markowitz—EXPERIMENTAL SURGERY Remarkable new guide for research workers and for gaining proficiency in operative technique. $7 00

May—DISEASES OF THE EYE. Probably New York's most famous medical book. Translated into all the principal languages and used throughout the world. 15th edition, 1937, $4 00

McMurray—ORTHOPEDIC SURGERY Practical new book by a former assistant of Sir Robert Jones and his successor at Liverpool University, $5 00

Portman—OPERATIVE TECHNIQUE IN OTORHINOLARYNGOLOGY A translation now in progress providing a post graduate course every otolaryngologist will find a profitable investment.

Purves-Stewart—DIAGNOSIS OF NERVOUS DISEASES Sir James Purves-Stewart is one of the world's highest authorities in neurology Eighth edition (1937) $10 00.

Rose and Carless (Coughlin)—SURGERY Thousands of American surgeons were raised on this great text book. All of them should have for reference this 15th (1937) edition. American edition edited by Dr W T Coughlin, St. Louis University, $9 00

Rowlands and Turner—OPERATIONS OF SURGERY Post graduate course in the surgical methods of celebrated Guy's Hospital. Eighth edition, 2 vols., $20 00

Sauerbruch and O'Shaughnessy—THORACIC SURGERY Sauerbruch of Berlin and O Shaughnessy of London. A wonderful combination of knowledge and experience. $13 50

Sobotka—PHYSIOLOGICAL CHEMISTRY OF THE BILE—THE CHEMISTRY OF THE STERIDS. Two more New York books, companion volumes but sold separately Revealing splendid research work done at Mount Sinai Hospital. Volume 1, $3 00 Volume 2, $8 50

Stedman—PRACTICAL MEDICAL DICTIONARY A New Yorker's famous standard work used throughout the English-speaking world. Get Stedman for authoritative and reliable reference. 13th edition (1936) $7 50

Young—GENITAL ABNORMALITIES, HERMAPHRODITISM, etc. Unique and extraordinary work by the world famous Johns Hopkins urologist. Marvellously illustrated Complete operative details of a new field of surgery $10 00

Tchaperoff—RADIOLOGICAL DIAGNOSIS Finest possible guide for physicians and surgeons, with 284 radiographic negatives in photogravure. First medical book to use this form of illustration Only $6 00

DIGESTIVE TRACT PAIN

Diagnosis and Treatment

By Chester M Jones, M D., Assistant Professor of Medicine Harvard University Physician Massachusetts General Hospital.

Presents a complete study of pain referred from all levels of the gastrointestinal tract in normal individuals, and describes the phenomena underlying most digestive tract symptoms $2 50

LEUKEMIA AND ALLIED DISORDERS

By Claude E Forkner A.M., M.D., Assistant Professor of Clinical Medicine Cornell University Medical School, and Assistant Attending Physician New York Hospital.

In this book the author has simplified and consolidated the various views on the subject and has presented a critical interpretation of the known facts in relation to the unknown *Ready in April. Probably* $5 00

SYPHILIS, GONORRHEA and the PUBLIC HEALTH

By Nels A Nelson B.S., M.D., F.A.P.H.A Director of the Division of Genitoinfectious Diseases, Massachusetts Department of Public Health, and Gladys L Crain, R.N., Epidemiologist Division of Genitoinfectious Diseases, Massachusetts Department of Public Health

An outstanding contribution toward the control and eventual eradication of this social evil. Presents not only the essential known facts concerning syphilis and gonorrhea, but also gives an account of the development of control programs to date and discusses the directions which they are taking $3 00

The Life of Chevalier Jackson

An Autobiography

From dramatic newspaper reports the world has learned of the skill with which this great surgeon has saved the lives of children by removing foreign bodies from lungs or bronchial tubes with the aid of his famous bronchoscope Few of us know, however, the story of Dr Jackson's life—how he came to take up this humanitarian work, how his remarkable skill was acquired All this and more is here recorded by Dr Jackson in his autobiography, beginning with his early childhood and continuing through the successive stages of his brilliant career The result makes fascinating reading

Ready in May Probably $3 50

The Conquest of Cholera

America's Greatest Scourge

By J S Chambers M D., Professor of Hygiene and Public Health Director of Student Health Service University of Kentucky

This is the fascinating story of America's battle with the tides of pestilence that swept this continent in the 19th century when Asiatic cholera reached our shores. From its outbreak in the United States in 1832 to its final conquest in 1892, we read the moving drama of cholera's relentless march, and of a nation's distress when bewildered physicians courageously but impotently fought a not understood pestilence. $4 75

Diagnosis Fat or Sugar Intolerance

Indicated Dryco Feedings

Prognosis Good

WHEN one of your babies fails to tolerate fat or sugar, you naturally seek to reduce the offending component in the formula But the problem remains to supply sufficient calories and adequate protein Dryco feedings, we believe, provide a solution Fed *without* sugar, the Dryco formula offers

1.3% fat
3.5% protein
5.1% lactose
0.8% minerals

The curd formed is soft, flocculent, readily tolerated by weakened digestive systems

This easily prepared Dryco modification can be continued indefinitely, or carbohydrate can be gradually added

A handy vest-pocket infant feeding schedule, embodying this successful feeding procedure, is yours for the asking Simply mail us the coupon below

THANK YOU, GENTLEMEN—

For Your Enthusiastic Approval Of

ZEUS

Trade Mark Registered U. S. & Foreign Countries.

the New Aluminum Filter-Holder That Eliminates Over 70% of Nicotine and Tar

Here's What Other Physicians Say About Zeus

● SINCE the Zeus Filter-Holder was first announced last November, we have received requests for scientific information from more that 1,000 physicians Many of these physicians have tried Zeus themselves—or observed its use by patients

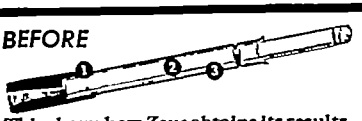
Obviously, we mention no names, but we feel some of their comments are worth passing on For example

"I am of the opinion that Zeus will be of great value, especially from my standpoint of ear, nose and throat specialization, wherein it often becomes expedient to relieve irritation of cigarette smoking, and so advise patients "

Another physician writes

"Believe Zeus has real scientific value in removing such a substantial percentage of the undesirable constituents of tobacco smoke reaching the respiratory system "

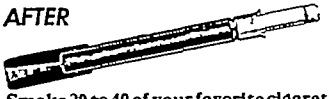
If a Patient Asks You About Zeus—



● ZEUS—so named because of its mnemonic value—is the product of two years' research in the laboratories of the Aluminum Company of America

The diagrams at the right illustrate its basic principle—an extra cigarette (any brand) inserted as filter in a special aluminum tube

Zeus results have been officially tested by the laboratory of the Italian Government Tobacco Monopoly in Rome, and confirmed by one of the leading scientific institutes of America



We will be glad to send, to any physician interested, a complete report of these laboratory tests Please address ZEUS CORP , 745 Fifth Ave , New York, N Y

BEFORE

This shows how *Zeus* obtains its results (1) Correct 'bit draws *all* smoke through (2) filter cigarette (any brand) inserted inside (3) special *aluminum* tube

AFTER

Smoke 20 to 40 of your favorite cigarettes then remove inserted cigarette and *look* at it! There is the proof It's nearly *black* ..actually its weight has increased 100%!

U S and Foreign Patents Pending.

for further data, address
LUCILE TOUCHMAN, R N, Supt.
27 LUDLOW STREET, YONKERS, N Y YONKERS 2100

STRICTLY
A
HIGH
CLASS
PRIVATE
SANITARIUM

recognized for 50 years by the medical profession

Restricted to a limited number of nervous and mental cases—not violent, dangerous, noisy, or otherwise objectionable—with special facilities for the care of aged and chronic cases

Environment and administration are such as affords the most beneficial atmosphere Contact with others is controlled through caring for the patients in suites (practically all with private baths) A fully qualified medical and nursing staff, physiotherapy hydrotherapy, massage, and occupational therapy in addition to attractive and modern buildings make "Falkirk in the Ramapos" one of America's most complete sanitaria

Convenience and accessibility in nearby accommodations and transportation for guests makes the location ideal The sanitarium and its program of treatment are so arranged that patients have greater comfort and service than found elsewhere

1709 Genesee St., Utica, N Y

Schools to Fit Every Need

A striking advantage of the private school is that the authorities study each boy and girl and shape their work and training to make good what is needed One child needs health-care, exercise, air, sunshine, one has never learned how to study, and seems backward because of previous improper school training, another has fallen into bad company in the public schools and needs the right moral influences And what is more, the private schools have special courses of study that fit the student for particular lines of life work, where the public schools have no such provision Perhaps the girl wishes an advanced course in finance and business management, in art, music, social training, social service, or library work. Such courses are to be had in the private schools Or she can study medical and dental nursing or prepare to be a medical assistant, learning the proper technic, terminology, and procedures The boy can learn mechanical and electrical engineering, chemistry, aviation, and almost anything that suits his ambition

The physician, too, as the family's guide, counselor and friend, may be able to do a lasting service by timely and wise advice on the right school

Visit the **MENNEN EXHIBIT** *at the Convention*

"Doctor, it means a lot to all us little fellers to have you see the MENNEN EXHIBIT at your convention I'm counting on you, doctor—'cause I want you to hear, at first hand, the latest news about the remarkable job Mennen Antiseptic Oil is doing to protect us babies"

* * *

Today, more than 90% of all hospitals important in maternity work use Mennen Antiseptic Oil in their nursery—to remove the vernix, for the initial skin prophylaxis, and for the routine daily oil rub Their experience proves that the Oil definitely helps to keep the infant's skin safer from impetigo, pustular rashes, and other infectious disorders Day in and day out, it will provide continuous adequate protection, without causing any dermatitis Its antiseptic potency is equal to the commonly used ammoniated mercury ointments

Mennen Antiseptic Oil is absolutely non-irritating, non-toxic and self-sterilizing; and is protected against rancidity Physicians generally recommend its daily use until the baby outgrows the diaper age

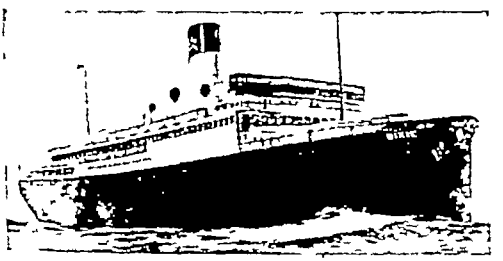
"We appreciate the whole-hearted cooperation of the MEDICAL SOCIETY of the STATE of NEW YORK"

TRAVEL *and* RESORTS

WHERE TO GO • HOW TO GO • WHAT TO DO • WHERE TO STAY • WHERE TO DINE

Your Guide to "lil old New York"



This is primarily for the benefit of New Yorkers themselves, for it is said that of all people unconscious of the attractions of this Metropolis, the resident of New York City is the guiltiest It is undoubtedly true that the out-of-towner sees more of the world's greatest city than does the person born and raised within its "grand canyons" But we publish the following guide to "things to see" for the visitor too, so he or she may perchance find one more item of interest that may have been overlooked on previous trips to New York

Of the thousand and one marvels that make up the pulse-beat of this modern beehive of humans, the following are offered as the most outstanding and worth spending the time between meeting sessions and a few pennies to see

Just a handspring from "Meeting Headquarters" is the now world-famed Rockefeller Center—a city within a city Here there are several guided tours to take you through Broadcasting Studios, buildings of different nations, the Gardens of the Nations, a view of the City from 850 feet high, and many other things including its famous theatres and its Museum of Science and Industry

Private automobiles may be hired (see advertised rental services in this issue) for drives around the city, through Long Island, etc., over great bridges, beautiful State parkways, through vehicular tunnels, and for quick transportation to famous golf *(Continued on page lxxviii)*

17 BATTERY PLACE NEW YORK

THERE IS

no hay fever

IN BERMUDA

Hay fever causals (see report quoted below) simply do not exist in Bermuda. Nor can they go there, thanks to Bermuda's unique air-conditioning apparatus

This apparatus consists of salt water and a system of prevailing breezes All air bound for Bermuda must cross a 600-mile stretch of briny deep En route, even the most persistent ragweed pollen—as well as soot and cinders and taxi-cab honks—must weary and fall, despairing, into the waiting waves Thus the breeze continues on toward Bermuda in a state of constantly increasing cleanliness.

You, meanwhile, are sunning your complexion on these famous pink beaches Or perhaps you are splashing in multi-coloured surf playing golf tennis watching the yacht races—anything, in fact, but sneezing!

Bermuda's freedom from hay fever has long been known to visitors It received official confirmation when Professor Frederick H Hodgson, in August of 1935, spent several weeks there, under the auspices of the New York State Journal of Medicine, to secure an expert, unprejudiced opinion on the occurrence or absence of hay-fever causals in Bermuda

" *the Colony,*" stated Professor Hodgson's official report, *"passed a hundred per cent as a sanctuary for hay-fever sufferers"*

"BUT CAN I AFFORD BERMUDA?"

The inexpensiveness of a trip to Bermuda surprises those making their first visit. Round trip passage (with private bath) on a superlative liner costs as little as $65 for four luxurious days at sea In Bermuda the many attractive hotels and cottages offer accommodations at a wide range of price

ROUTE OF THE AIR-CONDITIONED
NORTH COAST LIMITED

For those who like to try something different in culinary arts, New York boasts of restaurants where the foods of almost every nation are featured (see advertisements in this issue and in your Medical Directory of New York, New Jersey and Connecticut)

Its hotels are more numerous and offer a greater choice of selection than anywhere else in the world. They offer every fulfillment of purse and taste as well as the comfort and service enjoyed nowhere else. (May we again refer you to advertisements in this issue, and remind you to make reservations early?)

To describe New York in full would be an endless task Information on items in particular may be had at your hotel or the travel services at your transportation terminal

As a fitting climax to what promises to be the Medical Society's greatest convention, a weekend at Atlantic City is suggested, or a cruise to Bermuda.

Special arrangements have been made by Travelways, Inc, travel agency for this JOURNAL, for a postconvention cruise to Bermuda—see their advertisement for details

For any information, in which we may be helpful, you are invited to call upon the NEW YORK STATE JOURNAL OF MEDICINE'S business and editorial offices

★

The Welcome of

SAN FRANCISCO

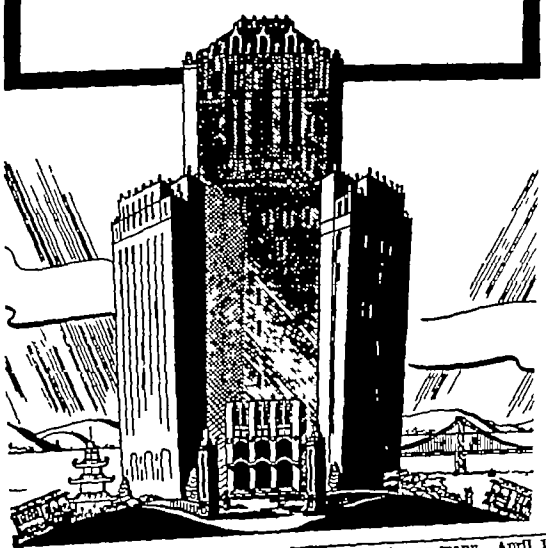
Traditional — Sincere
is extended to the

AMERICAN MEDICAL ASSOCIATION

June 13-17, 1938

★

The "Story City" of the West ★ ★ Superbly situated on her 14 hills, San Francisco is rich in beauty and in interest, unequalled at making the visitor genuinely welcome. An ideal setting for serious thought or carefree gaiety



Convention Headquarters ★ ★ High atop Nob Hill, San Francisco's most distinguished address, with a sweeping panorama of the Bay and great new Bridges, three minutes from shops and theaters, three blocks from old Chinatown, the MARK HOPKINS is San Francisco's finest, friendliest place to stay Garage just an elevator ride downstairs

Rates from $4 00 per day
Early Reservations advisable

GEORGE D SMITH *Manager*

★

THE MARK HOPKINS HOTEL

By word of mouth

The popularity of The Woodstock with members of The New York State Medical Society is best attested by the fact that those who stay here recommend it to their friends and return themselves whenever they visit New York.

Single from $2 50
Double from $4 00

Our restaurant is famous for good food and the cocktail lounge is a favorite meeting place before dinner or theatre

HOTEL WOODSTOCK

43rd Street just East of Broadway
Next to Town Hall
NEW YORK

links and other interesting sports places

Boat trips around Manhattan Island, to the Statue of Liberty (and believe it or not, only one in a thousand New Yorkers have ever stood at the base of the Goddess who proclaims "Sweet Land of Liberty"), across New York Bay, and other short water trips can be made for the smallest charge.

Bus sightseeing is also worthwhile. Take a Fifth Avenue bus for its entire run (10 cents one way) and truly see how the other half of the world lives—as well as some of the world's finest architecture, shops, and "fashions" Other bus lines will take you into the foreign sections of the city, to Chinatown, and to Coney Island.

Planes can be rented or regular trips taken at any one of the nearby airports, for views of the city from the sky—or to take you to Atlantic coast shore resorts in quick time.

For theatres—over 250 legitimate theatres are located within walking distance of the Meeting Headquarters, and offer every known type of entertainment from the play to the finest in motion pictures

There is every variety of night club in New York—some to satisfy the taste of the most fastidious, some bizarre.

For doctors who wish to take a "busman's holiday," New York has numerous medical centers, great medical schools, and the finest Medical Academies, as well as many noted clinics and allied institutions

LOW-COST FUNERALS

Contrary to impressions that sometimes prevail, Campbell service is *not* "high priced" In fact, many of the funerals we conduct cost less than $200 complete (Caskets $75 up—plainly price marked)

ORDER FROM YOUR DEALER

It Can Happen Here

Example of severe rickets in a sunny clime Courtesy of E H Christopherson, M D., San Diego, and of "California and Western Medicine"

LEST WE FORGET—we who are of the vitamin D era—severe rickets is not yet eradicated, and moderate and mild rickets are still prevalent Here is a white child, supposedly well fed, if judged by weight alone, a farm child apparently living out of doors a good deal This boy was reared in a state having a latitude between 37° and 42°, where the average amount of fall and winter sunshine is *equal to that in the major portion of the United States* And yet such stigmata of rickets as *genu varum* and the quadratic head are plain evidence that rickets does occur under these conditions

How much more likely, then, that rickets will develop among city-bred children who live under a smokepall for a large part of each year True, vitamin D is more or less routinely prescribed nowadays for infants But is the antiricketic routinely administered in the home? Does the child refuse it? Is it given in some unstandardized form, purchased from a false sense of economy because the physician did not specify the kind?

A uniformly potent source of vitamin D such as Oleum Percomorphum, administered regularly in proper dosage, can do more than protect against the gross visible deformities of rickets It may prevent hidden but nonetheless serious malformations of the chest and the pelvis and will aid in promoting good dentition Because the dosage is measured in *drops*, Oleum Percomorphum is well taken and well tolerated by infants and growing children Rigid bioassays assure a uniform potency —100 times the vitamins A and D content of cod liver oil* Oleum Percomorphum, moreover, is a natural product in which the vitamins are in the same ratio as in cod liver oil*

Oleum Percomorphum offers not less than 60,000 vitamin A units and 8,500 vitamin D units (U S P.) per gram. Supplied in 10 and 50 c. c. brown bottles also in 10-drop soluble gelatin capsules, each offering not less than 13,300 vitamin A units and 1,850 vitamin D units, in boxes of 25 and 100.

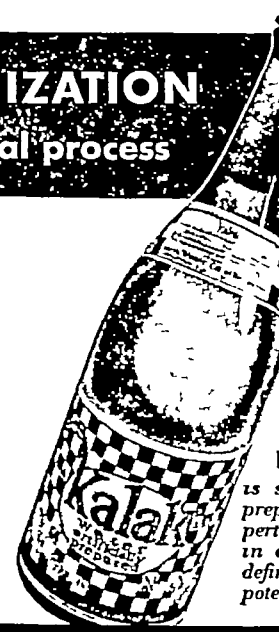
ORALLY OR BY INJECTION

Metrazol Tablets, Oral Solution and Powder for prescription compounding

COUNCIL ACCEPTED

FOR cardio-respiratory support in the emergencies of congestive heart failure or pneumonia prescribe Metrazol, tablets or in solution, three or four times a day. In extreme cases oral administration may be supplemented by injections.

1 Tablet = 1 cc. Solution = 1½ grains Powder



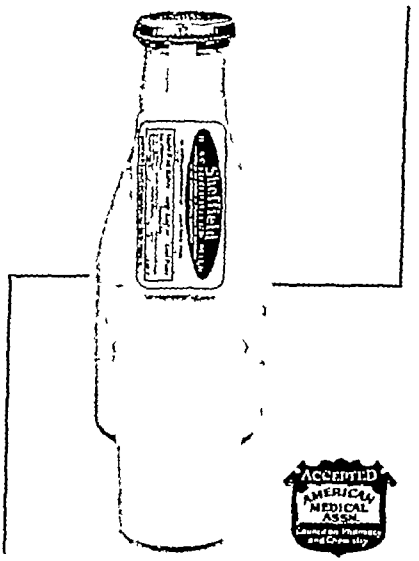
BILHUBER-KNOLL CORP, 154 Ogden Avenue, JERSEY CITY, N J

BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy

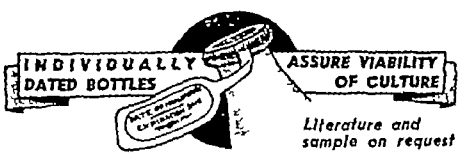


KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

KALAK WATER COMPANY OF NEW YORK, INC., 6 CHURCH STREET, NEW YORK CITY

when treating

FERMENTATIVE DIARRHEA



INCLUDE

SHEFFIELD B. ACIDOPHILUS MILK*

As early as 1920, the first clinical applications of *B acidophilus* culture, in treating intestinal disorders, revealed its value in cases of fermentative diarrhea Today, standard works on modern treatment include administration of *B acidophilus milk* to supplement excluding carbohydrates from the diet

Ingestion of *a B acidophilus milk* of an assured potency effects a gradual restoration of formed passages, and in severe cases, a disappearance of mucus as well The culture, however, can only be as effective as its potency—one of the several reasons you should recommend SHEFFIELD B Acidophilus Milk, in every case

Literature and sample on request

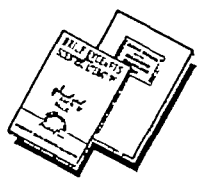
Tomorrow's Image is Being Cast Today

IRRADIATED EVAPORATED MILK

Tested 5 Ways for Vitamin "D" Potency!

When physicians prescribe Irradiated Evaporated Milk, they can be certain that the infant is getting beneficial amounts of Vitamin D because the potency and uniformity of the Vitamin D content of Irradiated Evaporated Milk are checked in five different ways (1) By accurate control of the intensity of ultra-violet radiation, (2) By scientific regulation of thickness of milk film to be irradiated, (3) By uniform rate of milk film flow through the use of specially designed pumps, (4) By reliable recording ammeters, which automatically record the amount of electrical energy consumed, and the number of hours of operation, and (5) through regular bioassays using the "Johns Hopkins Line Test," recognized as standard by the United States Pharmacopeia

Irradiated Evaporated Milk is rich in bone and tooth-building calcium and phosphorus It is cow's milk in its safest form—*sterilized* It is more readily digestible because it is *homogenized* and *heated* And it is one of the best and most efficient carriers of Vitamin D Irradiated Evaporated Milk is good rich cow s milk—*doubly concentrated*—and irradiated by the Steenbock process



Many of the best known brands of Evaporated Milk are Irradiated enriched with Vitamin D, by the Steenbock process. Yet this has not increased the cost of Evaporated Milk. Irradiated Evaporated Milk can be obtained in every community Through scrupulous and scientific control by the manufacturer and by frequent tests of both open market and factory samples uniformity of Vitamin D potency is assured

Major Operation

IT IS NO exaggeration to say that in Borden's system of milk production the regular soap-and-water scouring a Borden worker gives his hands is a major operation

This apparently incidental operation plays, we feel, an important part in safeguarding the purity of all Borden dairy products

For it is part of a fundamental devotion to cleanliness

And this devotion to cleanliness is, we believe, reflected alike in the most modern scientific equipment, and in our wholesome addiction to simple soap-and-water

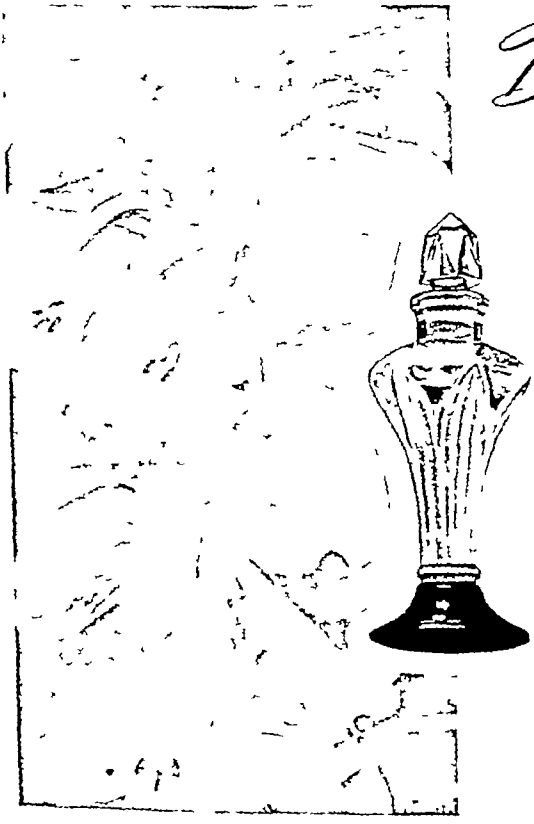
See the **NEW GOMCO** ELECTRIC ROTARY PUMP

at the N. Y. State Journal of Medicine Permanent Technical Exhibit



Features never before offered in pumps!

- Motor and compressor built into one compact unit—no visible moving parts—no danger of accident—only 3 points to oil every six months
- Bottles recessed into base and held immovable for easy transportation. Readily removed by one thumb screw
- Exceptionally quiet ⅓ H.P motor More compact, occupies space of only 9" x 12¼" with total height of only 10".
- Pump capable of producing more pressure and vacuum than needed —therefore operates under maximum and will last longer
- New type positive felt filters for ether and vacuum lines easily replaced with removal of only three screws.

INSPECTED—PROTECTED MILK

backed by daily plant inspection ..and microscopic bacteria counts where indicated

Microscopic appearance of high-grade rich milk from healthy cows No bacteria present The large cell in the center is a colostral corpuscle, occasionally appearing in all milk.

EVERY can of milk from every Dairylea Farm undergoes routine plant inspection every day Any variation from normal is checked microscopically—on at least two successive mornings For absolute accuracy, bacteria in 15 microscopic fields are counted from each sample taken

No improperly cooled milk, no improperly cleansed utensils escape the searching scrutiny of these interlocking inspections Incipient cases of mastitis or other diseases indicated by abnormal numbers of leucocytes—are frequently detected before they develop Inspection-protection that makes DAIRYLEA MILK a safe food for doctors to recommend

DAIRYLEA *Milk*

Our Pledge: We, the farmers of the Dairymen's League, recognize a definite obligation to the public Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality

How the Deaf Hear with
CORONATION ACOUSTICON

This diagram of the ear will help you explain both bone conduction and air conduction to your patients Interestingly colored it will look very attractive on the wall of your office. We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD, the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE for custom fittings on the Aurogange and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service.

• HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS, but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye glasses. Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations. Send us the names and addresses of these "hard to convince" patients Of course, your name will not be mentioned in our correspondence with them—unless you say so

See Acousticon at the Waldorf-Astoria

Don't miss Acousticon's exhibit in Booth 90 at the Annual Meeting of the Medical Society of the State of New York, May 9th to May 12th, 1938, New York City

THIS BOOKLET

free upon request

Many physicians have anemic patients This booklet tells the story of why copper with iron is more effective in the treatment of secondary and nutritional anemia how copper plays the unique role of a catalyst or activating agent in the metabolism of iron

From Abderhalden's findings, and the experiments of Steenbock, Hart and others to the perfected formula of McKESSON'S COPPER-IRON COMPOUND this booklet is authoritative and informative It gives the advantages of organic proteid combinations of copper and iron the reasons why the exact proteid combinations in McKesson's Copper-Iron Compound proved effective in many types of anemia why McKesson's product is non-toxic, non astringent, easily assimilated, does not affect elimination and will not harm the teeth It contains many case histories showing remarkable and sustained improvement in anemic patients, with McKesson's Copper-Iron Compound

It's a booklet we feel will be a valuable addition to your library Just send for it today, using the coupon below, and in addition you will receive a professional sample of McKESSON'S COPPER-IRON COMPOUND

Doctor's Girl "Friday"

SILENTLY they walk the Hospital corridors—keeping vigil over our loved ones. Their gentle hands soothe the fevered brow—their smiles cheer a weary soul. These Women in White, our modern Florence Nightingales—they stand beside the Doctor in every emergency.

LIGGETT DRUG STORES hail the NURSE—who daily performs duties not relished by most of us—yet she works willingly and without the applause that awaits women of the Stage and Screen. The Nurse is indispensable and yet when we leave the Hospital we can't remember her name. Some of us write fan letters to stars who entertain us for an hour but not one word of praise or thanks to the women who only helped us to recover our good health.

Yes, the most indispensable women on earth—Mothers and Nurses!

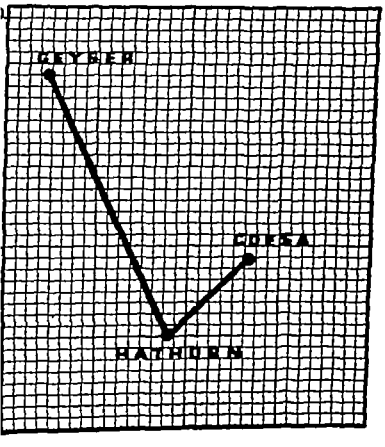
THE NATURAL MINERAL WATERS OF SARATOGA SPA
ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK



Poor Elimination from the Gall Bladder

is a condition in which Saratoga Spa's Coesa Water has resulted in notable usefulness In some patients with gall bladder conditions it has helped achieve the elimination of small concretions of a size which may pass through the cystic and common ducts

Coesa is a mildly laxative water, antacid and diuretic, and has been found beneficial in both gall bladder and liver conditions, and helpful in mild catarrh of the stomach and intestines

Professional literature is available on request addressed to W S McClellan, M.D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

RANTOSILK *and* HOLLANDEX
For Home and Hospital Use

● For bed sheets, pillow cases, surgeons' aprons, and surgical garments used in hospitals, take advantage of Rantosilk or Hollandex—the last word in processed surgical fabrics They are fine silk and lawn calendered with crepe rubber—are light in weight and will outwear much heavier material.

Their ability to withstand creasing, rolling and folding without the slightest harm to the surface commends it for hospital use They may be washed, boiled, autoclaved, stitched. Will not crack, peel, fade or stick. Resistant to acids, alkalies and heat The positive impregnation with rubber of each fibre accounts for the superiority of Rantosilk and Hollandex

SALYSAL

"RARE CHEMICALS"

(THE SALICYLIC ESTER OF SALICYLIC ACID)

EFFICIENT SALICYLATE THERAPY . . . . . WITHOUT LOCAL GASTRIC IRRITATION .. IN SMALLER DOSAGE . . . . .

Analgesic • Antipyretic • Antirheumatic

Grain for grain SALYSAL is about twice as effective therapeutically as sodium salicylate, and is therefore employed in one-half the dosage of the latter drug Being an ester it is not broken down in neutral or acid media, and the irritating quality of free salicylic acid on the gastric mucosa is thereby avoided SALYSAL is odorless and practically tasteless, and may be palatably administered in fruit juices, cereals or other articles of the diet.

Indicated in rheumatic fever, arthritis, neuritis, and in tonsillitis, colds, influenza or other infections of the upper respiratory tract.

• • •

SUPPLY Tablets of 5 grains in tubes of 10, bottles of 50, 250, and 1000, powder in one ounce bottles.

VESICOVAGINAL FISTULAE

Their Cause and Cure

NORMAN F MILLER, M D, *Ann Arbor, Mich*

From the Department of Obstetrics and Gynecology, University of Michigan

Discussion of bladder fistulae in the female has gradually disappeared from obstetric texts only to appear in treatises on gynecology Two reasons account for this shift, (1) operative trauma has become an increasingly prominent factor in their production and (2) most patients with fistulae gravitate to the gynecologist, urologist or general surgeon for repair

Fistulae resulting from obstetric trauma have undoubtedly decreased in frequency Pressure necrosis has been almost entirely eliminated, for excessively long, three and four day labors are seldom permitted today Furthermore greater care is exercised in management of the patient during the intrapartum period The overdistended bladder is carefully guarded against and catheterization prior to operative delivery is now routine With the advent of obstetric analgesia and amnesia, operative deliveries have become more frequent but this does not appear to have influenced the incidence of bladder fistulae, nor should it, if good judgment is exercised in their selection and performance

Almost a hundred years ago leading obstetricians recognized that forceps, properly used, prevented rather than caused fistulae This was stressed by Sims and other leaders of the time Undoubtedly trauma in the form of prolonged pressure in excessively long labors with subsequent necrosis was a prominent etiological factor The development of prenatal care, and a wider range of acceptable methods for delivery in patients with cephalopelvic dystocia has unquestionably reduced the hazards of bladder injury

The exact incidence of bladder fistulae resulting from obstetric trauma is difficult to determine Both patient and physician are reticent about admitting complications of this sort and furthermore the present day availability of hospitals and skilled surgical care leads to earlier rectification In contrast to the apparent decrease as a result of birth trauma, we see a definite increase in bladder fistulae following pelvic surgery About fifty per cent of the fistulae seen at the University of Michigan Hospital during the past five years occurred as the result of pelvic surgery Pelvic surgery for hysterectomy is the most frequent offender although other pelvic operations may be similarly complicated Fortunately postoperative fistulae are generally small and many heal spontaneously during the first few months following operation Others may do so when stimulated by cautery or fulguration Those remaining unhealed, although small, are generally more difficult to repair than the larger puerperal variety This

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

is readily understood when the two groups are compared

Postoperative fistulae are generally high in the vagina and difficult to expose On the other hand the larger postobstetric fistulae are readily accessible and their repair thereby simplified A healthy respect for the bladder during pelvic surgery and judgment in the use of either sharp or blunt dissection in the vicinity of this organ will go a long way toward keeping the surgeon out of trouble Similarly by keeping the bladder empty during operative delivery and by being mindful that obstetric forceps are primarily intended for traction and not rotation, morbidity from this source may be kept at a low figure

In the management of vesicovaginal fistulae we must not overlook the opportunities for prevention and primary healing I am confident that a fistula may sometimes be prevented by use of an indwelling catheter in patients where excessive bladder trauma is suspected or actual damage is known to have occurred With modern facilities for bladder drainage and irrigation, there appears to be little justification for neglecting this precaution in suspicious cases The prone position and local stimulation in the form of saline douches and other means for speeding-up healing should be liberally employed Early and persistent attention to these simple measures will lead to the closure of some and materially reduce the size of others Every older practitioner has long since recognized the remarkable healing powers of nature and nowhere is this better exemplified than by observing the gradual closure of what appeared to be a hopeless and unbearable bladder disaster

While early attempt at operative closure before the tissues are in healthy condition is inadvisable, stimulation of indolent edges by means of cautery or chemicals is well worth trial Operative closure may be attempted in the larger fistulae after three months, provided the tissues are in healthy condition Small fistulae may be treated conservatively for a longer period with the hope of spontaneous healing

"There are many roads that lead to Rome," and so, too, there are many surgical methods for correcting vesicovaginal fistulae In considering repair the physician should recognize his responsibility and undertake such treatment only if he is able to offer his patient every opportunity for successful outcome This is not idle talk—nor is it an attempt to steer these unfortunate women to medical centers No patient is more deserving of sympathy and help than the woman suffering social isolation and the mental and physical torture of uncontrolled urine drainage Since each unsuccessful attempt at repair materially reduces the chances for ultimate cure there is obviously little justification for bungling, or makeshift attempts at closure.

The physician contemplating operation for a bladder fistulae may well ask the following questions

1 Is patient in best possible physical condition?

2 What are the various methods of accomplishing repair?

3 Am I selecting the best approach for this particular case?

4 Shall I regret inadequate preoperative preparation or has my patient been properly prepared?

5 Am I properly fortified in knowledge, skill, and equipment to undertake such repair?

It is not too much to expect such detailed consideration when we recall that the first attempt at repair generally offers the best chance for cure, and with each succeeding attempt the chance for ultimate closure materially decreases No gynecologist, urologist or surgeon has yet become so adept in the repair of vesicovaginal fistula that he can afford to neglect the above mentioned points No stone should be left unturned in determining that patients so afflicted are given every chance for primary healing To this end then we may well consider the basic principles which underlie surgery of this type

Fortunately the blood supply to the pelvis and its mucous membranes is normally good and except where excessive scarring has taken place, this factor is seldom one to cause concern With successive attempts at repair and failure, the rapid increase in cicatrix or scar tissue formation occurs, vascularization of tissues is seriously impaired and renders further attempts at repair even less likely to be successful

Every surgeon recognizes excessive tension as a serious impediment to healing This is particularly true in the repair of fistulae Much can be done to avoid this and particular pains should be taken to recognize and overcome this obstacle to healing Jobert (de Lamballe) achieved this by making incisions lateral to the fistulae while Simon relied on tension sutures In the presence of excessive scarring where wide dissection around the fistula appears inadvisable, Jobert's suggestion may be followed to advantage but in patients operated for the first time this is seldom necessary, tension being avoided by adequate mobilization of the mucous membranes proper

It is difficult to evaluate the infection hazard in these cases That it plays a role in healing need scarcely be questioned Yet, when we recall that the great masters of the past century, Wutzer, Jobert de Lamballe, Simon, Brown, Bozeman, and Sims had no knowledge of asepsis and yet achieved almost unbelievable success it becomes difficult to view infection as a first rank hazard Doubtless individual resistance or bacterial immunity plays an important part. Even so the danger of incomplete union as a result of infection should be guarded against by appropriate preoperative preparation

In the early years of the present century, at least ten methods of approach were described Today only three of these approaches deserve consideration—the vaginal, the transvesical, and the transperitoneal It is not the purpose of this paper to delineate these methods Neither is it my intention nor desire to propagandize any one method and least of all my own Each method has its advantages and each has been adequately described in the literature *It is incumbent, indeed, it is the duty of the physician contemplating repair of vesicovaginal to familiarize himself with these accepted methods* Failure to do so means failure to qualify for this type of surgery Armed with complete information the physician is in a position to select that method which in his opinion best suits the condition

During the past five years all cases of vesicovaginal fistulae have been operated by the same technic at the University of Michigan Hospital I would have no hesitancy, however, in adopting the transvesical or transperitoneal approach should the fistula warrant

Technic

In brief the technic of repair used in these cases is as follows

1 General upbuilding regimen until patient is in good health This is an operation of election—not emergency—and even though the patient is anxious to be cured attention to general health is apt to be well-rewarded

2 Local hygiene Mild warm antiseptic douches and local treatment are advocated in order that the tissues may be in healthy condition before repair is undertaken

3 Urinary antisepsis

4 Careful localization of fistula Cystoscopic examination is always made when possible It helps locate ureters and informs the physician how far he may safely go in his dissection

Operation

1 Inverted Trendelenburg position In our experience this has been most useful It permits the operator to look down upon the operative site

2 Mobilization of vaginal mucous membrane and bladder base at site of fistula Probably this calls for more judgment than any other step in the repair When there is little scarring and the blood supply is good, wide dissection is desirable as it permits closure without tension. When badly scarred, however, wide dissection may be inadvisable because of the poorly vascularized tissues and the danger of slough In these cases, use remote mobilization

3 Inversion of the bladder and eversion of vaginal mucous membrane, using only a few interrupted fine chromic sutures [1] Over use of suture material is unnecessary and a common cause of failure

Postoperative Care

1 Prone position on well-padded frame

2 Indwelling catheter, acetic acid one-quarter per cent, irrigations three times daily or oftener if necessary With the patient in the prone position, constant gross wetting of the operative site is less likely to occur

3 Normal fluid intake (any clear liquid)

4 Patient is taken off frame and placed on her back in bed on the tenth day The catheter is removed on the twelfth postoperative day

The above outlined technic represents

the one which we have come to prefer and we believe our results justify its continued general use Ninety per cent of patients operated by us by this method have healed by primary intention following a single operation There are times, however, when variation may prove wise and as previously stated we would not hesitate to use another technic in a given case if, by so doing, we might offer a better prognosis

Better obstetrics and better surgery will reduce, but not entirely prevent, the occurrence of fistulae For those that do occur, careful evaluation and premeditated planning are fundamental Let there be no attempts at repair without meticulous preparation and a full understanding of the problem presented and its remedy

FIRST INTERNATIONAL HEALTH BROADCAST

Leading British and American physicians, 6,000 miles apart, will confer via the radio on the greatest menace to child health, rheumatic heart disease This conference, the first international broadcast on any health problem, will be heard over the National Broadcasting Company, WEAF and the Red Network, on Monday evening, May 2, at seven-thirty o'clock, Eastern Daylight Saving Time. Arranged by the American Heart Association, New York City, the conference-broadcast will observe National Child Health Day

Lord Thomas Jeeves Horder, physician-in-ordinary to the King of England, will open the conference, speaking from London Dr Homer F Swift of the Rockefeller Institute, New York City, and Dr T Duckett Jones of the House of the Good Samaritan, Boston, will then speak from Atlantic City where they will be attending the convention of the American Society for Clinical Investigation

Dr William J Kerr, President of the American Heart Association, will take up the discussion from San Francisco Rheumatic heart disease is now recognized as the deadliest and most crippling affliction of children of school age. Its annual mortality rate is seven times that of dread infantile paralysis during an epidemic, while every year it invisibly cripples thousands more. Close to a million persons in the United States have hearts damaged by rheumatic fever

Lord Horder's aerial report will dwell upon public health aspects of the disease, particularly in England Dr Kerr, from the West Coast, will tell of the work of the American Heart Association in this field The radio audience will then be carried back to Atlantic City to hear Dr Swift describe the medical investigations being carried on to isolate the cause of the disease Dr Jones will follow with a discussion of the treatment of children with crippled hearts, emphasizing the need for long continued sanatorial care

GOLFERS!! ATTENTION

The American Medical Golfing Association's Twenty-Fourth Annual Golf Tournament will be held in San Francisco, California, on June 13, at the San Francisco Golf and Country Club

The San Francisco Golf Committee, appointed by General Chairman Howard Morrow, is composed of James W Morgan, Chairman, Ernest D Chipman, George A Gray, George McClure, and William G Moore.

Drs James Eaves and Walter Schaller, past presidents of the A. M G A., are Honorary Members of the committee.

A "Golfers Special" to the A M A Meeting is being sponsored by the American Medical Golfing Association Six games of golf have been arranged on the trip to the Coast, in New Orleans, Houston, Galveston, San Antonio, Los Angeles, and Del Monte, and three on the return journey thru Portland, Seattle, Vancouver, Lake Louise, and Banff

Non-golfers as well as golfers, and their ladies, are welcome on the "Golfers Special"

For full particulars on the A M G A Tournament or the "Golfers Special," write the President of the A M G A., Dr Walt P Conway, 1723 Pacific Avenue, Atlantic City, N J , or Bill Burns, Executive Secretary, 2020 Olds Tower, Lansing, Mich

MENTAL GROWTH IN EPILEPTIC CHILDREN

I NEWTON KUGELMASS, M D and LOUISE E POULL, PH D, *New York City*
From the New York City Children's Hospital

Whatever the intellectual endowment of an epileptic child his mental growth is retarded more often than accelerated This clinical dictum raises several questions regarding the mechanism of the disease significant in developmental supervision

1 Does mental deterioration form a part of epilepsy?
2 Does initial intelligence determine the altered mental state?
3 Does reduction in the number of seizures raise mental capacity?
4 Does improvement in epilepsy enhance mental control?
5 Does age condition change in mental status?

The answers were tentatively obtained from clinical and psychological studies of 129 epileptic children selected from about 1700 institutionalized children and ninety-one from private practice studied in hospitals and special schools

Distribution of Cases

The *diagnosis* of epilepsy was concluded from detailed physical, neurological, and psychological examinations of the patient It included the medical and personal history, mental tests, blood and spinal fluid analysis, basal metabolic determinations, x-ray examination of the skull and gastrointestinal tract, allergy tests, and ventriculography as indicated

The epileptic children included in this study fulfilled the following conditions (1) Reliable psychological examinations at the beginning and at the end of the interval involved, (2) Absence of complications affecting mental status, (3) Mental levels over an I Q 20, (4) Uniform therapeutic procedures, (5) Identical living conditions

The patients were classified as primary if idiopathic epilepsy was the sole disturbance, and as secondary if, besides epilepsy, there was a constant cerebrogenic factor superimposed on the mental status In the former group mental growth might be expected to be accelerated and in the latter, to be retarded The children were considered improved if both the number and intensity of the seizures decreased, and unimproved if either the number increased and the intensity of the attacks decreased and vice versa or if there was no change in the condition during the interval of study

The *treatment* was formulated according to individual needs In the children with I Q less than 90 it consisted of phenobarbital limitation of fluid and salt, bowel regulation, and daily rest periods In the children with I Q more than 90, treatment consisted of ketogenic diet (acid-forming and dehydrating), phenobarbital, removal of physical and mental strains, elimination of allergic offense, change in environment, correction of physical defects, posture, constipation, rest periods before and after meals, and regulated daily regimen

Age at Onset of Epilepsy

Exact determination of the beginning of epilepsy is frequently very difficult because no adequate method of distinguishing epileptic seizures from nonepileptic convulsions of infancy and early childhood has been devised The general trend of the data is significant in that in most of the children studied, the seizures began in the preschool period The age of onset of seizures in the primary improved group is slightly higher than the unimproved, but the greater variability in the improved group offsets this difference Omitting a few outstanding cases the range of onset of convulsions is from birth to fifteen years, twenty-five percentile at about one year, fifty percentile at about three years, and seventy-five percentile below twelve years The similarity in these distributions again gives a negative answer to this question

I Q Determinations

The constancy of relative mental ability is most commonly expressed by the intelligence ratio Terman, Rugg, Garrison, and

others have shown surprisingly constant relative abilities of children tested year after year under normal conditions Hence the increase in mental age of a child which is expected after a given interval will depend partly on this interval and partly on the I Q The mental age of a child whose I Q is 100 will in twelve months increase one hundred per cent whereas that of a child with I Q of 50 will in the same time increase only by fifty per cent or by six months The ratio of the actual increase to this expected increase gives a measure of the stability of intelligence If it is unity, mental development is normal, if less than one, retardation, if zero, stagnation This involves two assumptions that the score units are equal at all levels of the test, which is doubtful and that the selection of children at each age is the same, also doubtful Nevertheless we have resorted to mental tests as the best first approach to our problem

The initial and final tests used in the mental studies of epileptic children involved a variety of scales The final rating was a weighed average of appropriate

measures The Stanford-Binet was supplemented by the Pintner, Paterson Performance Scale, Kelley Traube Language Completion, Parteus Maze or Pintner Non-Language Not all the scales were used in each case for choice depended on the clinical needs of the individual The Kuhlmann-Binet was substituted for the Stanford-Binet in most cases below the five-year level Scales requiring the use of language were omitted in cases of marked speech defect or foreign language background The I Q in children of fifteen years of age or over was determined by dividing the mental age by 180 months, as fifteen years is the accepted maturity level

The *hospitalized group* of epileptic children is retarded mentally As selected cases their mental status is in accord with the observations recorded for institutional epileptics [1 3] No significant difference appears between primary and secondary types of epilepsy in these children, and both are within mental range of the unselected children in the hospital that are mentally retarded But there is some difference in I Q in favor of the improved group of children as compared with the unimproved, treated or untreated

The *private practice group* of epileptic children showed a normal mental rating significantly higher in the improved than in the unimproved patients It corresponds well with the central tendency and total range of other pediatric patients Other observers [4] record slightly lower I Q values for the mentally normal epileptic children On the other hand, we have seen many epileptic children superior in intelligence when tested early in the course of the disease, especially those who have had only petit mal attacks Apparently the large number of mentally retarded epileptics observed in the institutional group is statistically balanced by a greater number of cases above average intelligence in the private practice group The selected nature of the groups studied by various investigators however precludes strict comparisons

Mental Growth in Epileptic Children

The I Q changes on retests were determined for each group of children, institutionalized and private practice Test conditions were favorable to the best response No data was recorded for children under the immediate influence of seizures The retests therefore indicate the effects of the disease, treated or untreated, on mental status The intervals between the initial and final tests varied from three months to three years but the results are valid for comparison since the correlation with interval change was negligible $+ 0.105 \pm 0.12$ But the correlation between the first and final tests was $+ 0.90$

The accompanying histograms* and Table IV reveal a constant difference between the improved and unimproved groups, irrespective of the initial I Q, at the lower end of the distribution This indicates that whereas both improved and unimproved are limited alike in their tendency to raise their mental status, the unimproved as a group drop twice as low at the seventy-five percentile of the distribution Mental deterioration was thus prevented by treatment in both institutional and private practice groups The histograms of the two improved groups show no tendency to a large drop at the lower end of the distribution Mental deterioration in the unimproved group appeared to be augmented by the severity, frequency, early onset, and duration of attacks

The epileptic children cured of their seizures showed a constancy of I Q and less variability than the other groups But the difference might disappear if the number of cases were increased Again, any difference less than 5 I Q is within the probable error or natural variability of the I Q itself and is, therefore, not highly significant

Brighter subjects show a slight tendency to greater deterioration ($r = -.286 \pm .07$) The younger children, however, are somewhat brighter than the older ones

*The histogram is a convenient method of representing the frequency distribution of the data The assumption is made that all of the scores within an interval of abscissae are spread uniformly over the entire interval For this reason, the measures are represented by a rectangle constructed with a base equal to the length of the abscissa and altitude equal to the number of measures within the interval. The total frequency is represented by the area of the histogram and the area of each rectangle is directly proportional to the number of measures in the interval

($r = -.144 \pm .08$) hence the rise in I Q cannot be ascribed to age alone This factor further complicated by the question of greater variability in higher and lower intelligence levels of other than epileptics The differences in the distributions according to the first I Q are too small to give indications of advantage to any group—improved or unimproved, primary or secondary

Younger patients respond to treatment more favorably than older children And the earlier it was instituted the greater its effectiveness Nevertheless the degree of change in mental status is conditioned slightly in favor of the older subjects The correlation ($r = +.0215 \pm .07$) is however too low to have great significance

Our groups do not show the degree of deterioration observed by others,[5 6] and the improved groups at any I Q level showed the minimal, if any, mental deterioration Despite the difference in treatment between the two groups the children whose seizures were diminished or arrested showed normal mental growth The dominance of drug therapy in the institutional and dietary therapy in the private practice group did not alter the mental status on improvement. Apparently epileptic children, irrespective of their mental endowment, deteriorate with the progress of the disease if unimproved by treatment

The changes in mental control were evaluated from clinical judgments of behavior It included emotional and nervous stability in ward and school relationships The percentages thus derived show no significant differences in the two groups Life is very difficult for these children Much that is attributed to underlying temperament can be assigned to chronic invalidism Mental sluggishness may be the outcome of drugs and a narrowed horizon of activity, emotional imbalance a consequence of unrealizable aims Many rise superior to their inferiority, do their school work, never enter institutions and betray no sign of affective instability or intellectual deficit

Summary

1 Clinical and psychological studies were made of 129 epileptic children selected from about 1700 institutionalized children and of ninety-one from private practice selected from hospitals and special schools The children were classified

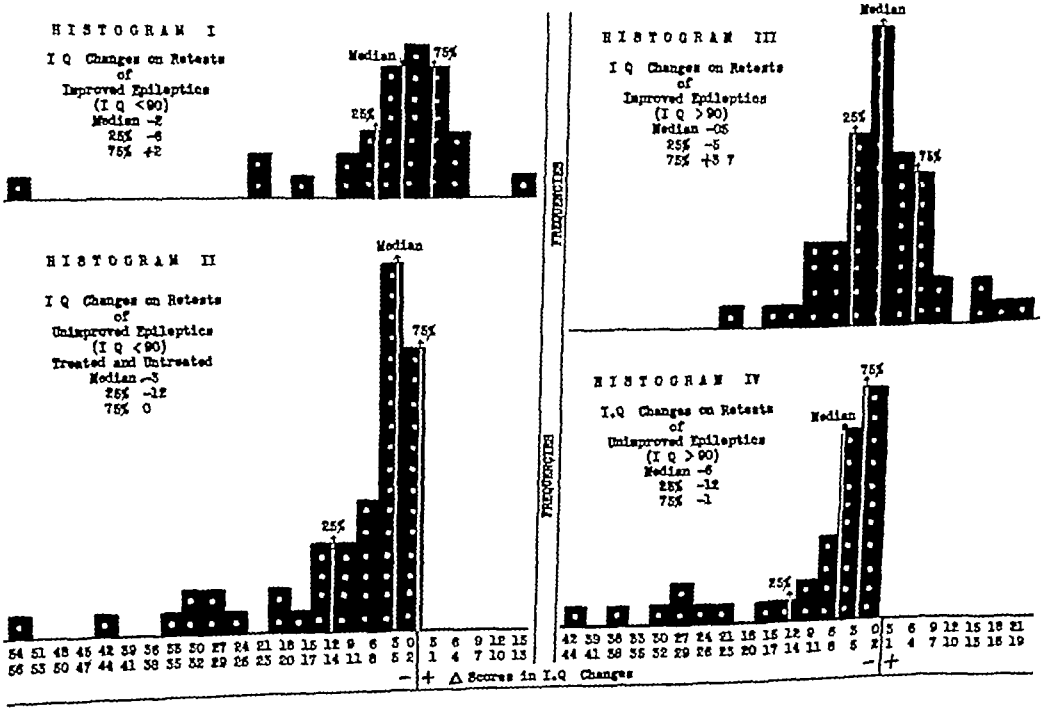

TABLE V—MENTAL CONTROL IN EPILEPTICS

	Improved		Unimproved (Treated and Untreated)	
Changes	Primary	Secondary	Primary	Secondary
Better	22%	21%	15%	22%
Same	41%	58%	47%	45%
Worse	37%	21%	38%	33%

TABLE VI—CORRELATIONS

Factors		Cases (Primary)	Correlation
Chronological Age	I Q Changes	87	+0 215 ±0 07
Initial I Q	I Q Changes	87	−0 256 ±0 07
Chronological Age	Initial I Q	87	−0 144 ±0 08
Testing Intervals	I Q Changes	32	+0 105 ±0 12
Testing Intervals	I Q Changes	55	+0 127 ±0 07

as primary if idiopathic epilepsy was the sole disturbance, and as secondary if besides epilepsy there was a constant cerebrogenic factor superimposed on the mental status The children were considered improved if either or both the number and intensity of the seizures diminished and unimproved, if either or both of these conditions did not ensue from treatment or nontreatment The mental tests involved a variety of appropriate scales, a weighed average of which constituted the final rating for each child

2 The institutionalized group of epileptic children is retarded mentally but within the range of the hospitalized unselected children The private practice group of epileptic children show a mental rating significantly higher in the improved than in the unimproved patients The large number of mentally retarded epileptics observed in the institutionalized group is statistically balanced by a greater number of cases above average intelligence in the private practice group

3 Histograms of retests reveal a constant difference between the improved and unimproved groups irrespective of the initial I Q The unimproved group drop twice as low in the seventy-five percentile and shows a large drop at the lower end of the distribution Mental deterioration is thus prevented by treatment in both institutionalized and private practice groups The changes in mental control within various intervals show no significant difference between the two groups

DANGER SPOTS IN DIPHTHERIA CONTROL

Although diphtheria cases and deaths continue to decrease in upstate New York, the 1937 immunization reports show that there is a need for communities to stress preventive treatment among children if this decrease is to be continued, according to Dr Edward S Godfrey, Jr, State Commissioner of Health "At least thirty-five per cent of children under five years of age immunized is considered necessary to give any community reasonable assurance that diphtheria will not become epidemic," he said.

Of the sixty-eight communities listed in Dr Godfrey's report, forty-eight have reported thirty-five per cent or more of children under five years of age immunized against diphtheria as of January 1, 1938 The number of the same group of communities with similar records as of January 1, 1937 and January 1, 1936 was in each case fifty-three. The percentages are based on populations estimated on the basis of births and deaths as of January 1, 1937

"Only twenty-six communities of the sixty-eight listed showed increases over the previous year in the proportion of children immunized, while forty-one showed decreases and one remained unchanged," Dr Godfrey said. "Two of the fifteen municipalities had succeeded in bringing their percentages up to thirty-five or more by January 1, 1938, leaving thirteen which had not. To these were added as of January 1, 1938, seven municipalities which previously had reached the thirty-five per cent mark, but failed to maintain it These twenty municipalities should make every effort to raise their low diphtheria immunization status to a satisfactory protective level

Places reporting less than thirty-five per cent are as follows Jamestown, Saratoga Springs, Gloversville, Lockport, Massena, Hornell, Rockville Centre, Oneonta, Dunkirk, Rensselaer, Fulton, Oneida, Glen Cove, Hempstead, Oswego, Freeport Lynbrook, Valley Stream, Watervliet, and Floral Park.

INTRACAPSULAR EXTRACTION OF CATARACT WITH IRIDOTOMY

Report of 100 Successive Cases with the Capsule Forceps

FRANKLIN BRACKEN, M D, *New York City*

Although ophthalmologists are not in accord as to detail of technic, most will agree that the completed simple intracapsular extraction preserving the functions of the sphincter iridis is superior to any other type of cataract operation The undisfigured eye and absence of glare which accompany the small round centrally placed pupil are matters of considerable moment to the patient While the procedure is slightly more complicated and requires more training and experience than the extracapsular, the advantage which it offers should not be withheld from the patient whose eye is suited to the operation

Among the operators of great experience, slight differences of opinion prevail regarding types of cataract adaptable to the intracapsular operation Colonel Wright,[1] of Madras, prefers not to do the intracapsular on persons under fifty years of age, excludes myopes of over five diopters, also excludes juvenile, unilateral, morgagnian and intumescent cataracts Knapp,[2] in his Combined Intracapsular, states that patients under fifty are usually excluded, and that the operation is contraindicated when the eyes are prominent and when there is complication due to vitreous disturbance (myopic eyes, soft eyes, and cyclitic eyes) Professor Elschnig[3] states that the simple intracapsular extraction is much superior to the extracapsular in respect to all complications Vitreous prolapse in myopic cases was doubly as frequent in the extracapsular as in the intracapsular King[4] reports in his observations at the Elschnig Clinic, that of 129 cases of simple intracapsular extraction, seventeen were between the ages of thirty and fifty, and seven were of the intumescent type. He also reported a number of simple intracapsular extractions in complicated cataracts

In this series of one hundred cases, the ages ranged from thirty-two to eighty-one, fifty-one per cent were less than sixty years of age and twenty-eight per cent were under fifty The types of cataracts were hypermature, nine, mature, twenty-four, intumescent, seven, immature, nuclear, and posterior cortical, thirty-nine, immature posterior cortical, seventeen, morgagnian, three, and traumatic, one (Table I)

For convenience of description I am dividing the details of the procedure into five steps

Preparation Sufficient sedative is administered the evening before and the day of operation to allay all nervousness, and maximum dilation of the pupil without the use of atropine is sought The O'Brien[5] block is employed for akinesis and one to two c c of two per cent novocain is injected back beneath the external rectus into the region of the ciliary ganglion A suture is passed through the superior rectus at its insertion and 5 c c of novocain injected deeply into this muscle

Section The incision is sclerolimbal with a conjunctival flap, and if not sufficient is enlarged to about one hundred and eighty degrees At this point two corneoscleral sutures are inserted in the meridians of ten thirty and one thirty o'clock, tied loosely and the interincisional portions pulled out into loops to allow free opening of the wound for passage of the cataract.

Iridotomy The conjunctival flap is grasped lifting forward the upper part of the corneal section, and with blunt-pointed DeWecker scissors held in reverse fashion, a small fold of iris two to three mm in breadth is pinched up and snipped close to the scleral edge of the section, which gives a horizontal opening that will later appear just behind the limbus This procedure is much more simple than a peripheric iridectomy, gives a uniform opening uniformly placed, and in my experience has never caused the patient to wince or show any evidence of pain

Dislocation and delivery of the lens

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

The assistant now raises the speculum off the eyeball and holds it thus until the lens is delivered and the sutures tied With the Kalt forceps, the lens capsule is grasped down behind the iris as near the equator as possible, and with traction on the lens the point of the Smith hook is pressed firmly back on the limbus directly below the capsule forceps As the zonule begins to rupture the hook is pressed firmly back and forth along the limbus below causing the lower edge of the lens to present in the pupil Gentle traction with the forceps is maintained guiding the lens in the maneuver of tumbling through the pupil, but this traction must be very gentle lest the torsion produced by the tumbling lens rupture the capsule. The hook is kept firmly applied to the cornea just below the edge of the slowly revolving lens, actually expressing it out through the wound

Closure of the wound and dressing Immediately after delivery of the lens, the knotted sutures are drawn tight and a third suture is inserted in the conjunctiva in the midline above Should the capsule have torn, as occasionally happens if too much traction is exerted toward the end of delivery, the capsule fragments may be easily and safely removed after the sutures have been tied The pupil is now usually well-contracted, and with the iris spatula it is made certain that the periphery of the iris is not caught in the section Two per cent eserine salve is applied, and a dressing covered with bichloride vaseline is placed over the closed lids and bandaged

Postoperative Complications

Vitreous prolapse occurred in five cases In two (31 and 94) fluid vitreous flowed from the moment the section was made, but it was possible to grasp the capsules, and the lenses were removed without great vitreous loss In cases 15 and 91, there was small vitreous loss immediately following removal of the lens In the fifth (case 69) some vitreous was lost while freeing a prolapsed iris All got a vision of 20/30 or better

Iris was prolapsed in seven cases Practically all prolapses of the iris took place in restless patients In six, no suturing of the wound had been done In the seventh, due to a fright, the prolapse occurred on the fourth day at the site of one of the sutures It has been my custom, where no sutures were used, to dress the eye the day following the operation When a prolapsed iris is found as early as this, it can often be freed and replaced, but I have discovered that the iris tends to prolapse again unless a peripheric iridectomy is done at the site of the prolapse

Postoperative hemorrhage occurred in eleven cases, several as late as one week after operation. Six were inconsequential, but four were large enough to fill the chamber, elevate the tension and open the wound, but the blood absorbed rapidly causing no damage One case (77) with an indefinite history of hemophilia, had hemorrhages daily for a period of ten days, which left deep staining of the cornea and dense clouds in the vitreous, so dense that for a period of three or four months his projection was faulty During the course of thirteen months this has almost entirely cleared and vision is now 20/20— Recently, upon operating this man's second eye, I gave him forty-five gr of calcium lactate daily for a period of two weeks before operation, and whether or not this made the great difference, the operation on the second eye was without incident, and vision is 20/20+ (Second eye not included in this series)

Detachment of the choroid was noted in three cases, two were of short duration, but in the third (37) the hypotony was marked The iris was applied to the posterior corneal surface for three weeks and upon restoration of the chamber, central anterior synechia had formed

Iritis, postoperative inflammations or inflamed eyes were infrequent Iritis, causing slight adhesions, occurred in three cases One (79) was a diabetic patient who also had a diabetic retinitis She obtained a vision of 20/50 The second was the emaciated old gentleman who had the more obstinate detachment of the choroid (case 37) The pupillary margin of his iris became attached to Decements membrane but was easily detached later with the back of a knife needle, with a resulting vision of 20/20— The third case (89) was one of the more severe cases of postoperative hemorrhage Her eye cleared with insignificant adhesions to the hyaloid, and vision is 20/20 Each case of extensive hemorrhage had some iritic inflammation but usually slight and of short duration The one complication to which I found the simple intracapsular procedure more vulnerable was postoperative prolapse of the iris, but this of late

TABLE I

No	Age	Cataract	Complications	Vision	
1	49	Intumescent		20/20

has been almost eliminated by inserting the sutures into the more solid structures of the cornea and sclera. I am convinced that, in spite of the additional time and labor consumed in inserting sutures, they prove a definite safeguard to the patient's eye as well as a great comfort to the operator Prolapse of vitreous has been so slight and infrequent that I would not consider it a hazard peculiar to this procedure

Summary

Group	Vision obtained	No Cases
1	20/15	16
2.	20/20	46
3	20/20- to 20/30	16
4	20/30- to 20/40	12
5	20/40- to 20/50	3
6	20/70	1
7	20/200	3
8.	10/200	1
9	4/200	1
10	L.P	2

Group four includes a patient included in group ten This man, eighty years of age, had 20/30 vision for four weeks after his operation, when he had an embolism of the central retinal artery which reduced his vision to light perception This group also includes five cases of high myopia (12 to 20 D), two of maculae corneae, two, chorioretinitis, one, opacities of the vitreous and one, high astigmatism following late rupture of the wound

Group five Diabetic retinitis, chorioretinitis, and arteriosclerosis of retinal vessels

Group six This person was illiterate and uncooperative, may have been able to see more.

Group seven Two had optic atrophy and arteriosclerosis, one was amblyopic (squinting eye)

Group eight Retinitis circinata.

Group nine Chorioretinitis

Group ten The second case was that of a patient who struck her eye on the eighth day after operation rupturing the wound and causing a large hemorrhage with prolapse of iris beneath the flap, tension developed but she refused further surgery

Contrary to some opinions expressed in the literature, I have found that presenile cataracts admit of this procedure exceptionally well The conditions which bring about the pathological changes in the posterior cortex must greatly weaken the suspensory In the age group below fifty, I have been able to grasp with the capsule forceps, dislocate and successfully remove, a higher percentage of cases than in any similar group Friability of the zonule increases with the age of the cataractous process but not necessarily with the age of the patient Many lenses with thin posterior cortical opacities which reduce vision below capacity for work, may, with reasonable care, be removed much earlier intracapsularly

While some look upon the simple intracapsular procedure as too dangerous or radical, I believe, with proper care, it does not subject the eye to as great a

risk in the case of weakened zonule as does the expression of the nucleus and cortex in the capsulotomy The intact iris is a definite stop-gap to the vitreous and may often be instrumental in retracting vitreous strands from incarceration in the wound

Given a reasonable patient, the method of traction and expression is little, if any more hazardous than the capsulotomy when this procedure is considered through to the possibility of a needling of a secondary cataract

Discussion

Dr Thurber Le Win, *Buffalo*—The subject of cataract extraction is an old one To be of value today, anything written must show a new approach or method with numerous proven cases Dr Bracken's paper has apparently met this requirement

There can be little doubt that the procedure he outlined is more difficult, but it seems equally true that his results have justified it. What we are after in these cases are useful eyes, and if this is accomplished with less disfiguration, it is a step in advance, just as the combined extraction was over the older two-stage method with preliminary iridectomy But it must be remembered that even the very much older procedures must be the ones of preference in certain cases I feel that caution must be advised in attempting the method today outlined in most myopes, in all diabetics, and in many complicated cataracts There are surely enough other cases to operate which will eventually prove or disprove this method in a fair way to the procedure and a safe way to the patient

Dr Bracken mentioned two things I would ponder over One is his third stitch in the conjunctiva If a good conjunctival flap is obtained, this extra suture is of little value He only speaks of atropine to say maximum dilation is obtained before operation without it. I would ask him when does he begin its use The O'Brien block is only safe, in my opinion, when a suture is placed in the central upper lid in the skin margin After the operation is completed the lid is closed by fastening this suture to the lower lid or cheek with a piece of adhesive or some similar method of being sure the lids are closed More than one result has been disappointing because the lids remained open afterward A suture is easily placed, is painless, and usually comes out about the fourth or fifth day when it is no longer required

Jackson says cataract extraction seriously disturbs the nutrition of the eyeball Would this be influenced by whether an iridectomy or an iridotomy were done? He further states that this disturbance may be a factor in later degenerations or infections

Dr. Lawrence E Henderson, *Watertown*—Dr Bracken has reported an interesting series of cases and is to be congratulated upon the results he has obtained. Those of us practicing in the smaller centers where our results are more quickly known, find ourselves frequently perplexed with the problem of which operation will give our patient the best visual result with the smallest amount of risk For the past few years the trend is certainly toward the intracapsular operation The matter of preserving a round pupil, we find, makes the operation little if any more difficult or hazardous, and in doing the intracapsular operation peripheral iridotomy we feel that the following advantages are offered

1 A better looking eye (particularly appreciated by women who object to the appearance of the coloboma which is magnified by the strong plus lens)

2 Less glare than when an iridectomy is done, and less confusion if the unoperated eye is still to be used

3 Less trauma, therefore comparatively little postoperative reaction and the number of days in the hospital often reduced by two or three

4 Better vision much sooner than with capsulotomy in the event that cortical material must be absorbed and possibly discission of an obstructing secondary membrane.

5 Immature cataracts may be operated avoiding a long wait which greatly disturbs an apprehensive patient and is often of economic importance.

The technic we employ is similar to that described by Dr Bracken I personally have used only the capsule forceps My associate (Dr Atkinson) had some experience with the erisophake a few years ago, but discarded it feeling that it was an unsafe procedure in the hands of the occasional operator We shall try electrocoagulation only after others have proved to us that it is a safer and better method

Complete anesthesia is no doubt one of the most important factors in the success and safety of the operation Instill-

pontocaine four times at one to two minute intervals gives us adequate anesthesia of the cornea and conjunctiva We secure temporary paralysis of the orbicularis by the O'Brien method—complete anesthesia of the globe and paresis of the recti muscles, by the *cone* injection, as described recently by Dr Atkinson A suture under the superior rectus with only a very little traction by the assistant holds the eye in perfect position and we have no fear of the patient moving the eye. He is never conscious of the iridotomy or the iridectomy, if it is necessary to perform one

The iridotomy is made with DeWecker scissors before the extraction of the lens If the patient is very old and the iris atrophic, or should he be extremely nervous, we make two or three iridotomies about three mm apart A loupé attachment to the operating glasses greatly aids in the proper execution of the iridotomy I was recently persuaded to operate a woman of eighty-two with senile dementia who had been unable to see for six months or more Two iridotomies were made Within a few hours after operation, she developed a delirium which necessitated constant watching and often mild restraint for the following fourteen days, but the iris did not prolapse and the pupil remained round and central Her mental state improved markedly when a plus ten lens was fitted for temporary use.

We have better luck with the Elschnig than with the Kalt forceps, but occasionally when the capsule is a little tight the Kalt works better It is a good plan to slide the forceps in from the side rather than from above to avoid the possibility of passing it through the iridotomy opening If the pupil is not widely dilated, a subconjunctival of cocaine one per cent with adrenalin injected below will cause the pupil to widen more below, permitting an easier delivery and leaving a curtain of iris above to hold back the vitreous

Dr Bracken uses eserine ointment two per cent to quickly restore a small pupil We have found one-fourth per cent quite satisfactory, and have often thought that the discomfort sometimes complained of for an hour or so upon being returned to bed may be due to the action of the eserine

Comparing the visions of our intracapsular cases, I find that we have more with 20/20 or better in those with iridotomy than those with iridectomy Time does not permit a discussion of the postoperative complications Dr Bracken is to be commended for his frank and honest presentation of that phase of his subject

PROGRESS OF FOOD AND DRUG LAWS

Legislation increasing the powers of the Federal Trade Commission over advertising of food, drugs and cosmetics won approval of the Senate and went to the White House on March 14

Senator Wheeler, Democrat, of Montana, said, "this is one of the greatest steps toward the elimination of unfair practices that has ever been taken by Congress"

The Montanan said that previously the Federal agency could act only when firms injured competitors, whereas the new bill covered "injury to the public."

On March 15 the House Interstate Commerce Committee favorably reported a revised pure food and drug bill and voted to seek action at this session of Congress

The bill is a revision of the Copeland measure approved previously by the Senate If enacted, it will be the first important revision of the food and drug laws since 1907

It would tighten provisions of the existing law and broaden its scope to include the five billion dollar a year cosmetic industry, new therapeutic devices, fat reducing drugs and all patent medicines

Provisions were expanded in the bill to give the food and drug administration power to seek injunctions in Federal courts against violators and right to seize misbranded articles if the product is dangerous to health

The bill also would set up a single standard quality for each food

Fifty-five pathologists in Albany on February 26 voted to organize the New York State Society of Pathologists A committee was elected to draw up a constitution to be presented for adoption at the next meeting to be held in New York City at the same time as the annual meeting of the State Medical Society

The committee for the formation of the constitution consists of the following A V St. George, chairman, Louis R Ferraro, M E Marten, Solomon Weintraub, Stephen Curtis, Ward H Cook, W S Thomas Herbert R. Brown, and M J Fein, the acting secretary of the proposed organization

LYMPHOGRANULOMA VENEREUM

The Present Status

DAVID BLOOM, M D, *New York City*

From the Departments of Dermatology and Syphilology of Bellevue Hospital and New York University College of Medicine (Services of Drs Howard Fox and Edward R Maloney)

This paper is based on reports from a vast world literature and from personal observation of more than 100 cases of lymphogranuloma venereum in the Division of Dermatology and Syphilology at Bellevue Hospital in the course of the last few years I shall omit the interesting history of this disease and the usual clinical features which have been so often described I shall confine myself to important observations the knowledge of which will give a better insight into this disease

Incidence

The appearance of a few articles on lymphogranuloma venereum in the United States a few years ago resulted in an increasing number of reports of cases and investigations in the last few years This indicates the importance of the disease in regard to its frequency and seriousness

An enormous increase of patients with lymphogranuloma venereum (both inguinal and rectal types) has been reported in the last few years from many hospitals in Europe For instance, according to Sézary and Drain[1] in 1929-30 very few cases were hospitalized in Paris Since 1931 there were always from four to ten cases under observation of the authors in the wards of their hospitals From 1931 to 1934 1190 cases of lymphogranuloma venereum were treated in the hospitals of Bucharest[2] This incidence was the result of a progressively advancing increase in cases since 1922 From my series (Table I) one may see the increase in cases at Bellevue Hospital Hardly a week passes without seeing a new case of the inguinal or rectal type of lymphogranuloma venereum and there are always several such cases in our wards The greater incidence of lymphogranuloma venereum in the last few years is probably not due to an actual increase in the number of cases but to a better knowledge of the symptoms of this disease The history of lymphogranuloma venereum shows that it has existed for many decades I wish to mention as an example the report of Klotz[3] who as far back as 1890 described 120 patients with inguinal adenitis of the lymphogranuloma venereum type which he had observed within ten years More than 100 cases which have been under my personal observation in the last few years were probably only half of the cases in the entire hospital and which were not referred to our service partly because they were not recognized as lymphogranuloma venereum The number of patients with lymphogranuloma venereum in various hospitals in New York and other cities must be very considerable

Clinical Aspects of Lymphogranuloma Venereum Primary Lesion, Chronic Genital Ulcer

While the primary lesion of lymphogranuloma venereum is usually evanescent and herpetiform in appearance it may sometimes persist as an ulceration for weeks or months and particularly in women, serve as a source of transmission This has been observed by many authors Examination of an ulcerative lesion in the genital tract should consist therefore not only of a dark-field examination for Spirocheta pallida, a search for Ducrey bacilli and the use of Ducrey vaccine, but lymphogranuloma venereum should also be considered and a Frei test performed The lymphogranuloma venereum chancre seems to develop frequently intraurethrally for there is often discharge from the urethra present which is free from gonococci Loehe[4] has endoscoped the urethra in such cases and has found a circumscribed infiltrated erosion of the

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

mucous membrane of the anterior portion of the urethral canal Here also the primary lesion may change to a chronic ulcer and lead to stricture of the urethra Gray[5] reported eleven such cases in women The primary lesion on the tongue in the case which was reported separately by Curth[6] and Bloom[7] might be well-explained in this way

Nicolau[8] reports a case of ulceration of the penis which four years previously started from an insignificant ulceration on the side of the glans Lymphogranuloma venereum was proven by histologic examination, a positive Frei test, and by demonstration of specific antigenic properties from the serum of the antigen

TABLE I—CLASSIFICATION

	Inguinal		*Rectal*		*Extra Genital*		
	Male	*Female*	*Male*	*Female*	*Male*	*Female*	*To*
White	33	1	11	2	1	0	48
Colored	27	3	8	21	0	0	59
Total	60	4	19	23	1	0	107

Nicolau[2] and others believe that chronic vaginal ulcer constitutes the most common source of contamination and it is highly important that such an ulcer should be discovered early and the patient hospitalized until the lesion has entirely disappeared

Inguinal Adenitis

The course of inguinal bubo in lymphogranuloma venereum may vary considerably according to the case Some patients hardly notice any enlargement, in others adenitis undergoes involution in a few weeks, still others are very ill and confined to bed for weeks or months The typical picture of lymphogranuloma venereum bubo however is a firm indurated tumor attached to the underlying tissues and with a tendency to soften later in areas and to produce sinuses

I have observed several cases in which, besides the indurated mass in the inguinal region, there was an extension of the induration and infiltration to the pubic region, the corresponding lower abdominal wall, and the subcutaneous tissues of the thighs

Such cases have been described by Favre[9] On histologic examination he found disappearance of subcutaneous fat, formation of dense new connective tissue, infiltration of lymphocytes, fibroblasts, and connective tissue cells of the character of histocytes There was also marked obliteration of blood vessels Constitutional symptoms such as fever and malaise, which are frequently associated with lymphogranuloma venereum are constant and particularly severe in such cases One of these cases developed marked secondary anemia and enlarged liver and spleen

Not infrequently marked suppuration takes place in the inguinal mass resembling the behavior of chancroidal bubo

The iliac glands, which are involved in a great many cases, show tenderness on pressure in the corresponding lower abdominal quadrant This should be recognized by the physician, because appendicitis will often be diagnosed if the right side is involved—if lymphogranuloma venereum is not considered Such a diagnosis was considered by the medical consultant in one of our cases who presented typical symptoms of appendicitis

Manifest suppuration of the iliac glands, which apparently takes place very rarely, was observed in one of the cases of my series A white man, aged twenty-four, developed after subsidence of suppurating bilateral inguinal adenitis of two months duration and while under intravenous Frei antigen therapy, marked induration of the abdominal wall and a mass within the right lower abdominal cavity Several days later a considerable amount of pus was discharged through the wound of the previous bubo associated with diminution in the size of the pelvic mass I suspect that suppuration of the iliac and pelvic glands occurs more frequently than is usually supposed, resulting in fibrosis and adhesions around the pelvic organs or producing peritonitis when breaking through the peritoneum I believe that the assumption of Barthels and Biberstein[10] in 1931 that many pelvic conditions in women may be due to lymphogranuloma venereum has since been repeatedly confirmed

General Constitutional Symptoms

In the early stages of lymphogranuloma venereum, fever is a constant occurrence,

remittent in type, reaching sometimes as high as 105 to 106 but frequently 102 to 104° F Particularly those cases who show, besides the inguinal bubo, involvement of the pelvic glands and the abdominal wall may be laid up with fever for several weeks

Arthritic pains are a common occurrence They improve quickly, however, under treatment for the lymphogranuloma venereum

Many patients complain of severe headaches Haam and D'Aunoy[11] report successful transmission of the disease to mice by inoculation with the spinal fluid of two patients in the first stages of lymphogranuloma venereum who suffered from severe headaches and dizziness Recently a nineteen year old Porto Rican man was admitted to Bellevue Hospital with a temperature of 103 4° F , severe headache and stiff neck, suggesting meningitis His spinal fluid, however, was normal He had a left inguinal mass, enlarged iliac glands, and a strongly positive Frei test David and Loring[12] suggest that epileptiform seizures may be a manifestation of lymphogranuloma venereum

One should keep in mind, however, that different pathological conditions present in lymphogranuloma venereum patients may be merely coincidental without any etiologic connection I have seen at the Psychiatric Institute of Bellevue Hospital a negress who had had rectal stricture due to lymphogranuloma venereum for six years and epileptiform attacks for two years A Frei antigen prepared from the spinal fluid gave a negative reaction in other lymphogranuloma patients On operation a granulomatous tumor was found in the right frontal lobe of the brain An antigen prepared from an emulsion of the tumor produced a tiny erythematous papule in other lymphogranuloma venereum patients The same reaction, however, was produced in normal people A complete pathological examination of the tumor has not been reported yet

The above associated symptoms and the occurrence of exudative or nodular eruptions, occasional hypertrophy of the spleen and liver and generalized adenopathies indicate mobilization of the virus through the whole organism

Rectal Involvement Its Mechanism and Development

In the history of forty-two cases of rectal stricture, only one patient had a typical inguinal bubo It is assumed therefore, that involvement of the inguinal glands serves as a protection against the penetration of the virus into the pelvis beyond the iliac glands The latter are frequently enlarged but seem to contain little virus for they usually disappear without manifest suppuration

Exceptionally, however, the rectum may be involved in spite of a preceding typical inguinal adenitis I have observed two such cases who, several weeks after the onset of the inguinal and iliac adenopathy, developed ulceration in the rectum A very instructive report was given by Kornblith[13] of a patient who several weeks after development of inguinal and iliac adenitis complained of bloody discharge from the rectum and gradually developed a rectal stricture and a condylomatous tumor around the anus A similar case is reported by Sezary and his collaborators[14] in a woman who following a painful left inguinal bubo developed condylomata of the anus and soon after signs of stricture of the rectum appeared These cases show convincingly the method of development of the rectal stricture Although primary infection may take place directly in the rectum by pederasty the usual method of rectal involvement is by way of the pelvic glands, the virus extending from the primary lesion on the genitals directly to the pelvic glands This, I believe, is not only the case in women in whom the primary inoculation takes place in the vagina or cervix, the lymphatics of which drain directly into the pelvic glands, but also in men It is to be assumed that in men, in whom rectal stricture develops without preceding inguinal bubo, the virus migrates from the genitals by way of the few lymph vessels which lead directly to the pelvic glands

It is of interest that rectal involvement may consist of simple proctitis and that some cases of colitis might be due to lymphogranuloma venereum Seven out of twenty unselected cases of colitis and proctitis without stricture reacted positively to Frei antigen [15]

Extension of Lymphogranuloma Venereum to the Abdominal Organs

Involvement of the pelvic glands results not only in rectal stricture but also in parametritis and adnexitis [16] Aoyama[17] reported a case of a patient with bilateral inguinal adenitis who seventeen days after onset of illness developed suddenly severe pain in the abdomen associated with high fever When laparotomy was performed a considerable amount of dark pus was found in the abdomen with which animals were successfully inoculated Peritonitis has been observed in our series and by others Lichtenstein[18] reports death due to peritonitis in two cases and in one as a result of a perforated decubitus ulcer of the sigmoid due to impacted fecal masses above the rectal stricture The patient of Reichle and Connor[19] was a negro, aged thirty-one, who was seen two months after development of inguinal adenitis with marked fever and continued pain in the right hip A roentgenogram revealed a destructive process in the right hip joint At autopsy which took place six and a half months after the onset many adhesions were found between the abdominal organs, destruction of the right psoas muscle, and changes in the retroperitoneal chain of glands identical with those of the inguinal lymphogranuloma venereum bubo The kidneys showed granulomatous lesions and the adrenals hemorrhagic infarcts In the hip joint there was a large amount of pus and the articular cartilages were markedly eroded

The anatomical basis for the sequelae of lymphogranuloma venereum is mostly stasis due to the occlusion of the lymphatics by destruction of the lymph glands Destruction of the anorectal glands leads to stasis in the rectal walls and results in ulceration and elephantiasis and formation of fistulas which may not only be found in the vicinity of the anus but which may also involve a great part of the buttocks As a result of the destruction of the inguinal and pelvic glands, stasis takes place in the genital organs and ulceration and elephantiasis may take place there. Chronic ulceration and elephantiasis of the penis and scrotum are much rarer than those in the female genitalia The author has seen through the courtesy of Dr Howard Fox one case of elephantiasis of the penis and scrotum at the Veterans' Hospital in New York City The reaction to the Frei test which I produced with three separate antigens was strongly positive Two weeks later the patient developed pneumonia and died The necropsy revealed extensive scarring and infiltration of the rectum, with very large lymph nodes extending to the entire length of the lymphatics and the thoracic duct

Extragenital Lesions

Several cases of involvement of the axillary glands due to inoculation of the virus in the finger and of involvement of the cervical glands by abnormal sexual relation have been reported in recent years [20] Of interest is the involvement of the eyes by lymphogranuloma venereum virus Weidman and Hunter[21] presented a case of edema of the eyelids due to lymphogranuloma venereum Levaditi and his coworkers[22] report conjunctivitis with preauricular and submaxillary adenopathy Hashimoto[23] believes that Parinaud's conjunctivitis is due to lymphogranuloma venereum He reports an effective Frei antigen prepared from the discharge of the eyes Haam and Hartwell[24] report experimental conjunctivitis produced with the virus of lymphogranuloma venereum

Cutaneous Lesions

Wien and Perlstein[25] describe three types of ulceration encountered in lympogranuloma venereum—ulceration of the skin only, ulceration of the skin secondary to adenitis, and ulceration developing in esthiomene

Midana[26] described in a patient with inguinal and iliac adenopathy, cutaneous lesions resembling ecthyma on the abdomen, gluteal region, and the thighs An extract from the lesions gave a good Frei antigen

Saenz[27] reports erythema nodosum in association with lymphogranuloma venereum Wise and Sulzberger[28] mention a case of widespread erythema nodosum and erythema multiform-like eruptions I have seen one such case in a patient with persistent inguinal adenitis who developed an erythmatous nodular eruption suggesting iododerma or bromoderma

Infectiousness

Many authors agree that the period of danger of contagion is very short, probably during the presence of the primary lesion only[29] Although the presence of the virus might be proven experimentally in the secretions of the inguinal bubo or in rectal lesions, and cases of extragenital infections are reported through secretion from buboes, actual transmission in daily life seems to be rare According to Nicolau and others the most infectious lesion is the chronic vulvovaginal ulcer

Race, Sex, and Age

The greater incidence of lymphogranuloma vereneum in colored patients as compared to that of white is not due to greater susceptibility of the colored race to the virus but to the fact that venereal diseases in general are more frequent among negroes This is best proven by Haim and Matthewson[30] who reported twenty-three cases of inguinal bubo and twenty-three rectal strictures due to lymphogranuloma venereum, all in whites They too emphasize the point that frequency of lymphogranuloma venereum is more dependent on sexual hygiene than on racial susceptibility

The inguinal type is very rare among women Among 107 cases I saw inguinal involvement in one white and three colored women (Table II) This corresponds to the findings of Hellerstrom who reported 4 3 per cent of adenitis in women, to the report of Kornblith[31] of 3 4 per cent and to that of Rajam[32] whose series consists of inguinal adenitis in ninety-nine males and two females These findings are in contrast to those of other authors who found adenitis in women in sixteen to twenty per cent of their cases As to the rectal type Rajam reports eighteen males and eight females which seems contrary to the findings of other authors who saw more cases of anorectal syndrome in women than in men This coincides with our findings if we consider the Calcutta women as white For in our series only two white women had rectal involvement of which one was a Porto Rican No satisfactory explanation can be given for the apparent relative rarity of rectal stricture in white women My findings also do not accord with the usual belief that rectal stricture is preponderantly found in females for in my series there were twenty-three anorectal cases in females to nineteen in males Rajam blames the high incidence of pederasty for the high number of rectal stricture In my series very few men admitted pederasty and many vehemently denied abnormal sexual relations

I believe that there is no difference in the incidence of lymphogranuloma venereum infection between men and women in spite of the rarity of inguinal adenitis in the latter I believe that many infections of lymphogranuloma venereum result in involvement of the pelvis without involvement of the rectum The unrecognized lymphogranuloma venereum infection in cases of pelvic involvement could explain the difference of lymphogranuloma venereum incidence in men and women as reported by many authors

TABLE II—INCREASING INCIDENCE

	Inguinal	*Rectal*	*Extra Genital*	*Total*
1931	0	1	0	1
1932	1	0	1	2
1933	1	3	0	4
1934	12	11	0	23
1935	12	4	0	16
1936	29	14	0	43
1937	9	9	0	18
Total	64	42	1	107

The age is that of sexual maturity and the great majority of cases of lymphogranuloma venereum occur between the ages of twenty and forty There are however several reports of infection in children In 1935 at the combined meeting of the Dermatological Conference of the Mississippi Valley and the Central States Dermatological Society a case of bilateral inguinal adenitis was presented[33] in a ten year old negro girl who had fever and in whom a Frei test became positive on the twenty-third day after the onset of illness A case of rectal involvement was reported by Elitzak and Kornblith[34] in an eight year old Porto Rican girl whose mother had a rectal stricture due to lymphogranuloma venereum and whose father gave a history of inguinal adenitis twelve years previously The Frei test was positive in both parents It was assumed that the infection most probably took place by a rectal tip used by the

mother and employed in giving enemas to the child

Changes in the Blood

Severe secondary anemia is reported to occur in the course of lymphogranuloma venereum Three of our female patients, one with an inguinal bubo, involvement of the abdominal wall, and pelvic glands, and the two others with rectal strictures showed severe secondary anemia

Williams and Gutman[35] have reported high serum protein values in ten out of twelve cases, more marked in the advanced stages of lymphogranuloma venereum They found relative and absolute increase in the serum globulin in eleven cases They believe that hyperglobulinemia in lymphogranuloma venereum is similar to that in kala-azar, leprosy, and other chronic infections According to them hyperglobulinemia may account for the high erythrocyte sedimentation rate, the false positive and repeatedly anticomplimentary Wassermann reactions Rosen and his coworkers[36] have found total lipides, total cholesterol, cholesterol esters, and albumin below the normal average level Free cholesterol and globulin yielded above normal average results Except globulin which was always high, the other chemical changes were more accentuated in the more advanced cases of lymphogranuloma venereum These changes in the blood chemistry indicate derangement in the general metabolism of the body by the virus of lymphogranuloma venereum

Diseases Resembling Lymphogranuloma Venereum

Although the clinical picture of inguinal adenitis due to lymphogranuloma venereum is typical, one should keep his mind open to the possibility of primary tuberculosis, however rarely this may occur Woringer[37] reports a case of bilateral inguinal adenitis with fistulas which was clinically diagnosed by Pautrier as lymphogranuloma venereum Microscopic examination, however, revealed tuberculosis and a guinea pig inoculation was positive A similar case was published by Pautrier and Lanzenberg[38] This patient had in addition to inguinal adenitis a perineal fistula The Frei test was negative The histopathologic examination and the guinea pig inoculations were positive for tuberculosis Nicolas, Lebeuf, and Rougier[39] report a case of an Arab who had inguinal, iliac, and axillary adenitis with fistulas and gave a strongly positive Frei reaction The authors thought of the possibility of tuberculosis associated with lymphogranuloma vereneum but animal inoculation with the pus convinced them that the condition was due to the tubercle bacillus alone.

Favre[9] reported five cases of primary carcinomatous glands in the groin which resembled clinically lymphogranuloma venereum

As to the anorectal type it is of interest to know that ischiorectal abscess and rectal fistula are seldom tuberculous in persons clinically free of tuberculosis However, in patients with pulmonary tuberculosis, anorectal tuberculosis occurs in three to five per cent and in such patients one should try to eliminate the possibility of tuberculosis before making a diagnosis of lymphogranuloma venereum

The symptoms which are associated with rectal stricture due to lymphogranuloma venereum may also be caused by malignancy In 1934 I examined a white male, aged thirty-six, who was sent to me with a diagnosis of cylindrical stricture of the rectum with a history of difficult defecation for the past two or three years and which became worse in the last few months accompanied by bleeding As the Frei test in this patient was negative, a biopsy was performed and the microscopic examination revealed adenocarcinoma

I was also present at an operation on a twenty year old woman who had developed symptoms of a stricture a month before. In spite of the positive Frei test I disregarded the diagnosis of lymphogranuloma venereum and favored that of malignancy because the roentgenogram of the rectum which was taken following a barium enema, did not show the usual picture of stricture seen in this disease The operation confirmed the suspicion of cancer The Frei test which was repeated after the operation with a reliable antigen gave a negative reaction

Phineas Bernstein[40] reports the case of

a twenty-seven year old negress who had genitorectal involvement which was due to both carcinoma and lymphogranuloma venereum

Frei Antigen

The strength of the antigen varies with the patient from whom the pus is obtained, but usually a good antigen is only obtained from a bubo before marked suppuration takes place The pus which is later accumulated in the inguinal mass usually gives, in my experience, a weaker antigen I believe that the mouse antigen which is now obtained commercially since the successful transmission of the disease to mice by Grace[41] is a valuable aid in the management of this disease However, with the use of the mouse Frei antigen, a control test should be done with the brain emulsion of normal mice

Animal Experimentation

Of the enormous work in experimental lymphogranuloma venereum in animals carried out since the first report of Hellerstrom and Wassen[42] and later by Levaditi and his coworkers,[43] I wish to mention a few interesting findings Experimental lymphogranuloma venereum produced by intracerebral or peritoneal inoculation of mice, seems to result in a generalized infection, for the liver, spleen, kidney, and bone marrow were found to be equally virulent The inoculation period of experimental lymphogranuloma venereum becomes shorter and its seriousness greater the more the virus adapts itself in general and to one special species in particular It is of interest that inoculation in the mucous membranes of the nose and urethra in animals is negative in contrast to urethral and anal infection in men

Levaditi has shown that the blood serum of lymphogranuloma venereum patients contains specific properties that destroy the virus of lymphogranuloma venereum

The virus persists at least seventy-one days in the lymphatic glands of the monkey and at least ninety-one days in the brain of mice

The virus seems to be present not only in early lesions of lymphogranuloma venereum in men but also in the secretions of rectal lesions, although these lesions are considered to be mostly due to stasis of the lymphatic system Levaditi has inoculated monkeys successfully with tissue from the rectal stricture of a woman I have been able to produce a good Frei antigen from the secretion of a fistula from a patient with rectal stricture.

Aoyama[44] has achieved immunity to the virus in mice by repeated subcutaneous or intraperitoneal injections There is no doubt that lymphogranuloma venereum is due to a filterable virus It would be of enormous importance if one could confirm the work of Tamura[45] who reported successful cultivation of the virus by using the medium devised by Maitland for the cultivation of vaccinia He produced an antiserum which was useful in the therapy of lymphogranuloma venereum Miyagawa and his coworkers[46] reported successful intracerebral inoculations of mice with tissue culture material Coles[47] believes that he found virus bodies in pus in three out of four lymphogranuloma venereum cases which resemble the virus bodies of vaccinia, herpes, and molluscum

Treatment

In the evaluation of therapy one should keep in mind that the course of lymphogranuloma venereum may vary to a considerable degree The only certain way to learn the exact value of remedies would be to compare a series of untreated with a series of treated cases This has not been done and our evaluation of remedies in lymphogranuloma venereum is based more or less on personal impressions The fact that many remedies are mentioned and that a remedy praised by one author is found without value by another proves that so far we have not found a real specific therapy for the disease

In my experience, tartar emetic which was used in our series until about a year ago, proved a fairly satisfactory remedy and in some cases surprisingly effective, particularly in patients with rectal stricture I believe, however, that Frei antigen injected intravenously and which Dr Reuben Reider and I have employed in many cases at Bellevue Hospital in the course of the last eight months surpasses tartar emetic in effectiveness Also this mode of treatment seems to have a more

striking effect in cases of rectal involvement than in the inguinal type but still the therapeutic effect is not constant and not of equal value in every case In cases of rectal stricture which have ended in marked scarring, one does not expect relief from any remedy. In most of the cases, however, the stricture is due in large measure to edema and inflammation of the rectal walls which seems to be beneficially influenced by the treatment and makes colostomy unnecessary Again and again I have been amazed at the improvement in the general well-being of the patients, the disappearance of pain in the rectum, easier defecation, and lessening of purulent discharge In some of our cases the proctologist reported objective improvement, whereas before treatment he could not introduce the proctoscope, he could do so easily after treatment was started The Frei antigen which was used was either human or an emulsion of brain of mice infected with lymphogranuloma venereum The injections were given twice weekly starting with 0 1 c c and gradually increasing up to one c c. Patients with lymphogranuloma venereum responded with fever to this injection in contrast to nonlymphogranuloma venereum patients The intensity of the febrile reaction varied according to the effectiveness of the antigen in the intradermal test A rise of temperature of 105 to 106 may be reached, the usual rise was to 102 or 104° F The mouse antigen gave stronger and more constant reactions In most of the patients one has noticed temporary desensitization with lessening in the fever with each injection so that after a number of injections no fever at all was produced I have not noticed any cutaneous desensitization when achieving temporary intravenous desensitization

Mouse antigen seems to be of greater value because of the constancy with which stronger reactions are obtained The cost of the commercially manufactured mouse antigen is unfortunately great, the amount necessary for treatment being considerable

Radical surgery in both early and late stages is inadvisable Surgeons should keep in mind the statement of Martin[48] that operation on a rectum infiltrated with granulomatous masses in the late stage of lymphogranuloma venereum is a far greater mechanical problem than in carcinoma and that the mortality of operations exceeds that following extirpation of carcinoma

Roentgen irradiation seems to be useless if it is possible to judge from experience with two patients One with a persistent inguinal bubo was treated by me personally and the other with a rectal type of lymphogranuloma venereum was referred to me from the New York City Cancer Institute where deep roentgen therapy was administered without effect

I have frequently seen patients with inguinal bubo discharged from the hospital as markedly improved returning soon after with a marked exacerbation of the condition associated with involvement of the pelvic glands I am convinced that every patient with lymphogranuloma venereum should remain in bed until completely well In this I agree with Carol[49] who maintains that rest in bed is a most important factor in treating early cases of inguinal adenopathy In cases of rectal involvement, local conservative medical and surgical measures together with intravenous Frei antigen therapy is at present the best treatment available

Prophylaxis

As in any other venereal disease prophylaxis is the best means of attack and should be directed toward eradicating the source of infection It is most important to remember that small ulcers on the genitals of women or men may be due to lymphogranuloma venereum and that women may harbor the virus without showing any visible lesion The report of Serefis[50] is extremely interesting in this respect He tells of a small Greek island where lymphogranuloma vereneum became endemic and all cases were traced to a single prostitute who showed no external manifestations of the disease but gave a strong Frei reaction The endemic was stopped by sending this woman to the hospital

The great incidence of this disease and its most frequent occurrence in persons who visit our free clinics and hospitals makes the availability of Frei antigen, particularly in surgical and gynecological wards, extremely necessary The manufacture of human, mouse or monkey anti-

gen, should be undertaken by the hospital laboratories so that the problem of expense would be obviated

The Frei test is of no value during the stage of the primary lesion but as long as the diagnosis of lymphogranuloma venereum is under consideration the patient should be kept under strict observation like a patient with a syphilitic chancre and a negative darkfield examination, who has to be kept under observation until the Wassermann test becomes positive.

Discussion

Dr. Rudolph Ruedemann, Jr., *Albany*—The opening of the discussion on this interesting paper is a pleasure and its thoroughness leaves little to do but touch on some of the epidemiological and preventive aspects—a field in which we find ourselves becoming more and more involved and interested.

It is rather ironical that when I was diagnostically asleep I saw many patients with chancroidal infection and possibly lymphogranuloma venereum Now when I am cognizant of this clinical entity I am in a community where few chancroidal lesions and patients with lymphogranuloma venereum are seen

In the period from 1921-1926 when I was in Huntington, W Va, a city half the size of Albany, a surprisingly large number of patients with buboes and chancroids passed thru the urological clinic and city clinic. Some of these patients are stamped indelibly upon my memory because of the diagnostic and therapeutic difficulties encountered and in the present day knowledge clinically fit into this picture

A rough survey of Albany in the last five years shows that not over fifteen cases of this disease has been brought to light by clinicians who handle the bulk of venereal patients in private practice and clinics—and very few chancroids have been seen in the last three years Three years ago there were eight patients under treatment in a short space of time—three had contracted the infection from a colored girl with a circus However I feel that many cases are missed, if we consider that about four per cent according to Clyne of all venereal disease are lymphogranuloma venereum

There are a number of valuable points in this paper from the epidemiological aspect—the possible long incubation period two days to three weeks or even sixty-seven days as

has been reported, the chronic infectious vaginal ulcer, the generalization or systemization of this disease with fever, anemia, leukocytosis, arthralgia, the chronic sinuses simulating late syphilis, tuberculosis and malignancy, the rectal involvement, the involvement of the deeper pelvic glands leading to diagnosis of appendicitis and pelvic disease, the involvement of central nervous system, the edema of lids, episcleritis and conjunctivitis and the cutaneous eruptions are all important subjective and objective symptoms The difficulty in diagnosis, the ruling out of syphilis and chancroid, the positivity of the Frei test over a long period which may lead to an erroneous positive diagnosis of lymphogranuloma venereum just as the positive Wassermann labels all pathology as syphilitic, the lack of superficial adenitis in the female due to deeper lymph drainage in certain parts of the female genitalia which also leads to confusing symptoms, the increased incidence due either to diagnostic alertness or perhaps increased prevalence of the disease, the endemic character of the disease and becoming epidemic even from a single source of infection and its frequent association with syphilis, gonorrhea, and chancroidal infection—are facts which merit our particular attention

Considering all these points it would not be amiss to suggest that the disease be made reportable, and to carry out Dr Bloom's suggestion that the Frei antigen be made available for diagnostic purposes and perhaps a leaflet prepared by the State Medical Society in conjunction with State Department of Health setting forth the clinical aspects and symptomatology, diagnosis, and treatment of this entity for distribution to the medical profession

DR HARRY SAUNDERS, *New York City*—As dermatologists we owe a great deal to Dr Bloom for his work on lymphogranuloma venereum This disease has become a great problem in public health circles and stands second only to syphilis With the adoption of fever therapy and the use of sulfanilamide, gonorrhea has assumed a comparatively minor role Lymphogranuloma venereum has assumed this importance because of the difficulty of diagnosis and because of the poor response to treatment. The temperature curve following an intravenous injection of Frei antigen is also a good indicator of whether we are dealing with this disease

THE JELLIFFE CELEBRATION

The thirty-fifth anniversary of Doctor Smith Ely Jelliffe's editorship of the *Journal of Nervous and Mental Diseases* will be celebrated at The New York Academy of Medicine on April 22 The celebration will consist of a Neuro-Psychiatric Symposium in the afternoon at two o'clock, followed in the evening by a dinner The afternoon session will be opened by Adolph Meyer, and Dr Jelliffe will preside. The afternoon speakers

1 Earl D Bond, "Balance in Psychiatric Research" 2 George Draper, "The Man Factor in Disease." 3 Frederick Tilney, "New Interpretation of the Hippocampus" 4 Oskar Diethelm, "Psychiatry and Neurology in the Last Fifty Years" 5 Karl Menninger, "Somatic Correlations with the Unconscious Repudiation of Femininity in Women"

At the evening session Foster Kennedy will be toastmaster The tribute speakers will be 1 A A Brill, "Jelliffe, the Psychiatrist and Psychoanalyst." 2 Louis Casamajor, "Jelliffe, the Man" 3 Henry Alsop Riley, "Jelliffe, the Neurologist." 4 Richard H Hutchings, "Jelliffe, the Bibliomaniac"

CHIROPRACTIC DOCTORS' HAVE THE DOCTOR" DOCKED

In a forceful opinion filed January 11, Chief Justice M B Rosenberry of the Wisconsin Supreme Court held, in *State of Wisconsin v Henry J Michaels*, that chiropractors were not entitled to the use of the title "Doctor" in Wisconsin, regardless of how their diplomas might read

"The title does not aid him (the chiropractor) in the treatment," pointedly declared the Chief Justice, "it merely aids him in securing the confidence of prospective patients and in inducing people to apply for treatment. The repeated attempts of the practitioners of chiropractic to have the *section in question amended (Sec 147 14(3), c 147, Wis Stats)* seem to be quite conclusive evidence that its meaning is well understood"

IRRADIATION FOR STIMULATING OR SUPPRESSING MENSTRUAL FUNCTION

IRA I KAPLAN, B S M D, *New York City*
Director, Division of Cancer, Department of Hospitals, Director Radiation Therapy Department, Bellevue Hospital

Ever since the discovery of irradiation as a form of therapy, the female reproductive system has afforded the most stimulating and informative field for experimentation and study of the effects of this new therapeutic agent

From the time that Halberstaedter[1] (1905) anounced the specific sensitivity of x-ray on the ovaries, even though the exact action of the x-rays is still unanswered, irradiation has been increasingly employed in the treatment of female functional disturbances In no other branch of gynecology is irradiation more helpful and promising than in the treatment of amenorrhea and sterility Our experience has demonstrated that for these conditions irradiation has appreciable therapeutic effect when administered to the pelvic and pituitary areas, and when properly applied such irradiation is harmful neither to the mother nor to the offspring born following such therapy

The suppression of menstruation or the sterilization of the female in order to treat either directly or indirectly many conditions and lesions associated with ovarian or uterine physiology is one of the most important functions of irradiation

In the United States, Morton[2] (1903) was among the first to report on the sterilization effect of x-rays employed in the treatment of a uterine fibroid In 1920 Seitz and Wintz[3] established the so-called ovarian sterilization dose, i e, that dose of x-ray given through the pelvis which would suppress menstrual function, which dose until recently was used as a basis for the irradiation of the female pelvis in treating gynecological conditions

Before any form of irradiation is employed the patient must be carefully examined, the indications for treatment established, and the mode and method of therapy definitely determined

In cases of amenorrhea or sterility, the patient is first examined for pathological or congenital abnormalities of the genital organs or the presence of infections, and all such conditions must be corrected or eliminated before irradiation is administered The patentcy of the tubes must be established and the general health of the patient brought to a high level. Furthermore, before subjecting the woman to irradiation for sterility, it is essential that the virility of the male be established Endocrine assays should be made, and, if dysfunction is ascertained hormone therapy should be instituted The period of trial should be limited however, because an extended period of amenorrhea will eventuate in uterine atrophy

Because hormone therapy has proven so futile, high voltage x-ray therapy is used exclusively in our method of treatment of amenorrhea and sterility Investigation has shown the definite association of pituitary and ovary in the mechanism of menstruation Where this cooperation between pituitary and ovary is interrupted, it is believed that x-ray therapy re-establishes the relationship necessary to permit menstruation and subsequent pregnancy

Because persistent corpus lutea or cysts of the ovaries may prevent menstruation and subsequent pregnancy, it is thought that x-ray therapy to the ovaries may, by destroying these cysts or corpus lutea, permit normal menstrual function to be resumed and consequently relieve sterility

Treatment by irradiation for amenorrhea and sterility is a very delicate form of therapy and one that calls for fine judgment, based on training and experience In carrying out this type of x-ray therapy, it is absolutely imperative that the therapist know the exact output produced under varying condi-

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

tions and the depth dose must be definitely and accurately determined for if too great a dose is administered, sterilization and not stimulation, may result The size of the pelvis must be determined in order to gauge the distance to be employed

Stimulation x-ray therapy is given with high-voltage x-rays, the factors being 200 kv, four-five ma, with 0 5 mm Cu plus one mm Al filter, at thirty-forty or fifty cm distance, and through fields of 8x10—9x12—10x15 cm The rays are directed through the right and left anterior and posterior pelvic areas over the ovaries, 75-100 r per area per treatment being given to each area once a week, alternately anterior and posterior areas being treated at weekly intervals for three treatments The first treatment is given through the anterior right and left area, one week later through the posterior right and left area, and then after another week, treatment is again administered to the anterior right and left pelvic area The dose given each area is so regulated that the total dose reaching the ovaries is ten to twelve per cent of a full skin erythema In most instances, the first treatment dose is seventy-five r per area, the second one hundred-fifty r and the third seventy-five r—all doses measured in air

In addition, one or two treatments, one week apart, of 75-100 r, are given to the forehead over the pituitary area to stimulate pituitary action This is administered simultaneously with a pelvic treatment

Whenever evidences of hypothyroidism are present, additional treatment to the thyroid area may be given along with x-ray therapy to the ovaries, 75-100 r being given to the thyroid for one or two doses

Menstruation should follow three to four weeks after treatment In cases where it does not occur following the first series, an additional dose of seventy-five r may be given to each anterior pelvic area together with a further treatment of 75-150 r to the anterior pituitary area Treatment beyond this is not advised

In our series of 131 private cases of married women treated over a period of eleven years, only fourteen could not be traced, hence, our results were obtained among the remaining 117 cases

The youngest was nineteen and the oldest forty-five years of age. Only four cases had previously borne children, three had previously aborted or miscarried Amenorrhea existed from one month to fourteen years In seventy-nine cases or sixty-seven percent the menstruation was restored, in fifty-two there was no improvement Of the seventy-nine successful cases forty-four women conceived—seventeen more than once, five conceived but aborted, and of these, two aborted twice. Thirty-eight went to term and gave birth to fifty living children, one still-birth, and one abnormal fetus Nine have had more than one child, one had twin girls, both physically and mentally normal Reports from the parents have in no instance disclosed any abnormality or physical deformity There are twenty-seven boys and twenty three girls in the group, the oldest under study being now over eleven years of age. Table I shows the details regarding these cases

Sterilization

When suppression of menstruation is considered necessary, irradiation, in our opinion, is the method of choice

For sterilization we employ either x-rays or radium High-voltage x-ray is used through the anterior and posterior pelvis through multiple ports and directed to the ovaries and the uterus, administered in divided doses over a period of several weeks

Radium therapy sterilization is carried out by inserting in the uterus a rubber sound containing several tubes of radium in small amounts, and leaving it in place for several days to give the prescribed dose, and by placing in the vagina when necessary a radium applicator (the colpostat) containing a small quantity of radium, which is left in place for several days to give additional irradiation through the vagina to the adnexa.

When properly employed, irradiation for sterilization is of equal worth and effectiveness with surgery and without the latter's associated mortality and morbidity

Conditions in the female for which sterilization may be indicated can be classified for convenience in four large groups—medical surgical, gynecological, and social

Sterilization follows as a necessity when treating malignancy of the gynecological tract

Advantages of Irradiation

Irradiation, either by x-rays or radium, is a direct readily administered, harmless

IRRADIATION FOR STIMULATING OR SUPPRESSING MENSTRUAL FUNCTION

IRA I KAPLAN, B S M D, *New York City*
Director, Division of Cancer, Department of Hospitals, Director Radiation Therapy Department, Bellevue Hospital

Ever since the discovery of irradiation as a form of therapy, the female reproductive system has afforded the most stimulating and informative field for experimentation and study of the effects of this new therapeutic agent

From the time that Halberstaedter[1] (1905) anounced the specific sensitivity of x-ray on the ovaries, even though the exact action of the x-rays is still unanswered, irradiation has been increasingly employed in the treatment of female functional disturbances In no other branch of gynecology is irradiation more helpful and promising than in the treatment of amenorrhea and sterility Our experience has demonstrated that for these conditions irradiation has appreciable therapeutic effect when administered to the pelvic and pituitary areas, and when properly applied such irradiation is harmful neither to the mother nor to the offspring born following such therapy

procedure for sterilizing the female It is the method of choice because, when properly administered, there is no mortality and no morbidity This form of therapy does not necessitate hospitalization, such as required for surgical procedures and which often present innumerable difficult conditions for the surgeon, but it is usually a simple procedure, presenting but few difficulties and rarely any adverse sequelae

Surgical procedures have occasionally proven ineffective while adequately delivered irradiation will definitely insure the patient's sterility

When to Choose Irradiation

Assuming that the internist has decided that sterilization is essential for the patient's welfare in a case with cardiorenal disease or diabetes, irradiation is a therapeutic method of value because one is not called upon to contend with operative shock, infection, bed confinement, and other operative exigencies

Particular attention is called to pulmonary tuberculosis in females where pregnancy may severely delay recovery or even cause death Sterilization in such cases is most effective in providing the patient an opportunity to recover Rather than risk a serious operative procedure when active advanced tuberculosis is present, irradiation is unquestionably the method of choice for sterilization In young women with active tuberculosis where sterilization is decided

upon irradiation may cause cessation of menstruation for only a year or two, with great likelihood for its resumption when the diseased lung condition has been sufficiently arrested. While manifestly this would be an ideal situation, it cannot unfortunately, be assured in every instance, but it does occur in a sufficient number of cases to warrant the use of irradiation as a valuable therapeutic measure.

Although the hormonal relationship is not yet definitely and completely established, we advise total sterilization for women of the menstruating age who have carcinoma of the breast, especially when associated with bone metastases. Clinical observation over a period of many years has shown that patients with breast malignancy, who were unfortunately permitted to go through a pregnancy, suffered a definite aggravation of the cancer. Recently, the influence of estrogenic and lactogenic hormones of the ovary and pituitary upon breast tissue has been demonstrated experimentally and clinically. Accordingly, when it has been decided to sterilize such a patient, it is advisable, rather than submit her to another operative procedure, to effect sterilization by means of irradiation.

Quite often we are confronted with the problem of a woman above forty-five presenting symptoms suggestive of the climacteric, and serious enough to require operative intervention when hormone therapy proves valueless. In such conditions irradiation is effective and harmless in relieving these symptoms, especially the profuse metrorrhagia which frequently characterizes such changes.

When in occasional instances an endometriosis is encountered (as in one such case on our service where the anterior abdominal wall was involved) irradiation can be administered to the ovaries and thus inhibit endometrial activity at the site of the uterine implants. This method is superior to operative removal of the tumor mass along with ovariectomy. With this procedure there is no associated operative risk nor mortality.

Method and Technic

1. X-ray therapy is the most practical method to employ for sterilization. Patients can be treated ambulatory with but little distress and minimum amount of disturbance.

2. Radium therapy may be utilized but requires hospitalization in most instances. X-ray is used in those conditions where any type of surgical procedure is contraindicated and therefore radium may not be employed.

3. In such conditions where patients are close to the menopause, thin patients, and where for economic reasons patients cannot afford necessary hospitalization it is advisable to employ x-ray therapy.

4. X-ray therapy is used for temporary sterilization in young women or women for whom temporary amenorrhea is required for relief of local or general conditions because of the greater ease of control of the administered dosage. At present we have definite physical means of measuring x-ray dosage under standard conditions in a specific unit.

The use of radium is advised where bleeding is profuse and there is immediate, urgent need to arrest hemorrhage. In young women, radium will more permanently destroy the endometrium than will x-ray. In very obese women, where x-ray is ineffective because an insufficient depth dose reaches the pelvic organs direct radium application in the uterus is required. In cases where inadequate x-ray therapy has failed to achieve the desired results radium therapy is indicated.

Formerly radium therapy was deemed preferable for young women, since small doses destroyed the endometrium but spared to a great extent the ovary due to the protection afforded by the distance of the uterine canal from the ovary. In our experience, reported in 1936 we determined[4] that only about twenty-four per cent of the radium dose given in the uterus reaches the ovaries.

However whereas resumption of menstrual function after x-ray therapy has occurred quite often, it is apt to be perma-

TABLE II—100 METRORRHAGIA CASES

Married	77	White	104
Single	29	Colored	2

Age group:
10-19 years: 9
20-29 years: 20
30-39 years: 25
40-49 years: 47

Menstrual onset:
Youngest at 11 Oldest at 30.
Average 12-15
Symptoms Excessive bleeding from 1-6 mos

Married group:
13 had one previous child
43 had two or more children
One single woman had 1 child

Treatment:
X-ray therapy alone 89
Radium therapy alone 8
X-ray and radium combined 6
No irradiation was given in 3. Rest and hygiene was the therapy employed.
In 12 additional irradiation was administered to the spleen.

Results:

procedure for sterilizing the female. It is the method of choice because, when properly administered, there is no mortality and no morbidity. This form of therapy does not necessitate hospitalization, such as required for surgical procedures and which often present innumerable difficult conditions for the surgeon, but it is usually a simple procedure, presenting but few difficulties and rarely any adverse sequelae.

Surgical procedures have occasionally proven ineffective while adequately delivered irradiation will definitely insure the patient's sterility.

When to Choose Irradiation

Assuming that the internist has decided that sterilization is essential for the patient's welfare in a case with cardiorenal disease or diabetes, irradiation is a therapeutic method of value because one is not called upon to contend with operative shock, infection, bed confinement, and other operative exigencies.

Particular attention is called to pulmonary tuberculosis in females where pregnancy may severely delay recovery or even cause death. Sterilization in such cases is most effective in providing the patient an opportunity to recover. Rather than risk a serious operative procedure when active advanced tuberculosis is present, irradiation is unquestionably the method of choice for sterilization. In young women with active tuberculosis where sterilization is decided

UROGENITAL TUBERCULOSIS IN INFANTS AND CHILDREN

MEREDITH F CAMPBELL, M D, *New York City*

From the Department of Urology New York University College of Medicine and the Departments of Children's Medicine, Surgery and Urology, Bellevue Hospital

Most tuberculosis specialists feel that surgical urogenital tuberculosis in the young is one of the rarest diseases, and medical practitioners in general seem utterly unaware of the existence of these lesions in children Yet my own experience, as well as that of many other urologists, has shown that in the differential diagnosis of urologic conditions in children the possibility of a tuberculous infection must ever be kept in mind For example, rather extensive personal studies have shown that one in approximately every fifty to sixty cases of so-called chronic pyelitis in children is surgical renal tuberculosis [1] Tuberculosis of the epididymis is commonly misdiagnosed tumor of the testicle In four cases of so-called enuresis in children a secondary tuberculous infection of the bladder caused the clinical picture [2 3]

Acute miliary renal tuberculosis is not considered in the present discussion The fact that the child develops chronic caseous tuberculosis points to an exceptional resistance on his part

Chronic Renal Tuberculosis

Surgical renal tuberculosis is rare in infancy, its incidence rapidly increases with the succeeding years By more frequent complete urologic examination in young patients with so-called chronic pyelitis the true incidence of surgical tuberculous renal infection will be found much higher than the present collected data indicate I have excised tuberculous kidneys from eight children under the age of fifteen years the youngest was twenty-five months old In two other children I have observed hopeless bilateral renal tuberculosis

Etiology and pathogenesis Chronic renal tuberculosis occurs more often in males in the ratio of three to two and on the right side in the ratio of five to four Exposure to active pulmonary tuberculosis is probably a more important etiologic factor than milk infection The same anatomic factors—renal mobility, obstructive malformation etc—which predispose to nontuberculous infections of the kidney may likewise predispose to the tuberculous variety

The renal infection is always secondary to a tuberculous focus elsewhere When urogenital and skeletal tuberculosis coexist, they may be assumed to be secondary to a common primary focus It is probable that the hematogenous route is the usual pathway of renal infection although recent experimental work suggests that lymphatic transmission operates in a fair number of cases Moreover, it is believed by most urologists that the initial hematogenous invasion is bilateral, but because the resistance of one kidney is greatly diminished the disease becomes clinically evident only on this side The miliary lesions in the other kidney heal spontaneously Medlar [4] has shown that minute renal tuberculous lesions may produce no symptoms and may heal spontaneously On the other hand, it is accepted that spontaneous healing of surgical renal tuberculosis does not occur Those who believe the initial renal process is unilateral hypothecate a massive tuberculous embolism to this kidney At any rate the organ is invaded, the tuberculous process develops and, untreated will destroy the kidney (Fig 1) During this destructive activity, the other kidney frequently becomes infected Bilateral caseous renal tuberculosis is the terminal picture (Fig 2)

With the development of unilateral caseous renal tuberculosis the uninfected renal mate almost always develops a toxic nephritis caused by tuberculotoxin originating in the diseased organ or in extraurinary foci Casts frequently appear in great showers from the uninfected

nently suppressed following radium therapy

Effectiveness of Irradiation

1 The older the patient and the nearer the menopause the more rapid and more permanent is the sterilization Rubenfeld and Maggio,[5] based on the study of a large number of cases treated at Bellevue Hospital determined the chances of resuming menstruation after irradiation to be, in the age group of twelve-eighteen years, one hundred per cent, between the ages of thirty-three-thirty-nine, only fifty-three per cent, and in patients over fifty-three years of age zero per cent. The age group between nineteen and thirty-two usually resume menstrual function in about seventy-five-eighty per cent of the cases treated. In our present series of 106 patients, the results previously noted by Rubenfeld and Maggio were confirmed (Table II)

2. The more intense the x-ray therapy administered directly to the ovaries and uterus, the more permanent the results In radium therapy, the total dose, the thickness of the filter, the length of time employed for the application are factors which control the effect of the irradiation In our opinion radium therapy when properly used will more positively sterilize the female than x-ray and the more intense the dose, the more positive the results

3 The stouter the patient, the lower the intensity of the radiation reaching the ovaries or uterus Therefore a greater surface dose is required for a stout person in order to increase the percentage of depth dose reaching the uterus and ovaries

Conclusion

Irradiation is a valuable therapeutic means for stimulating or suppressing menstrual function When properly employed by those qualified by training and experience it is effective in a large percentage of cases so treated When so administered is neither harmful to the mother nor infant born following stimulation x-ray therapy When used for sterilization irradiation is as effective as surgery without any associated mortality or morbidity

CARDIAC CLINIC CONFERENCE COMING

A Scientific Session of the New York Heart Association and the Committee on Cardiac Clinics, for the presentation of papers on the original investigations carried on in the affiliated cardiac clinics will be held on April 26 at 8 30 P M, in the New York Academy of Medicine, Room 20, New York City Dr Edwin P Maynard, Jr, Chairman of the Committee on Cardiac Clinics, will preside The program is as follows

1 "Bundle Branch Block" by Meyer Sclar, M D of the Department of Cardiology of Kings County Hospital

2. "The Effect of Digitalis on the Abnormal Electrocardiogram" by Milton Kissin, M.D and Marcus Feinstein, M.D, Beth Israel Hospital.

3 "Pressor Substances in the Kidney in Experimental and Clinical Hypertension" by Ben Friedman, M D, Myron Prinzmetal, M.D., George W Pickering, M.D., and David I Abramson, M D—Sutro Fellows in Cardiovascular Research at Mount Sinai Hospital

4 "Anti-Streptolysin Titer in Adult Rheumatic Fever Patients" by Joseph J Bunim, M.D, Currier McEwen, M D, and Rose C. Alexander, M A. of the Department of Medicine of New York University College of Medicine, and Third Medical Division and the Laboratories of Pathology of Bellevue Hospital

5 "Heart Sounds in Normal Children" by Margaret H McKee, M D of Irvington House for Cardiac Children

6 "Observations on Ventricular Fibrillation" by Louis H. Sigler, M D., Attending Cardiologist, Coney Island and Harbor Hospitals

---

Caller So the doctor brought you a little sister the other night, eh?

Tommy Yeh, I guess it was the doctor done it. Anyway, I heard him tellin' pa some time ago that if he didn't pay his bill he'd make trouble for him—*Nebr State Med Jour*

Robert, six, had prayed long and ardently for a baby sister and without results Then one night he added this

"And please, if you have a baby almost finished, don't put in any tonsils or adenoids, 'cause they'll cut 'em out anyway"—*Canadian Doctor*

UROGENITAL TUBERCULOSIS IN INFANTS AND CHILDREN

MEREDITH F CAMPBELL, M D, *New York City*

From the Department of Urology, New York University College of Medicine and the Departments of Children's Medicine, Surgery and Urology, Bellevue Hospital

Most tuberculosis specialists feel that surgical urogenital tuberculosis in the young is one of the rarest diseases, and medical practitioners in general seem utterly unaware of the existence of these lesions in children Yet my own experience, as well as that of many other urologists, has shown that in the differential diagnosis of urologic conditions in children the possibility of a tuberculous infection must ever be kept in mind For example, rather extensive personal studies have shown that one in approximately every fifty to sixty cases of so-called chronic pyelitis in children is surgical renal tuberculosis [1] Tuberculosis of the epididymis is commonly misdiagnosed tumor of the testicle In four cases of so-called enuresis in children a secondary tuberculous infection of the bladder caused the clinical picture [2 3]

Acute miliary renal tuberculosis is not considered in the present discussion The fact that the child develops chronic caseous tuberculosis points to an exceptional resistance on his part

Chronic Renal Tuberculosis

Surgical renal tuberculosis is rare in infancy, its incidence rapidly increases with the succeeding years By more frequent complete urologic examination in young patients with so-called chronic pyelitis the true incidence of surgical tuberculous renal infection will be found much higher than the present collected data indicate. I have excised tuberculous kidneys from eight children under the age of fifteen years the youngest was twenty-five months old In two other children I have observed hopeless bilateral renal tuberculosis

Etiology and pathogenesis Chronic renal tuberculosis occurs more often in males in the ratio of three to two and on the right side in the ratio of five to four Exposure to active pulmonary tuberculosis is probably a more important etiologic factor than milk infection The same anatomic factors—renal mobility, obstructive malformation, etc—which predispose to nontuberculous infections of the kidney may likewise predispose to the tuberculous variety

The renal infection is always secondary to a tuberculous focus elsewhere When urogenital and skeletal tuberculosis coexist, they may be assumed to be secondary to a common primary focus It is probable that the hematogenous route is the usual pathway of renal infection although recent experimental work suggests that lymphatic transmission operates in a fair number of cases Moreover it is believed by most urologists that the initial hematogenous invasion is bilateral, but because the resistance of one kidney is greatly diminished the disease becomes clinically evident only on this side The miliary lesions in the other kidney heal spontaneously Medlar [4] has shown that minute renal tuberculous lesions may produce no symptoms and may heal spontaneously On the other hand, it is accepted that spontaneous healing of surgical renal tuberculosis does not occur Those who believe the initial renal process is unilateral hypothecate a massive tuberculous embolism to this kidney At any rate the organ is invaded, the tuberculous process develops and untreated, will destroy the kidney (Fig 1) During this destructive activity, the other kidney frequently becomes infected Bilateral caseous renal tuberculosis is the terminal picture (Fig 2)

With the development of unilateral caseous renal tuberculosis the uninfected renal mate almost always develops a toxic nephritis caused by tuberculotoxin originating in the diseased organ or in extraurinary foci Casts frequently appear in great showers from the uninfected

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

Fig 1 Advanced caseous renal tuberculosis in eleven-year-old boy examined because of "chronic pyelitis" and hematuria with low-grade fever Large solitary sealed off abscess was teeming with tubercle bacilli, yet these organisms could be identified in urine only by guinea pig inoculation.

organ and the function of this organ is variably depressed Following removal of the diseased kidney, however, the remaining nontuberculous kidney is usually restored to normal and adequately fulfills its function

Symptoms The usual urinary symptoms of renal tuberculosis in children commonly lead to the diagnosis of chronic pyelitis and because symptoms referable to the bladder are the chief complaint in over three-fourths of the cases, cystitis is usually incorporated in the diagnosis The earliest vesical symptoms result from irritation of the tuberculous urine which is characteristically highly acid but later, pronounced urinary frequency, dysuria, and hematuria are directly due to acute tuberculous infection, sometimes with secondary ulcerative vesical changes Occasionally the urinary frequency amounts to incontinence and even may cause the diagnosis of enuresis erroneously to be made At times a painless initial hematuria directs attention to the urinary tract Pain referable to the upper urinary tract occurs in a third of the cases Chronic pyuria almost always exists A sterile pyuria should be considered tuberculous until proved otherwise Repeated gastrointestinal upsets occur in fully fifty per cent of all cases of urinary tuberculosis and are most striking in the young Fever is observed in a third of children with renal tuberculosis and in the terminal stage of the disease uremic manifestations frequently appear As a rule, however, the dominant symptoms are persistent pyuria and an increasingly severe cystitis

Diagnosis The initial diagnostic investigation is a complete physical examination which may reveal clues suggestive of tuberculous infection—cervical adenitis, persistent fistulae, pulmonary findings, etc Careful examination of the catheterized urine specimens will disclose tubercle bacilli in eighty to ninety per cent of the cases A catheterized specimen should always be insisted upon in

Fig 2 Bilateral renal tuberculosis in six-year-old boy Excretory urogram indicates inflammatory dilation and irregularity of renal pelves and ureters. Bladder likewise shows deformity secondary to tuberculous changes, there is slight suggestion of hour-glass effect. Inoperable condition Sanitorium treatment Uremic death one year later

the female This is unnecessary in the male except when a specimen cannot be obtained by voiding after a careful washing of the glans penis and urethral meatus with an antiseptic solution and the passage of a few c.c of urine. The urine specimen is centrifuged for fifteen minutes at 2500 revolutions per minute The sediment is transferred by a pipette to the glass slide and stained by the usual acid-fast method Repeated daily examinations are preferable to a prolonged single search As a rule, the guinea pig test will identify the organism when microscopic examination has failed

The child is next subjected to a complete urologic examination at which time the ureters are catheterized, a divided renal function test is performed and, usually, pyelography is performed (Fig 3) Not only will the diseased kidney be identified but, even more important, the presence or absence of tuberculosis in the other kidney will be determined. This last observation is of crucial therapeutic concern for bilateral renal tuberculosis is not amenable to surgical treatment and offers a hopeless prognosis

Fig 3 Renal tuberculosis in ten-year-old girl examined because of "chronic pyelitis" In this postoperative pyelogram of removed kidney extent of tuberculous ulcero-cavernous excavation is indicated. Kidney is half again normal size and contour is irregular Apparently cured one year postoperative.

Fig 4 Vesical tuberculosis in nine-year-old boy with tuberculosis of left kidney, prostate and left seminal vesicle, vas deferens, and epididymis Symmetrically contracted, slightly hour-glass bladder is cystographically demonstrated

Treatment In the treatment of renal tuberculosis it must be recognized that the surgical variety is never a self-limited disease but regularly follows a progressively destructive course In autonephrectomy, in which the diseased organ becomes spontaneously sealed off, the tragedy is postponed, not averted (Fig 4) In unilateral renal tuberculosis, nephrectomy should be performed when the diagnosis is established and the condition of the child permits The latter implies absence of acute tuberculous infection elsewhere, the urinary lesion is but one phase of a systemic tuberculosis

The chief contraindications to nephrectomy are bilateral renal tuberculosis, advanced interstitial nephritis, aplasia or absence of the opposite kidney, or active tuberculosis elsewhere Bilateral renal tuberculosis is practically always a nonsurgical condition Partial resection of a tuberculous kidney is valueless Tuberculin and heliotherapy play a limited role in the treatment of urological tuberculosis Surgical therapy is most successful when preceded and followed by sanitorium care

Prognosis The operative mortality in children should not be over five per cent, but approximately twenty per cent will die of urogenital tuberculosis during the first two postoperative years In the

Fig 1 Advanced caseous renal tuberculosis in eleven-year-old boy examined because of "chronic pyelitis" and hematuria with low-grade fever Large solitary sealed off abscess was teeming with tubercle bacilli, yet these organisms could be identified in urine only by guinea pig inoculation

organ and the function of this organ is variably depressed Following removal of the diseased kidney, however, the remaining nontuberculous kidney is usually restored to normal and adequately fulfills its function

Symptoms The usual urinary symptoms of renal tuberculosis in children commonly lead to the diagnosis of chronic pyelitis and because symptoms referable to the bladder are the chief complaint in over three-fourths of the cases, cystitis is usually incorporated in the diagnosis The earliest vesical symptoms result from irritation of the tuberculous urine which is characteristically highly acid but later, pronounced urinary frequency, dysuria, and hematuria are directly due to acute tuberculous infection, sometimes with secondary ulcerative vesical changes Occasionally the urinary frequency amounts to incontinence and even may cause the diagnosis of enuresis erroneously to be made At times a painless initial hematuria directs attention to the urinary tract Pain referable to the upper urinary tract occurs in a third of the cases Chronic pyuria almost always exists A sterile pyuria should be considered tuberculous until proved otherwise Repeated gastrointestinal upsets occur in fully fifty per cent of all cases of urinary tuberculosis and are most striking in the young Fever is observed in a third of children with renal tuberculosis and in the terminal stage of the disease uremic manifestations frequently appear As a rule, however, the dominant symptoms are persistent pyuria and an increasingly severe cystitis

Diagnosis The initial diagnostic investigation is a complete physical examination which may reveal clues suggestive of tuberculous infection—cervical adenitis, persistent fistulae, pulmonary findings, etc Careful examination of the catheterized urine specimens will disclose tubercle bacilli in eighty to ninety per cent of the cases A catheterized specimen should always be insisted upon in

Fig 2 Bilateral renal tuberculosis in six-year-old boy Excretory urogram indicates inflammatory dilation and irregularity of renal pelves and ureters Bladder likewise shows deformity secondary to tuberculous changes, there is slight suggestion of hour-glass effect. Inoperable condition. Sanitorium treatment. Uremic death one year later

Treatment Inasmuch as prostatic and vesicular tuberculosis are associated with or are secondary to renal invasion above or epididymal invasion below, amputation of the involved kidney or epididymis or of both is the initial surgical procedure Following this most prostatic lesions will heal spontaneously In cases of advanced genital tuberculosis the prostate, seminal vesicles, and both the casa deferens and epididymes have been resected When these surgical procedures are contraindicated by far-advanced urologic disease, active pulmonary tuberculosis, etc, only sanatorium treatment should be employed

Summary

The tuberculous lesions of the urogenital apparatus in children have been briefly considered with the hope that in the clinical study of urogenital diseases of all types in the young, tuberculosis will more often be borne in mind in the differential diagnosis

A CASE OF HEMIBALLISMUS

Motion Picture Presentation and Necropsy Findings

Hugh S Gregory, M.D, *Binghamton*
Pathologist, Binghamton State Hospital

The patient, about to be described, presented very violent unilateral movements of the left arm, which resembled hammering motions, as well as kicking movements of the left leg The descriptive term, hemiballismus, is suggested as a diagnosis

The case is that of a white woman, sixty-eight years of age, with a family history of father dying of a paralytic stroke at the age of seventy-six Her more recent personal history revealed that in 1927 she had some sort of a paralytic stroke causing her to fall to the floor in her home following which she complained of numbness through the left side of her body

This gradually cleared and she showed no further symptoms of cerebral arteriosclerosis for about four years However, for the past four years she has complained of headaches, dizziness, and ringing in the ears

The last illness developed February 10, 1936 when she again fell to the floor while working in her home Following this she began to show choreiform movements of the left arm and leg which progressed in severity to a point where she shook the bed violently These movements were practically continuous except during sleep when they ceased She would attempt to control their violence by crossing her legs and by grasping her left arm with the right hand Mentally she seemed cheerful though there was some emotional instability Tests for memory showed slight defects Neurological examination failed to reveal anything of additional note

She was given stramonium in small doses and this drug seemed to definitely modify the intensity of her movements as well as their character The motion pictures,* unfortunately, were not taken till after this very definite improvement had taken place so they fail to show the characteristic motions seen originally Occasionally there is seen a movement

The writer wishes to express his appreciation to Dr George S Lape for permission to examine this patient and make the photographic and autopsy studies

*The author showed 100 ft of motion picture film to illustrate the movements shown by this patient

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

evaluation of surgical and nonsurgical treatment, in a series of 316 cases not operated upon only six per cent lived more than ten years (Schlesinger and Heidrick) Yet in 270 cases operated upon by Wildbolz, fifty-eight per cent were fully recovered ten years postoperative

Tuberculosis of the bladder is always a secondary lesion and will usually disappear spontaneously following the removal of the tuberculous kidney However, advanced sclerotic changes coincident to the healing of large tuberculous vesical ulcers may cause pronounced bladder deformities

Genital Tuberculosis

Tuberculosis of the epididymis is practically always secondary to renal tuberculosis Although genital tuberculosis is uncommon in the young, it must be considered in the differential diagnosis of scrotal swellings A boy of twenty-five months was admitted to the hospital with a diagnosis of tumor of the testicle The testicle felt normal, but along the side of it I could palpate a considerably enlarged nodular epididymis which caused the diagnosis of tuberculous epididymitis to be made Epididymectomy was performed Urinalysis was negative except for the presence of tubercle bacilli, there were no urinary symptoms Urologic examination including pyelography revealed an early caseous lesion of the right upper calyx Nephrectomy was performed This observation is not an uncommon one in adults and I have observed its counterpart in nine other children, aged one and a half, three, five, seven, eight, ten, eleven, and thirteen years

It is unimportant whether the epididymal infection is primarily hematogenous or results from secondary extension from a tuberculous prostate or seminal vesicle, in turn secondarily infected by urine from renal tuberculosis These are the two theories of the mode of infection It is important, however, to recognize that the disease involves the epididymis primarily, true tuberculous orchitis is almost always a secondary invasion from a caseous epididymis Unless beclouded by overlying hydrocele the enlarged nodular epididymis can be sharply distinguished from the adjacent normal feeling testicle As a rule, the epididymal enlargement is first noted at the lower pole The vas deferens may or may not be thickened Yet the former is the rule and is first noticed in the region of the epididymis

Epididymectomy is the treatment, yet orchidectomy must be performed when the testicle is secondarily involved Tuberculous scrotal fistulae must also be excised with the epididymis Heliotherapy and tuberculin therapy may be of supportive value but *per se* should not be relied upon to cure the epididymitis If the prostate is also tuberculous, the vas deferens on the opposite side should be divided between ligatures to prevent tuberculous extension to that epididymis Although this sterilizes the patient it must be recognized that his life is at stake Because of his genital tuberculosis he must always be rated a far-advanced case

Tuberculosis of the prostate and seminal vesicles is probably never primary but follows renal or epididymal infection The process in the prostate causes a nodular induration with more or less sclerotic periprostatitis and as the lesion advances a caseous abscess may sometimes be palpated The seminal vesicle is invaded through its ejaculatory duct and changes corresponding to those in the prostate commonly occur

The symptoms of prostatic and seminal vesicle tuberculosis are predominantly those of acute or hyperacute cystitis and result from intense inflammation of the overlying mucosa of the vesical trigone and outlet and of the posterior urethra In advanced disease the patient may urinate every fifteen to twenty minutes day and night and suffer tenesmus, hematuria, and pain referred to the perineum, rectum, meatus, or sacroiliac region With rupture of a prostatic or seminal vesicle abscess perineal fistulization may occur The diagnosis is made by rectal examination and the demonstration of urogenital tuberculosis elsewhere The examining finger detects the organs to be enlarged, irregularly indurated, and perhaps even soft caseous foci may be identified Periprostatic and perivesicular thickening is noted

GYNECOMASTIA IN LUNG TUMOR

Associated with Pulmonary Tuberculosis

ALEXANDER ALTSCHUL, M D, *New York City*

The association of lung tumor and active pulmonary tuberculosis has long been considered an uncommon occurrence. The statistical studies of autopsies as given by some authors tend to bear out this contention

Rokitansky, in 1841, noted a definite antagonism between tubercle and malignancy He maintained that organs prone to cancer rarely developed Koch infection As examples he pointed to such organs as the ovary, stomach, salivary glands, esophagus, and rectum On the other hand, the lungs and ileum, which are frequently the seat of tubercular involvement, rarely have neoplasm Of course, since his time, the incidence of lung tumor has increased considerably Yet, the frequency of the association of the two is still sufficiently uncommon as to be noted

Landis, at Phipps Institute,[1] in 633 autopsies on tubercular patients, reported not one case of cancer Williams[2] found tubercular lesions only twice in 136 cancer postmortems Kelynack,[3] in the Manchester Infirmary, found it twice in 145 postmortems Pearl[4] says that there is a definite marked antagonism and incompatability between cancer and tuberculosis Both occur together in florid activity very rarely

However, the combination of the two conditions is seen more frequently than these authors report. At Montefiore Hospital,[5] in ninety-nine cases of primary carcinoma of the lung, twelve had active pulmonary tuberculosis and of 633 postmortems of cancer of any organ, forty-five had tubercular lesions The incidence, at any rate, is smaller than one would expect, with allowance for the fact that tuberculosis occurs more frequently in younger individuals (under thirty-five) and cancer is more common over forty

The occurrence of enlargement of the breasts in the male suffering from carcinoma of the lungs and pulmonary tuberculosis is so unusual as to warrant reporting Chorioepithelioma with metastasis to lung and abdomen and enlargement of the male breasts, has been described Erstwhile and Hepp[5] report such a case with a positive Aschheim-Zondek test

Gynecomastia, or abnormal enlargement of the breasts, unassociated with pulmonary pathology, has been observed to occur in (1) Syringomyelia and medullary disease, (2) Chorion-epithelioma with positive Aschheim-Zondek reaction, (3) Endocrine disorders of the pituitary and gonads (Reclus' disease, which is multiple benign cystic disease), (4) Hepatic disease, i e., cirrhosis of the liver,[6] (5) Dietary deficiency with avitaminosis (Weir[7] reported enlargement of the male breasts in natives of West Africa on a limited dietary), (6) Hermaphrodism, (7) Essential gynecomastia

Case Report

H M, age fifty-three, radio repair man, born in U S.A., married, first consulted me on June 28, 1932, for cough, fatigue, and occasional bloody sputum. He had suffered from cough and frequent hemoptysis for eleven years A diagnosis of bilateral pulmonary tuberculosis was made in 1921, and a positive sputum for B Koch was obtained He had made his home in the mountains ever since. In 1926, he had profuse hemoptysis which left him in a critical condition from loss of blood. He recovered from this, however, and his pulmonary condition was apparently arrested until the onset of his present illness.

Two brothers had died of tuberculosis, one pulmonary and the other intestinal Father had died of pneumonia, mother of cerebral hemorrhage.

Physical examination showed a man of fair nutrition, weighing sixty-five kgm, and 1 65 m in height. Blood pressure was 110/90 Lungs showed deviation of trachea to the right, dullness, anteriorly, apex to the third rib on the right side, and posteriorly to the fifth dorsal spine On the left side,

From the Medical Service of Harlem Hospital, Dr O LaRotunda Director of Medicine and from the Medical Service of Dr H R. Miller, Sydenham Hospital

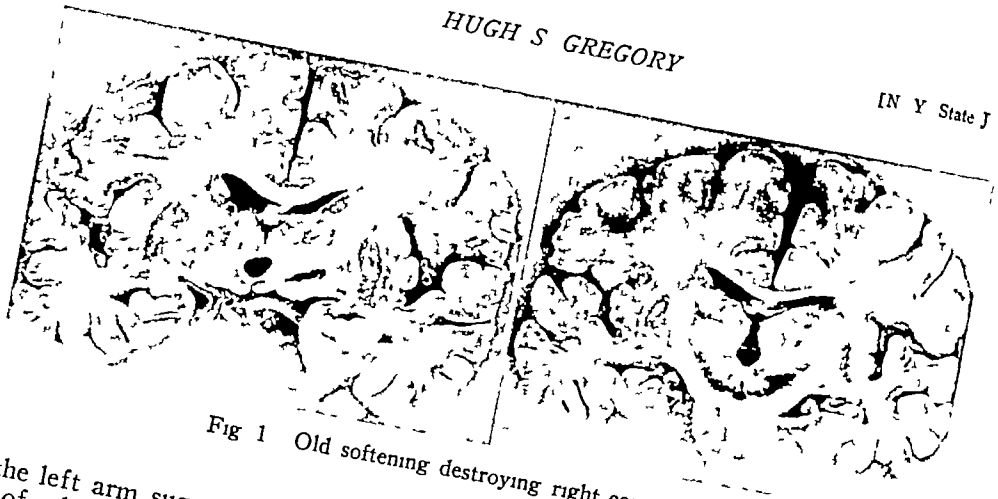

Fig 1 Old softening destroying right corpus Luysi

of the left arm suggestive of the "wind-up" of a baseball pitcher Death occurred about three months after onset of symptoms

Autopsy

Brain weight 1245 Gm Meninges normal The cerebral vessels showed marked atherosclerotic changes The region of the right corpus Luysi (Fig 1) was the site of an old rusty, partially absorbed, softening which extended anteroposteriorly for a distance of about two cm through the diencephalon In cross section it measured about two by five mm There were also scattered lacunar softenings through the basal ganglia region

Other autopsy findings were of an arteriosclerotic nature and confined to the heart and kidneys

STATE HOSPITAL

Discussion

DR LLOYD H ZIEGLER, *Albany*—It was my good fortune to see a patient recently with syndrome in a woman of fifty-seven in whom the movements were at first bilateral but within a day or two became unilateral Because she wept rather easily and had had many troubles rather recently, one of my house officers felt it to be functional Both the athetoid hammering and kicking movements suggested strongly this syndrome and she still survives

I saw a patient with these movements bilateral who was said to be a victim of chronic mercury poisoning He had been working in the felt industry

DR. R W SOUTHERLAND, *Brentwood*—Since I have had only one case of hemiballismus I shall not discuss the case which has been presented further than to agree with the diagnosis offered Dr Gregory has apologized for not having taken motion pictures of the case during the pretreatment period when the rapidity of the movements was more marked before they became slower under stramonium therapy May I suggest that the analysis of such abnormal involuntary movements be best studied under a "slow motion" moving picture reproduction?

The lesion shown on gross section in the case further stresses the point brought out in the preceding paper, namely, the need for close correlation between neuroanatomical and neurophysiological studies in the medical courses of the undergraduate student. Only yesterday, Dr Stookey pointed out that it was necessary to apply four per cent novocain to the dorsal roots during rotation of the cord by traction on the dentate ligament preliminary to the section of the spinothalamic tracts Manipulation of the dorsal roots causes pain, but the cutting of the pain-conducting tracts does not

This has always puzzled me and I feel that my knowledge of the correlation of anatomy and function in this region is inadequate to explain this fact.

At times one encounters difficulty in distinguishing between the psychogenic dyskinesiae and those of organic origin In one of my cases, the patient tried to cover up the early symptoms of a Huntington's chorea by manneristic movements of the arms, hands, and feet. He did not give a true history until confronted directly with the diagnosis with which he was completely familiar

I submit that a "slow motion" picture reproduction of such patients may offer the best opportunity for analysis of abnormal involuntary movements and thereby aid in the distinction between psychodyskinesiae and dyskinesiae of organic origin

He now showed definite clubbing of the fingers

On the next day, patient was admitted to the medical service of Mt Sinai Hospital, The following findings were noted emaciation, dyspnea, cyanosis, clubbing of fingers, dullness and rales of the right upper lobe and the upper part of the right lower lobe, and slight dullness of the left upper lobe posteriorly X-ray showed "old fibrotic tuberculosis right upper lobe with numerous bleb-like cavities and shrinkage of the lobe, and a dense lobular mass arising in the left hilum and in the region of the apex of the left lower lobe. Comparison with x-rays taken two years ago showed that the hilar lesion on the left side had already been present, but was very much smaller"

Bronchoscopy showed stenosis of the left

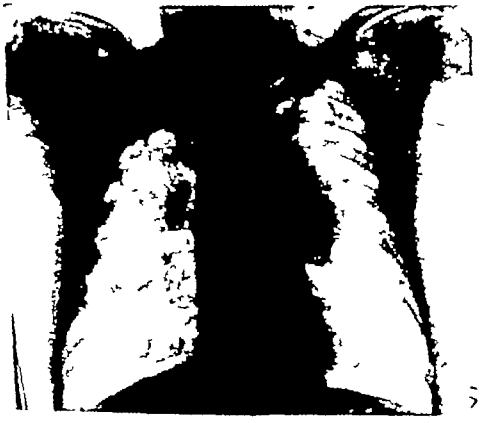

Fig 4 Left hilum shadow still larger (Aug 13, 1934)

upper lobe bronchus by a mass springing from the left posterolateral wall, biopsy of which revealed one small fragment of tissue suggestive of squamous cell carcinoma Sputum was negative for tuberculosis Von Pirquet was positive. On August 16, examination of the larynx showed slight congestion of the vocal cord No recurrent palsy present Patient discharged September 5, with diagnosis of (1) pulmonary tuberculosis right upper lobe, right lower lobe, left upper lobe, bronchiectasis (?), (2) pulmonary neoplasm left lung, (3) Arteriosclerotic heart disease.

On January 31, 1935, patient at home had attacks of dyspnea, wheezing, and obstructive type breathing There are no enlarged cervical or axillary glands noted There is a definite symmetrical enlargement of both breasts (Fig 6) Aschheim-Zondek test was negative.

At the time of death on March 15, 1935, the breasts had grown much larger

Fig 5 Noted marked increase in size of left hilum shadow (October 14, 1934)

This patient, who had pulmonary tuberculosis of long-standing, with a flare-up and hemoptysis on numerous occasions, began showing progressive loss of weight and cough out of proportion to his previous condition As shown in the serial x-rays, the hilum shadow, which undoubtedly was due to malignancy, increased in size, and at the end of one year a definite enlargement of both breasts appeared

Fig 6 Definite enlargement of both breasts despite general emaciation (January 31, 1935)

Fig 1 Dense markings of right upper half of chest with numerous small cavities There are dense markings left side apex to second rib Note several calcified glands in left hilum Ascending aorta is elongated and arch widened. (Oct 8, 1932)

there was dullness from the apex to the second rib and posteriorly from the apex to the third dorsal spine There was suggestive amphoric breathing, right side anteriorly, and a moderate number of medium-sized moist rales, anteriorly and posteriorly, and over the left apex

Fluoroscopy and x-ray of chest (Fig 1) showed tracheal deviation to the right, dense markings of the right upper half of the chest with small cavitation, increase in markings and density of the left upper chest to the second rib Hilum shadows were slightly enlarged but not unduly prominent. Urine was negative *Blood* Hemoglobin eighty-five per cent, RBC 4,850,000, WBC 9200 *Differential* Polynuclear neutrophile seventy per cent, lymphocytes twenty-eight per cent, monocytes two per cent Blood Wassermann was negative Blood Urea N 10 2 mgm /100 c.c Electrocardiograph showed low voltage QRS complexes, slurred and notched, inverted T, leads I and II

From February 12 to October 14, 1933, he was seen at intervals of one to two months Physical examination and x-ray examinations of chest unchanged Complaining of bouts of cough and occasional small hemoptysis

October 14, 1933 Weight sixty-three kgm. complaining of anorexia. Physical examination shows an increase in the number of moist rales in the right upper lobe, with a slight extension of the process

February 19, 1934 Complaining of weakness, weight loss, dyspnea, increased and more productive cough, anorexia Fluoroscopy and x-ray (Fig 2) show a large left hilum Rest of examination unchanged.

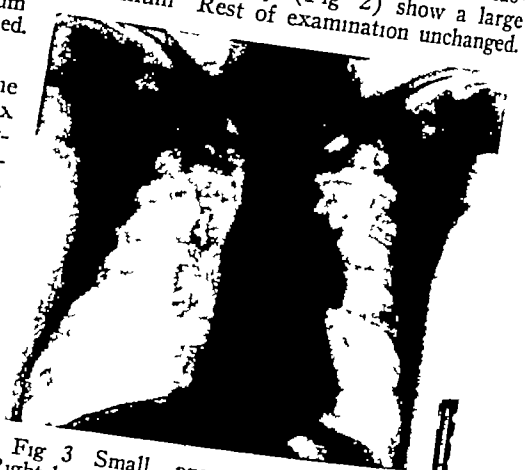

Fig 3 Small pneumothorax right chest. Right lung is not collapsed Left hilum shadow has increased in size. (April 28, 1934)

On the basis of the x-ray findings, a tentative diagnosis of pulmonary neoplasm was made and hospitalization was advised

On April 2, patient was hospitalized and at the insistance of the consultant for a life insurance company, initial therapeutic pneumothorax of the right chest was induced, giving 150 c c of air with the first collapse There was marked spontaneous dyspnea during the night, about ten hours after the collapse which lasted about ten minutes, and which was relieved by morphine and by adrenalin

Several small pneumothorax treatments were repeated without successful collapse of the lung X-ray examination (Fig 3) showed no increase in the pneumothorax, absence of collapse of the cavities, and a definite increase in the size of the left hilum shadow

The patient continued to lose weight and on August 13, x-ray (Fig 4) showed a further increase in the size of the left hilum

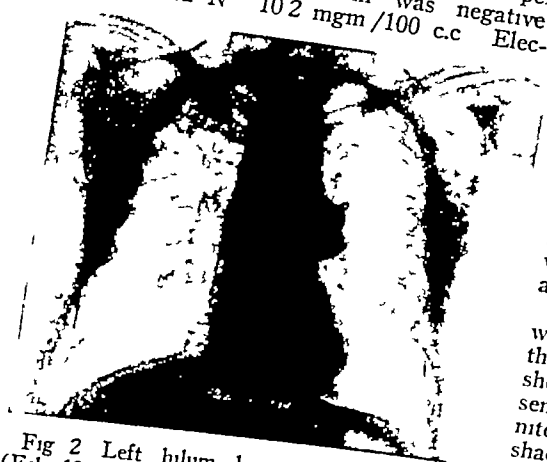

Fig 2 Left hilum has increased in size. (Feb 19, 1934)

PROLAPSE OF THE RECTUM IN THE INSANE

GEORGE L FAIR, M D, *Oyster Bay*

It is curious that in the literature on the subject of prolapse of the rectum, the occurence of this disability in the insane is very little mentioned It is among the commonest elective operative procedures which I have had to perform in my seven years as visiting surgeon to the King's Park State Hospital One finds little reference to insanity as a precipitating cause of the defect among the many that are described It is interesting, however, that in a conversation with Mr Lockhart-Mummery, chief surgeon at St Mark's Hospital for Rectal Diseases in London, he stated that nearly all his cases were insane patients, in nursing homes for the same in and about that city

This paper deals entirely with the so-called intussusception of the rectosigmoid, complete prolapse or third degree prolapse.[3] I do not know the number of cases of mucosal prolapse or of the two preceding stages of complete prolapse (first stage, "concealed" prolapse, seen only by proctoscope, second stage, protrusion of rectum through the anus without involvement of the anus[3]) there are among the 5,000 to 6,000 inmates of this state hospital, as only the necessary cases are referred to surgery

Etiology

The age incidence of my patients was from thirty-one to fifty-six years, averaging forty-six Emaciation and loss of abdominal muscle tone strangely was not present in all cases—it was noticeable in only two One of the female patients (case 4) was actually well-nourished and slightly obese The role insanity plays in etiology probably relates entirely to constipation and sluggish, careless bowel habits, which were present in all The type of insanity showed dementia precox to predominate Seven of my eight patients were of this classification—one was a case of psychosis with mental deficiency and depression The history or examination did not elicit colitis, proctitis, neoplasm, stricture, hemorrhoids, damaged external sphincter, polyps, or parturition as a direct or precipitating cause

Fig 1-3 (barium enema x-ray of three of my patients) show the presence of redundancy of the sigmoid colon (1, 2) and atony of the colon (3) and suggest that they may have been a precipitating cause Incidentally one of the two cases which gave a recurrence was that of a patient whose x-ray is in Fig 3 Redundant sigmoid causing volvulus of the same was one of the commonest emergencies which I encountered in my seven years visiting King's Park State Hospital This serves to indicate the frequency of redundant sigmoid in the insane, whether or not it is a factor in prolapse

Anatomically Moschowitz's theory[2] that prolapse of the rectum is a hernia of the transversalis fascia is substantiated by the anatomical studies of Waldeyer,[5] and the clinical researches of Ludloff,[6] Zuckerkandl,[7] Napalkow,[8] Dix,[9] and others A representation of the anatomical relationship is shown in Fig 4 According to Moschowitz the prolapse is really a sliding hernia of the sigmoid colon Descent is at first prevented by the levator muscles and its fascia, and the perineal body, then arrest of descent by the posterior wall of the rectum, the sacrum and coccyx, causes it to change course and slide along the posterior wall of the rectum down and forwards, then backward toward and through the anus The lowermost part of the rectum being fixed, the prolapse enlarges by drawing in first the two lateral, then the posterior walls Further drawing in of the bowel is prevented by fixation of the organ This is why it never exceeds five to six inches which is the longest prolapse seen in my eight cases

That destruction or injury of the sphincter ani muscles is not a factor, is shown by the practically unknown occurrence of prolapse where these have been destroyed after infection or sloughing in extensive fistula-in-ano operations Jeannel and Verheuil have called attention to this

My observations in two of the eight

There was no clinical evidence of carcinoma of the testis or teratoid tumor elsewhere The shadow in the lung is not the usual appearance of a metastatic lung lesion Pathological specimen removed at bronchoscopic examination showed a squamous cell carcinoma of the lung, apparently primary in the lung and not metastatic

This case is of interest in that there was the development of large symmetrical breasts, apparently not due to lymphatic or lymph node obstruction, in an otherwise uncommon combination of conditions, tumor of the lung, and pulmonary tuberculosis Whereas enlargement of the male breasts is known to occur in neoplastic metastases to the lung, a careful search of the literature does not reveal the association of gynecomastia and primary tumor of the lung

Special Institutes on Syphilis for Practicing Physicians

The Medical Society of the State of New York in cooperation with the State Department of Health will hold one-day institutes on syphilis in seven cities

The courses will include instruction in the etiology, pathology, diagnosis and treatment of syphilis There will be practical demonstrations in clinical and laboratory diagnostic methods including darkfield examinations and the technic of preparation and administration of the various arsenicals and heavy metals The organization and administration of syphilis control programs will be outlined

Opportunity will be given attending physicians to discuss their individual problems with the visiting speakers

Ample clinical material will be provided Persons with typical symptoms of the various stages of syphilis and with unusual manifestations that will make differential diagnosis both interesting and instructive, will be secured and presented at the various institutes

Any licensed physician is eligible but preference will be given to those not residing in the larger cities Each institute will be limited to about twenty physicians in order that they may have individual attention during the intensive training Applications will be accepted in the order in which they are received except an attempt will be made to distribute ths quota evenly throughout the individual county and in the various counties according to their medical population

There will be no registration fee. The New York State Department of Health will pay a small honorarium to cover travel expenses to each attending physician except those residing in the cities where the institutes are held

Institutes will be given in the following cities

Albany May 26-27
Binghamton May 24-25
Buffalo April 26-27
Jamestown May 23
New York City May 23-24
Syracuse May 18-19
Watertown May 20

Any physician wishing to attend any of the institutes should file his application immediately with his D S H O or Thomas P Farmer, M D, Chairman of the Council Committee on Medical Education of the New York State Medical Society, 608 E. Genesee St., Syracuse.

ANOTHER WAR CHEST WE NEED

Cancer research has reached the stage, Dr James Ewing asserted recently, where its solution largely hinges upon the problem of finding sufficient funds

"These funds need not be very large, relatively speaking, considering the enormity of the problem and the incalculable amount of good that could be accomplished with it. When hundreds of millions are spent on battleships that grow obsolete in a few years, with more hundreds of millions on maintaining an army, $1,000,000 is indeed a small sum to spend on new weapons to fight one of mankind's greatest enemies"

PROLAPSE OF THE RECTUM IN THE INSANE

GEORGE L. FAIR, M.D., *Oyster Bay*

It is curious that in the literature on the subject of prolapse of the rectum, the occurence of this disability in the insane is very little mentioned. It is among the commonest elective operative procedures which I have had to perform in my seven years as visiting surgeon to the King's Park State Hospital. One finds little reference to insanity as a precipitating cause of the defect among the many that are described. It is interesting, however, that in a conversation with Mr Lockhart-Mummery, chief surgeon at St Mark's Hospital for Rectal Diseases in London, he stated that nearly all his cases were insane patients, in nursing homes for the same in and about that city.

This paper deals entirely with the so-called intussusception of the rectosigmoid, complete prolapse or third degree prolapse.[3] I do not know the number of cases of mucosal prolapse or of the two preceding stages of complete prolapse (first stage, "concealed" prolapse, seen only by proctoscope, second stage, protrusion of rectum through the anus without involvement of the anus[3]) there are among the 5,000 to 6,000 inmates of this state hospital, as only the necessary cases are referred to surgery.

Etiology

The age incidence of my patients was from thirty-one to fifty-six years, averaging forty-six. Emaciation and loss of abdominal muscle tone strangely was not present in all cases—it was noticeable in only two. One of the female patients (case 4) was actually well-nourished and slightly obese. The role insanity plays in etiology probably relates entirely to constipation and sluggish, careless bowel habits, which were present in all. The type of insanity showed dementia precox to predominate. Seven of my eight patients were of this classification—one was a case of psychosis with mental deficiency and depression. The history or examination did not elicit colitis, proctitis, neoplasm, stricture, hemorrhoids, damaged external sphincter, polyps, or parturition as a direct or precipitating cause.

Fig 1-3 (barium enema x-ray of three of my patients) show the presence of redundancy of the sigmoid colon (1, 2) and atony of the colon (3) and suggest that they may have been a precipitating cause. Incidentally one of the two cases which gave a recurrence was that of a patient whose x-ray is in Fig 3. Redundant sigmoid causing volvulus of the same was one of the commonest emergencies which I encountered in my seven years visiting King's Park State Hospital. This serves to indicate the frequency of redundant sigmoid in the insane, whether or not it is a factor in prolapse.

Anatomically Moschowitz's theory[2] that prolapse of the rectum is a hernia of the transversalis fascia is substantiated by the anatomical studies of Waldeyer,[5] and the clinical researches of Ludloff,[6] Zuckerkandl,[7] Napalkow,[8] Dix,[9] and others. A representation of the anatomical relationship is shown in Fig 4. According to Moschowitz the prolapse is really a sliding hernia of the sigmoid colon. Descent is at first prevented by the levator muscles and its fascia, and the perineal body, then arrest of descent by the posterior wall of the rectum, the sacrum and coccyx, causes it to change course and slide along the posterior wall of the rectum down and forwards, then backward toward and through the anus. The lowermost part of the rectum being fixed, the prolapse enlarges by drawing in first the two lateral, then the posterior walls. Further drawing in of the bowel is prevented by fixation of the organ. This is why it never exceeds five to six inches which is the longest prolapse seen in my eight cases.

That destruction or injury of the sphincter ani muscles is not a factor, is shown by the practically unknown occurrence of prolapse where these have been destroyed after infection or sloughing in extensive fistula-in-ano operations. Jeannel and Verheuil have called attention to this.

My observations in two of the eight

Fig 1 Twenty-nine months after sigmoidopexy operation Sigmoid colon markedly elongated and redundant (Case 2)

patients (Fig 1, 2) showing redundant sigmoid agrees with the statements of Martin,[8] namely that "a second or third degree prolapse cannot occur unless the

Fig 2. Twenty-seven months after Ball's sigmoidopexy operation. Very redundant sigmoid colon with apparently a long mesosigmoid (Case 4)

mesocolon has abnormal mobility" Attempts were made to take barium enema on other patients in this series postoperatively, but they would not cooperate sufficiently

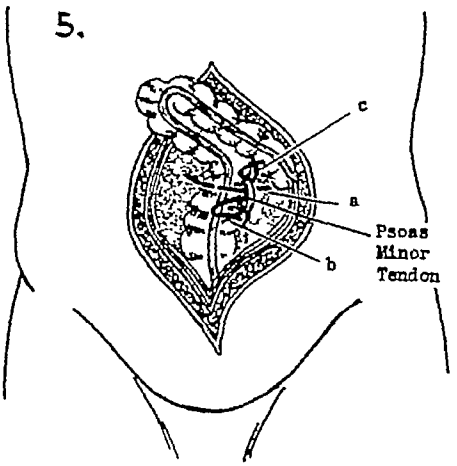
If insanity is a factor in the precipitating factors causing this condition, it may be of interest to note that the majority of seven out of eight patients were diagnosed as dementia precox (five paranoid, two hebephrenic in type)

Symptoms

All had prolapse with bowel movements None were noted on exertion as

Fig 3 Thirty-one months after first operation and four months before operation for recurrence. Well-defined prolapse and colonic atony Prolapse had been cured over two years after a second fixation. (Case 1)

they were not doing outside or manual work They all had incontinence of feces and a relaxed anal outlet Constipation of an obstinate nature was noted in all All were reducible at time of operation, but a few were giving increasing difficulty requiring cold applications and head-down position after bowel movements to effect reduction None were ulcerated on the mucosal surface Several showed marked edema of the bowel wall coats at operation



Treatment The many types of operation devised for this condition indicate the dissatisfaction with the end results

Amputation of the protruding segment is generally conceded in this country to be contraindicated except in cases of gangrene or when reduction is impossible, due to marked edema or induration Its higher mortality, technical difficulties, and the type of patient dealt with makes it an unsafe procedure here Percussion of the anterior wall of the prolapse, frequently gives tympany indicating the

Fig 4 Anatomical relationships of rectal prolapse.

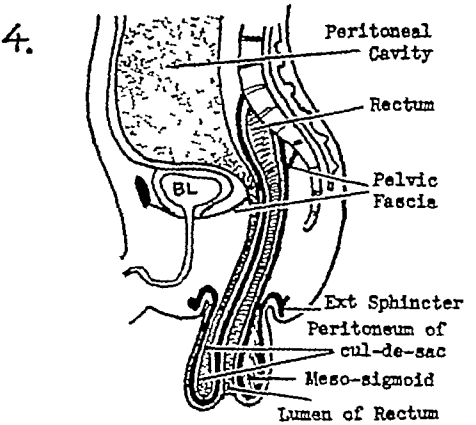


Fig 5 Pelvic colon held taut and showing placing of fixation sutures to tendon of psoas minor *Fine silk C*—Lateral border of retroperitoneal incision *Fine silk A, B*—Mesial border of retroperitoneal incision *Heavy silk B* —Longitudinal band to tendinous portion of psoas minor

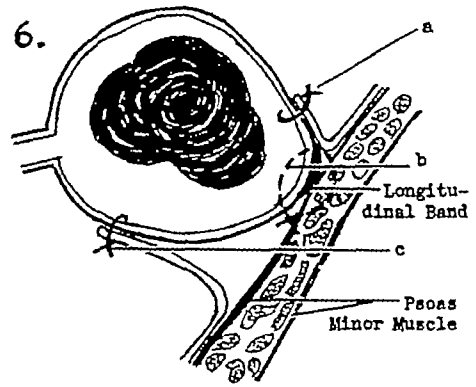

Fig 6 Cross-section showing placement of three rows of sutures as in Fig 5 (Letters are the same.)

herniation of small bowel between the walls of the prolapse Amputation of the prolapse from below by a "T" incision beginning ½" from the anal margin (Sir E Mile's rectosigmoidectomy) is the routine procedure at St Mark's Hospital for Rectal Diseases, London They advise a plastic operation on the external anal sphincter, six months later if necessary for anal incontinence

Rankin, Bargen, and Buie[10] at the Mayo Clinic recommend the Moschowitz operation, for closure of the pouch of Douglas In nine cases operated on by this method, they reported (1934) one death, seven cures, and one recurrence The operation is done on the basis that the prolapse is a hernia of the sliding type involving primarily the anterior wall of the rectum However, this requires the retention of a rectal tube for six to eight days In an insane patient it is extremely difficult to have this retained for more than a day or so As Rankin's only death was from

intestinal obstruction at the pelvic floor, it seemed an essential to this treatment As it could not be successfully done in my cases, I have felt obliged not to use the operation at all

Tamponade of the retrorectal space as advised by Lockhart-Mummery, was not considered, though an excellent operation, as it is not generally considered applicable to third degree (complete) prolapse

A modified Quenu operation was done on one patient in this series (case 3) by my senior associate, Dr F J Mc-

TABLE I

Number	Age	Mental Diagnosis	Date of Operation	Cured	Time of Recurrence	Died non-operative
1	31	Dementia Precox Paranoid	May 16, 1932 Re-operation May 4 1935	26 months	30 months.

Average			3 yrs. 1 mo		33 mos.	

* With re-operation on one recurred case, figures are seven cured and one recurred

Gowan, where a suture of the taut sigmoid to the back of the cervicouterine junction, followed by a ventral suspension of the uterus, successfully cured the prolapse for two years, when she died of chronic myocarditis

In selecting an operation to suit the conditions of an insane patient, frequently disturbed, very uncooperative, and in some cases emaciated, that of colopexy as described by Ball seemed the most probable to yield a successful end-result [4 11] My first four cases were done prior to the publication of Martin's article [3] My experience taught the same fact which he stresses—the secret of success is pulling the rectum up until it is *taut,* then fixing it to the psoas minor tendon or iliacus fascia

Colopexy Under preferably spinal anesthesia (recently I have used chiefly pontocaine-glucose technic to insure a 1½ hour anesthesia, as advised by L Sise [12] of Lahey Clinic), a left lower rectus incision is made. The patient is put in Trendelenburg position and the small bowel securely packed off A vertical incision (Fig 5) is made just above the brim of the true pelvis, external to the left common iliac artery and the left ureter The tendon of the psoas minor muscle and the ilio-psoas fascia are exposed for a distance of two inches

A mesial row (Fig 6) of fine interrupted silk sutures are then placed to unite the mesial edge of the incised peritoneum to the left lateral wall of the sigmoid colon, held taut. Still holding the colon very taut, the anterior longitudinal band is rolled outwards and backwards, while the lowermost suture of No 12 black silk is placed between the psoas minor tendon or (if it is absent or not definable, as it frequently is in women) to the iliacus fascia at the lowermost angle of the denuded area About six such sutures are then placed in a vertical direction in the same manner The lateral peritoneal cut edge is then united to the right lateral wall of the sigmoid to completely close the denuded area.

Postoperatively, I have not found it necessary to use a rectal tube, although I believe it would be useful in a sane patient They are kept with the foot of the bed elevated for two weeks and allowed out of bed in about sixteen days The bowels are tied up for five days postoperatively, then move with an oil enema A light soft diet may be given after this

The importance of the tautness of the sigmoid colon at the time of suture was strikingly demonstrated to me in the case of T P (Case 1) whom I operated on for a recurrence in May 1935 I found that the prolapse had occurred not from a stretching of the colopexy sutures, but from the failure to have fixed the colon sufficiently high After separating the suture line with difficulty, I was able to fix the bowel at least two inches higher and have to date achieved a cure (26 mos)

That emaciation is not a bar to the performance of this operation is shown by the fact that one of the patients, female, age forty-two, (Case 6) weighed at the time of operation only 81½ lbs She gained weight to 131 lbs, showing

the improved health which almost invariably follows these operations Eventually she died of pulmonary tuberculosis, with no evidence of recurrence, 1½ years postoperatively However, one of the recurrences it must be admitted, was in a patient who weighed 93½ lbs at operation She weighed 80 lbs at death from pneumonia Her recurrence did not appear until three years postoperatively

I have not found that a plastic operation on the external sphincter has been necessary in any of these eight cases Physical examination of three of the recovered cases in 1934 showed excellent sphincter tone None of the living have any incontinence whatever None of the other three (two deceased) were reported as having any There were no operative deaths Three have since died from illness unrelated to prolapse (Table I)

Summary

1 The results of seven cases of Ball's colopexy and one of modified Quénu operation for complete rectal prolapse of the third degree are described

2 The factors which obtain in insane patients making them peculiarly prone to rectal prolapse are described Redundant sigmoid with a long mesentery and colonic atony have been demonstrated in some and are among the factors mentioned

3 Emphasis is made of the necessity of having the sigmoid colon taut before it is suspended, to insure a cure

4 Obliteration of the pouch of Douglas is not a necessary step to cure rectal prolapse

REFRESHER COURSE IN VENEREAL DISEASES

The New York City Department of Health is offering to physicians a series of lectures on venereal diseases to be held each Saturday morning at 125 Worth St The schedule is as follows

April 16

9 30—Adolph Jacoby, M D, "Gonorrhea in the Female."

10 00—Reuel A. Benson, M D, "Vulvovaginitis"

10 30—William B Snow, M D, "Heat Therapy of Gonorrhea in the Female."

11 00—Leo L. Michel, M D., "Elliott Treatment of Gonorrhea in the Female."

April 23

9 30—Gerald F Machacek, M D., "Pathological Distinction of Granulomas of the Groin"

10 00—Borris A Kornblith, M D, "Treatment of Chancroid"

10 30—Arthur W Grace, M D., "Diagnosis and Treatment of Lymphogranulomavenereum."

April 30

9 30—John F Mahoney, M D—"Biology of Spirocheta pallida." Dark Field Demonstration and Movies

10 30—Louis Chargin, M.D, "Clinical Syphilis—Primary and Secondary" Clinical Demonstration and Movies

May 7

9 30—Bruce Webster, M D., "Clinical late Syphilis" Clinical Demonstration and Movies

10 30—Margaret L Davis, M D, "Congenital Syphilis and its Prevention"

May 14

9 30—Charles Walter Clarke, M D., "American Plan of Venereal Disease Control."

10 00—M. F Haralson, M D, "U S Public Health activities in Metropolitan area."

10 30—Oma H Price, M D., "Some special problems of New York City plan."

11 00—Henry P Talbot, M D "Prophecy and promises in Venereal Disease Control"

Preventive Medicine

Another Headache Remedy

B Liber, M D, Dr P H, *New York City*

Every individual or group or profession or even nation has some ridiculous angle and those with a sense of humor can, not only "take" some fun making, but may even welcome it for the wholesome lesson it may impart In that sense the celebrated Moliere was undoubtedly one of the greatest school-masters of the medical profession of his time. Behind his justified, always rollicking, mockery there was as a rule something true that contained not only a well-deserved spanking, but a serious teaching as well Take his hilarious *"Le Médecin Malgré Lui"* where the doctor—this time a layman who is forced to play the part of a physician —is so mishandled! Although this temporary would-be healer is short in Latin and anatomy and his apparent cure for the girl's sudden dumbness is bread and wine, because that is the food on which parrots thrive and learn to speak, a better, more causal, remedy is administered the satisfaction of her amorous desire, the mating with the man chosen by her against her father's will

While *most cases of organic or somatic illness* seen by any medical man, no matter what the diagnosis, *are mental cases also or contain mental elements* in their etiology or in their complications, *some show a preponderantly psychic side*

A woman complained of *headache*—intense, persistent, constant, generalized and not confined to any one portion of her skull She went to her family doctor He did his best to find the cause and, being unsuccessful, he prescribed something that is known to give relief But there was no change Not understanding the stubbornness of this symptom he took her at first to a gynecologist whose findings were negative and later to a specialist for internal diseases who examined her thoroughly and at length and discussed the case with her physician They agreed that a neurologist would be the right man Nothing remained undone, but the diagnosis was still unknown and, what was more important, no medication and no method of treatment or modification in the patient's routine had any appreciable and lasting effect.

She was a quiet, unassuming person, who far from exaggerating her condition, tended to minimize it She was not a smoker, never drank alcoholic beverages, and indulged in no excess of coffee She ate simply and moderately, kept correct hours, and attended to her housekeeping without overworking She had no children, she lived on the best terms with her husband and their sexual intercourse was adequate Her weight was more or less normal, so were her blood pressure, heart, kidneys, menses, bowel movements She was not anemic and her appearance was that of a healthy young woman

As the regular doctors failed, an appeal was made to irregulars, either recommended by friends or about whom the husband had heard at his business place One of them noticed a few small yellowish-brownish areas on the skin Of course, he could not know that *pityriasis versicolor* was a superficial, parasitic condition of no deep consequence and that, in that stage, it was curable within a few days So he gave them the popular and meaningless name "liver spots," assured the patient that the liver was at fault and started to "treat" it Another one tormented her in another manner—and so forth

All in all she had been tortured for about nine months when, tired of the irregulars, she returned to a member of the medical profession and presented herself to the last consultant, upon the advice of her own original doctor

Both physicians went over the case as carefully as possible. At first they re-examined the *organs* and *functions* As those yielded no clue, they studied the patient's living *habits* and finally began to analyze her *psyche* and *situation* at home and her *relationship* to her immediate environment They almost failed again, when, at the end of the interrogations she mentioned her mother There was an unusual glance. Something unpleasant was suddenly painted all over her face, as if a cloud had passed over her forehead, eyes and cheeks At the insistence of the examiner she balked It was felt that she made a great effort not to speak against her own mother But she could not resist the continual fire of detailed questioning and the truth was learned

She had never liked her mother, who was domineering and overbearing and had also ruled despotically over her husband until his death The old lady was extremely selfish and demanded much attention Each one of the children, now all married, feared her and tried to get rid of her by sending her

away to another brother or sister It was one year since our patient's turn came to give hospitality to her mother Patient was the youngest of the siblings and one of the wedding gifts she received when she married, exactly one year before, was her mother That was the cause of her sickness This mother's greatest joy was an endless *nagging* She was worse than the proverbial mother-in-law Nothing that the daughter did was well done There was no freedom for the young woman, as she was not permitted to leave the house or to see friends—except when her husband was at home or accompanied her Yes, this mother attempted even to denounce her daughter to her son-in-law and so disrupt a happy union Life was hell for this newly-married woman and many were the nights when she lay awake crying or when her sleep was filled with the most frightful dreams, some of which were revealed to the examiner

It was discovered that the headache invariably ceased when the mother happened to be absent from the patient's house for a day or two

The remedy, therefore, was to remove her altogether and, as no one of the children wanted her, she was sent to a decent home for the aged *That brought the cure* Our patient's headache disappeared and she became generally happy This is a true story

VITAMINS GOING WILD

The strangest and most extraordinary exploitation of vitamins, remarks Dr Morris Fishbein in *Hygeia,* has been their recent promotion in relationship to beauty, and here we find not only the established vitamins employed but also an alleged new vitamin, the existence of which actual scientific investigation does not even admit Among the first of these promotions was the inclusion of vitamin D in various ointments and particularly in soap Just why any one should put a vitamin in soap has not been apparent. Soap is really supposed to take things off the skin and not to put them on.

Incidentally, attempts are now being made to sell a cream which contains a glandular preparation that will cause wrinkles to fly right off the face. Just where the wrinkles go nobody knows

In various magazines, particularly those devoted to the so-called "fair sex," in recent months have appeared a number of announcements about a new vitamin called vitamin F, which it seems was discovered by a resident at various times of Chicago, with a medical record not susceptible of much verification It seems that he has evolved out of linseed oil some substances which are very important for rats Working with the assistance of two young ladies he found, for example, according to some of the claims, that sex can to a certain extent be made to order if parents desiring a boy will eat large quantities of vitamin E in addition to an otherwise balanced diet. The evidence is said to be based on 7,000 rat experiments What a jolly time these rats have in the interests of science!

Of course the experimenter is bound to be right half the time.

"TISSUE PAPER FACE"

A Belfast physician describes an interesting phenomenon in a letter to the *British Medical Journal* He writes

"In the course of my work I have performed many transilluminations and have been impressed with certain appearances which are observed in some cases In one type of patient the whole face is illuminated, so that one gets the impression that there is scarcely any bony structure One of my housemen described this appearance vividly as a 'tissue-paper face.' Over a number of years it has been my experience that this 'tissue-paper face' is found in the highly neurotic. I first made the observation when dealing with patients complaining of catarrh, but being impressed by the absence of all cause for this condition I began to feel that the catarrh was more imaginary than real, and to associate three conditions the complaint of catarrh, the 'tissue-paper face,' and the fact that these patients were highly neurotic. I wonder if the possible connection in this respect might be an error in calcium metabolism, a feature which is, I understand commonly met with in neurotic states I bring forward this observation in the hope that others may contribute their experience or draw my attention to any previous work on it"

Preventive Medicine

Another Headache Remedy

B Liber, M D , Dr P H , *New York City*

Every individual or group or profession or even nation has some ridiculous angle and those with a sense of humor can, not only "take" some fun making, but may even welcome it for the wholesome lesson it may impart. In that sense the celebrated Moliere was undoubtedly one of the greatest schoolmasters of the medical profession of his time. Behind his justified, always rollicking, mockery there was as a rule something true that contained not only a well-deserved spanking, but a serious teaching as well Take his hilarious *"Le Médecin Malgré Lui"* where the doctor—this time a layman who is forced to play the part of a physician —is so mishandled! Although this temporary would-be healer is short in Latin and anatomy and his apparent cure for the girl's sudden dumbness is bread and wine, because that is the food on which parrots thrive and learn to speak, a better, more causal, remedy is administered the satisfaction of her amorous desire, the mating with the man chosen by her against her father's will

While *most cases of organic or somatic illness* seen by any medical man, no matter what the diagnosis, *are mental cases also or contain mental elements* in their etiology or in their complications, *some show a preponderantly psychic side*

A woman complained of *headache*—intense, persistent, constant, generalized and not confined to any one portion of her skull She went to her family doctor He did his best to find the cause and, being unsuccessful, he prescribed something that is known to give relief But there was no change. Not understanding the stubbornness of this symptom he took her at first to a gynecologist whose findings were negative and later to a specialist for internal diseases who examined her thoroughly and at length and discussed the case with her physician They agreed that a neurologist would be the right man Nothing remained undone, but the diagnosis was still unknown and, what was more important, no medication and no method of treatment or modification in the patient's routine had any appreciable and lasting effect.

She was a quiet, unassuming person, who far from exaggerating her condition, tended to minimize it. She was not a smoker, never drank alcoholic beverages, and indulged in no excess of coffee She ate simply and moderately, kept correct hours, and attended to her housekeeping without overworking She had no children, she lived on the best terms with her husband and their sexual intercourse was adequate Her weight was more or less normal, so were her blood pressure, heart, kidneys, menses, bowel movements She was not anemic and her appearance was that of a healthy young woman

As the regular doctors failed, an appeal was made to irregulars, either recommended by friends or about whom the husband had heard at his business place One of them noticed a few small yellowish-brownish areas on the skin Of course, he could not know that *pityriasis versicolor* was a superficial, parasitic condition of no deep consequence and that, in that stage, it was curable within a few days So he gave them the popular and meaningless name "liver spots," assured the patient that the liver was at fault and started to "treat" it. Another one tormented her in another manner—and so forth.

All in all she had been tortured for about nine months when, tired of the irregulars, she returned to a member of the medical profession and presented herself to the last consultant, upon the advice of her own original doctor

Both physicians went over the case as carefully as possible. At first they re-examined the *organs* and *functions* As those yielded no clue, they studied the patient's living *habits* and finally began to analyze her *psyche* and *situation* at home and her *relationship* to her immediate environment.

They almost failed again, when, at the end of the interrogations she mentioned her mother There was an unusual glance Something unpleasant was suddenly painted all over her face, as if a cloud had passed over her forehead, eyes and cheeks At the insistence of the examiner she balked It was felt that she made a great effort not to speak against her own mother But she could not resist the continual fire of detailed questioning and the truth was learned

She had never liked her mother, who was domineering and overbearing and had also ruled despotically over her husband until his death The old lady was extremely selfish and demanded much attention Each one of the children, now all married, feared her and tried to get rid of her by sending her

Inexorable Fact

The past month has disclosed widespread dissatisfaction with the State Unemployment Insurance Act Even its friends admit it has proven administratively unworkable

Certain inherent flaws in the principle of the law have also come to light By the very nature of unemployment insurance, contributions drop precisely when the demand for benefits is greatest The result is naturally disappointing to those who had hoped this measure would prove a buffer against relief

There is also a growing realization that the law works an injustice on the low-paid workers Their contributions help to supply more substantial benefits than they themselves will ever receive to persons in higher income brackets It is true that the latter contribute more in dollars and cents, but proportionately the burden on them is less They are better able to pay the weekly levy on their salaries and to make personal provision for a rainy day

To physicians, who have studied the workings of compulsory health insurance in Europe, there is nothing surprising in these disclosures The discrepancy between theory and practice, in connection with obligatory insurance, is an old story The faults which are developing in the operation of unemployment insurance have repeatedly been stressed by organized medicine in warning against compulsory prepayment for medical care.

As a matter of fact, obligatory sickness insurance presents many more inherent difficulties than unemployment insurance It is almost impossible to formulate a sound actuarial basis for sickness protection Unemployment can be positively defined Its existence is easily established Deliberate malingering and hypochondria make it less easy to determine the presence of illness Besides, far more intangible elements enter into the provision of medical service than into the distribution of unemployment benefits

So far the operation of old age and unemployment insurance in this country has born out the profession's warnings against compulsory sickness insurance We have seen nepotism, graft, sloppy administration and high costs incommensurate with the scanty benefits obtained What impartial person can look in this direction for a system of medical care when medically sponsored plans in various communities have proven themselves infinitely more honest, efficient, and effective?

A Familiar Plaint

We don't need "time machines" or other fourth dimensional magic to persuade us that one century is much like

Highlights of the 1938 Annual Meeting

For Complete Program, see April 1 issue

(All activities will be held on Daylight Saving Time)

TIME AND PLACE—Opens Monday, May 9, 9·00 A M, at the Waldorf-Astoria Hotel, between Park and Lexington Avenues and 49th and 50th Streets, New York City Closes Thursday, May 12, 10 30 P M This will be the largest State Medical Meeting in size and scope ever held, and probably the largest attended Medical Meeting in the United States this year

REGISTRATION—Registration will be held in the Hotel on Monday after 9 00 A M for Delegates, and on Monday, Tuesday, Wednesday, and Thursday for members and guests Every physician must register and obtain an official badge to attend sessions

BUSINESS—The House of Delegates of the Medical Society of the State of New York will convene at 10 00 A M on Monday in the Ballroom

GENERAL SESSIONS—Two General Sessions will be held, one on Tuesday, 2 00 P M, and one on Thursday, 2·00 P M, in the Ballroom

SECTION MEETINGS—Fifteen Scientific Sections will hold twenty-eight sessions on Tuesday morning, Wednesday morning and afternoon, and Thursday morning in the hotel *(See complete program for locations)*

GUEST SPEAKERS—Twenty-eight prominent guest speakers in all fields of medicine will address General and Section Meetings

SCIENTIFIC EXHIBITS—Fifty-six scientific exhibits, to be located in the First and Second balconies of the Ballroom and the Second floor foyer, are a part of the program

SCIENTIFIC MOTION PICTURE EXHIBIT—Forty-four scientific motion pictures by twenty-five exhibitors will be shown in the Empire Room from 9 00 A M Monday until 10 15 P M Thursday evening

TECHNICAL EXHIBITS—One hundred and ninety-two exhibits of leading pharmaceutical, surgical, and allied products and services will be open during convenient hours throughout the convention This will be the largest number of exhibitors ever to take part in a State Medical Meeting For the benefit of physicians with office hours which do not permit spending much time at the meeting during mornings and afternoons, the exhibit rooms will be open until 10 30 P M on Tuesday

BANQUET AND DINNERS—The Annual Banquet and Reception will be held in the Ballroom of the Hotel on Tuesday, at 7·00 P M (Tickets are limited—application should be made to Augustus Harris, M D, Chairman of Banquet Comm, 2 E 103 St, New York City) Dinner for the Delegates will be served in the Hotel on Monday following the adjournment of the afternoon session of the House of Delegates (Tickets can be procured from the Secretary of the State Society, 2 E 103 St, New York City)

WOMAN'S AUXILIARY—Headquarters are in the Carpenter Suite of the Hotel, and the ladies are asked to register at the Registration Desk in the Suite after 9 00 A M, Monday Meetings and the Dinner will be held on Monday A hobby show will be open during the four days of the Annual Meeting, May 9, 10, 11 and 12

them to this decision A picture entitled "Your Life Is In Their Hands" would have done the medical profession more harm than any good from the expose of quackery and quacks, the records of which are on file

---

Blood Dyscrasias From Occupation

Industrialization has brought in its train a whole series of diseases which can be attributed directly to the occupation in which the worker is engaged Numerous physical and chemical agents are required in the manufacture of certain products which agents are detrimental to the health of the individual Lead, for instance, is employed in over 150 industries (paints, storage batteries, drinking utensile, and many others) Another powerful poison, benzol, is used in all the rubber industries

Held and Lieberson[1] emphasize the necessity of the early recognition of blood dyscrasias in those who come in contact with x-ray, radium, lead, and benzol in the course of their daily work Each of these attacks a definite part of the hematopoetic system, at the onset of the disease Lead depresses erythroblastic activity, benzol produced a leukopenia, while radioactive substances affect the hemolymph glands and cause a lymphocytosis Held and Lieberson stress the importance of recognizing the ill-effects of these drugs during this early stage of the blood dyscrasia because during this time the disease is *reversible* by removing the causative factor and by following adequate therapeutic measures To wait longer is to invite a severe form of the disease which responds poorly, if at all, to treatment To the reversible leukopenic stage of benzol poisoning there is added an aplastic anemia if the poisoning is permitted to continue The hemorrhagic diathesis which develops in the later stages of exposure to radium often defies all means of therapy

Unlike the cases of spontaneous blood dyscrasias, those which result from occupation show a long period of dysfunction in only one branch of the blood system and it is this factor that enables the physician to attack the disease early and be reasonably assured of restoring the blood picture to normal The complete removal of the patient from contact with the chemical is essential Periodic examinations of the blood of all workers in industries which utilize agents capable of inducing a blood dyscrasia should be made a public health law Only in this manner will susceptible individuals be spared a serious disease, because it not only is preventable but curable when it is properly treated in its early stages

1 Held I W and Lieberson, A N Y State Jour. Med, 38 186, 1938.

Perirenal Insufflation

Enormous strides have been made in the roentgen diagnosis of soft tissue tumors by use of contrast media We have attained the greatest accuracy by this means of study, in the detection of new growths of the gastrointestinal, urinary, and gall-bladder tracts More recently, the use of air injected into the cerebrospinal fluid system has increased materially the ability of the neurologist to diagnose and localize intracranial and spinal cord tumors

In 1935, Cahill[1] injected air into the perirenal space in order to outline the adrenal glands in cases where these structures were suspected of a new growth Within the past year, Mencher[2] has elaborated upon the technic of perirenal insufflation and has definitely determined its value in cases of paroxysmal hypertension, masculinism, and Cushing's syndrome The air, which is introduced by means of a needle attached to a delivery system and inserted into the perirenal space, outlines the kidney and adrenal and enables one to visualize a tumor mass in this area with the x-ray

Incidental to his work with perirenal insufflation, Mencher has noted that it is possible to obtain a positive air outline

1 Cahill G F *Jour Urol*, 34 238 1938

another In a recent issue of the "Friends' Quarterly Examiner," Cyril C Barnard puts a 1714 datemark on the so-called "New Deal" in medicine

Social workers today proclaim with the voice of discovery that a substantial proportion of the public is compelled by poverty to go without medical care Over two hundred years ago the Quaker John Bellers made the same observation Without the aid of million-dollar surveys, he found that three-quarters of the people were too poor to secure either medical care or necessary drugs

On its surface, this would appear to be a serious indictment of government and the medical profession Over two hundred years ago, three-quarters of the people were going without essential medical services, and they are still going without them today Strangely enough, in spite of this alleged neglect, the span of life has been steadily lengthening in the past two centuries Both general and infant mortality have been strikingly reduced and many diseases have been virtually eliminated from the morbidity tables

Considering this paradox, one is forced to the conclusion that either medical care is an unnecessary luxury or the figures cited by Friend Bellers and his modern protagonists are somewhat exaggerated When the progressive drop in morbidity and mortality is traced to its exact causes, it becomes apparent that there is no such general dearth of medical service as some reformers, dead and alive, would have us believe

It is noteworthy that the path Mr Bellers blazed in 1714 in his remarkable "Essay Towards the Improvement of Physick in Twelve Proposals" is still considered the true road by most of the modern prophets of public health He urged the creation of public hospitals and laboratories, the appointment of county physicians to care for the sick poor and governmental endowment of medical research Especially remarkable is his evaluation of sickness in economic terms in an age when misfortune generally evoked either sentimental condolence or pious admonition

Viewed in the light of his affinity with present day sociologists, John Bellers appears as much of an anachronism in his century as Mark Twain's Connecticut Yankee at King Arthur's Court History's well-known tendency to repeat itself reassures us, however Probably Mr Bellers was quite comfortable in 1714 even though he seems to us to have been two hundred years ahead of his time Maybe, even—heretical thought!—the medical "radicals" of our own day are not quite as revolutionary as they and the rest of the world seem to believe!

A Gratifying Response

In our issue of January 1, 1938, there appeared an editorial called "Hollywood on Crusade" The purport of it was to inform our readers that a certain motion picture concern "is about to embark on another crusade This time it will be a picture exposing and denouncing quack doctors" Furthermore, the announcement stated that the concern would "work in cooperation with the American Medical Association, whose aid has been pledged by Dr Morris Fishbein" We then expressed doubts as to the wisdom of the procedure, looking with concern on the tendency of Hollywood toward theatrics, and fearing that it would bring discredit on the whole profession from the undiscerning

In *The New York Times* of April 3, we find the following "Because of protests from medical bodies throughout the country the Warners have abandoned their contemplated production of 'Your Life Is In Their Hands', an expose of quack practitioners which was to have found its source in the files of Dr Morris Fishbein of the A M A The objections pointed out that reflection would be cast upon the entire medical profession, so the studio shelved the story rather than stir up a controversy"

We are glad indeed that the second thought of Warner Brothers brought

Federal Pure Food and Drugs Legislation

New York City
333 E 57 St.

To the Editor

The National Pure Food and Drugs Act now on our statute books is dated 1906, and was passed then only after a crusade of years' duration, carried on by Dr Wiley There have been but few amendments to that Law in the last thirty-odd years, so we are still living under antiquated legislation on that important subject, and there is no national legislation covering cosmetics

Several bills have been introduced into Congress in the last six years, and all have failed of enactment into law, largely because of a very strong lobby working against the passage of such legislation

An extremely weak food, drug, and cosmetic bill is now before the Congress Among its many weaknesses are the clauses which place the control of advertising in the hands of the Federal Trade Commission. All administrative authority, including advertising, should be placed with the Food and Drugs Administration, under the Department of Agriculture, if the people of this country are to be protected against harmful or worthless preparations The recent tragedy resulting from the use of the elixir sulfanilamide, which took the lives of well over sixty individuals would have been prevented, had proper laws been in force controlling the production of such preparations

There are numerous harmful drugs purchasable without prescription, and an entirely new group of diseases has grown out of the indiscriminate use of these drugs by the laity

It should be pointed out that quite as much harm can come in a negative way from advertising which makes false or fraudulent claims, in that an individual with a disease in an early and curable stage may waste valuable time experimenting with a nostrum, with the result that the disease is no longer curable when proper medical care is resorted to

Great strides have been made in the last half century in the prevention of disease, and in increasing the expectancy of human life. The present situation in the Congress of the United States is a challenge to every physician in the country, one of whose functions should be the protection of the people from the use of improper food, drugs, cosmetics, and devices

It is to be hoped that every physician will communicate with Senator Royal S Copeland and with Representative C F Lea, in Washington, D C, who are in charge of their respective branches of the Legislature, with reference to the Food and Drugs Act, and also to the representative from his respective congressional district and the senators from his state, protesting against the inadequacy of the present law, and demanding national legislation which will be dictated by an honest desire to provide certain needs of the American people, and will take the Food and Drugs Act out of the hands of politics

MALCOLM GOODRIDGE, M D

March 12, 1938

Chronic Appendicitis

Merribrooke Farm
Stamford, Conn.

To the Editor

In the interesting and valuable Ray article on appendicitis in the NEW YORK STATE JOURNAL OF MEDICINE for March 15, I was surprised to find on page 422 that in chronic appendicitis the pain and discomfort are in the right lower quadrant of the abdomen. In my articles on chronic appendicitis in my fifty years in the Academy of Medicine library and in medical libraries rather generally here and abroad, I took particular pains to show that in chronic appendicitis the pain and discomfort are not in the lower right quadrant of the abdomen and care was taken to show why these symptoms are quite elsewhere.

I have been present when expert consultants upon whose opinion much depended and yet they did not know how to make a diagnosis between acute and chronic appendicitis in most cases when symptoms were not well-defined I remember that on one occasion Dr Reginald Fitz of Boston who gave the disease its male (hybrid) name asked me to make a diagnosis in one of his cases at the Massachusetts General Hospital I could not keep him out because it was before I had realized the need for a comprehensive study of the subject.

There are five well-defined kinds of

of the mediastinum Thus, a new field in roentgen diagnosis is opened for the recognition of mediastinal lesions by the use of a contrast substance The selection of the perirenal route for the injection of air is recommended over the paravertebral route because it is less hazardous The air finds its way into the mediastinum through the aortic opening in the diaphragm In addition to the merit of this method in adrenal and mediastinal tumors, the subdiaphragmatic regions can also be investigated, since it is possible to distinctly delineate both leaves of the diaphragm Oxygen or carbon dioxide are equaly effective as gaseous contrasts and they may be used in place of air With the more extensive use of perirenal insufflation, a greater degree of accuracy in the diagnosis of the lesions for which it is indicated may be looked for

CURRENT COMMENT

"IN THESE DAYS WHEN revolutionary changes are occurring in business, banking, labor relations, agriculture and transportation, and with the influence and power of Government to regulate economic activities, to referee disputes and to dictate policies, it is inevitable that we in the various professional fields must examine critically the role which our several professions are likely to play in the present and future social order. All of us have a more or less common group of problems, not only in relation to the community but also in regard to the functions of the universities, to which the country at large must look in the future for much of its leadership All of us are interested in the problems of health for they are with us from birth and throughout the entire span of life.

"The history of medicine, like that of other human institutions, is the history of individuals From the beginning of the human race certain individuals were recognized as having the power or knowledge to cure the sick and to treat the wounded Medical care has always been a function of society

"—Dean Willard C. Rappleye of Columbia's College of Physicians and Surgeons, quoted in the *Columbia University Quarterly* The remarks were made over two years ago, but are still pertinent.

" STATE MEDICINE, IN MY OPINION bears disaster for doctor and patient alike. you cannot pipe out medicine to the community as you do with steam heat in New York City I feel that private practitioners, by broadening their relationships with their patients, instead of becoming emergency men and merely curative physicians, can become in the best sense of the phrase guardians of the health of the people.

"For preventive medicine to be effective, other fundamental social problems must first be settled What, for example, is the object of subjecting a poor student to elaborate dental examination, when he or she has a father out of work and isn't receiving enough nourishment at home to form good sound teeth? An appalling inconsistency

" I know the futility of speaking grandiosely of sweeping reforms, of demanding the demolition of our present structure and the erection of a new one overnight. And I distrust the man with a pet scheme, the panacea We must realize that changes come gradually We must be grateful for small but localized improvements in our medical system, improvements effected, possibly, without the consciousness of the ultimate objective."—Sound statements from the radio address of Dr A. J Cronin, our English colleague and author "The Citadel."

"I DO NOT SAY THAT no drugs are useful, but there is not enough discrimination in their use."—Sir William Gull

"DEMOCRACY IS BEING CHALLENGED at home and abroad and the shame is that many criticisms directed at the system are justified. One cause for deserved criticism is that millions of men and women do not take politics or government seriously Democracy must be salvaged, or else the measured tread of armed guards will become familiar, free speech, freedom of enterprise and cherished liberties will vanish from the face of our fair land, and regret will prove of no avail"—From a letter to *The New York Times* under date of March 27, by Walter I Priest of Bluemont, Virginia

"THE NATURAL TENDENCY among scientists to carry any new theory or practice to extremes has not been discouraged by the manufacturers of biological products, so that the virtues of immunization in many lines have been greatly overrated, under pressure of commercial interests While this wave is by no means spent, it is believed that its crest has passed, and that immunization will in the future be regarded more in the light of its true rather than inflated values"—*The Health Officer*

Public Health News

Education For Marriage

J Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

On March 12 the New York State Conference on Marriage and the Family met under the chairmanship of Dr Sidney E Goldstein in New York City A part of the sessions were devoted to considering the progress of education for marriage and family life in the colleges and high schools of the state. A questionnaire had been sent to the 174 colleges and high schools of the state and at the time of the meeting only seventy replies had been received. These showed, however, that the educators of the state are quite generally conscious that education for marriage is a part of their responsibility All of the colleges replying and all but one of the high schools claimed to make some provision in this respect Little seems to be known, however, as to the content of the courses given It is obvious that this must vary widely from one institution to another Many of the courses are given in the department of home economics, in some colleges, however, the subject is handled by the department of ethics and in still others it is not confined to any one department but approached from several different viewpoints Three colleges go so far as to say that preparation for family life is the central core of the entire curriculum

It is probable that any medical man would be critical of these courses in their present stage of development Thinking it would be interesting to know what should be taught in the way of preparation for infant care to the high school and college student, I asked Dr Elizabeth M Gardiner, Director of the Department's Division of Maternity, Infancy and Child Hygiene, for her advice Dr Gardiner was not prepared to outline any course to be given in high school in the present stage of our educational development. We introduce our children to science at too late an age, she believes The subject should be taught early in the grades and there is no more fascinating branch of science than the biology of reproduction At some future date when children in high school are already familiar with the simple facts of fertilization, pregnancy, and parturition, and have an objective attitude toward these facts, it will be possible to teach preparation for parenthood in high schools At the present time high school students may learn the technic of infant care through their departments of home economics This instruction is probably given already in many schools Those schools which have a department of ethics no doubt offer courses in the current ideals of family life. It would be perhaps desirable if more high schools had instruction in ethics

The college student, says Dr Gardiner, is in another category More mature emotional control has been achieved and the problems of human genetics and human reproduction are talked about impersonally and without reserve. If the previous courses of instruction had been satisfactory, the most advantageous teaching in college groups would be through discussion

The above represents, of course, only one of several medical aspects of education for marriage. Any course which broaches the psychology and physiology of reproduction must have the widest contact with adult human experience One cannot help thinking, for example, what such courses properly conducted might accomplish in preventing a social misfortune which recently drew wide public attention I refer to the commission of sex crimes against women and children The Honorable Austin H MacCormick, Commissioner of Correction, New York City, tells us that from August 1 to September 15 of last year twice as many men charged with sex offenses were admitted to Riker's Island Penitentiary as during the same period in 1936 So active were the police and the public in their search for suspicious actions that "for a while," says Mr MacCormick, "it was utterly unsafe to speak to a child on the street unless one were well-dressed and well-known in the neighborhood To try to help a lost child with tears streaming down its face, to find its way home would, in some neighborhoods, cause a mob to form and violence to be threatened" The Commissioner believes, as surely all of us must believe, that sex offenders are mental patients requiring hospitalization rather than imprisonment but since there is no room in our hospitals at present for these cases he does his best with the facilities provided on Riker's Island. He says, "If substantial additions could be

chronic appendicitis Making the general diagnosis of the condition is a simple matter, but determination of which of the five kinds is present in any given case requires the clinical sense of a real doctor—not only his clinical sense but sometimes skilled employment of instruments of precision

I was not the one who named the Morris point for chronic appendicitis for comparison with McBurney's point in acute cases, my friends got to applying a name to the condition which I have described at length

ROBERT T MORRIS, M D

March 18, 1938

Dr Fishbein Clarifies the Situation

The Journal of the
American Medical Association
535 No Dearborn St,
Chicago, Ill

To the Editor

The editorial appearing in this issue of the *New York State Journal of Medicine*, page 650, entitled, "A Gratifying Response," has just reached me. It was unfortunately written without any attempt on your part to discover the actual facts behind the decision by Warner Brothers not to make the movie, entitled, "Your Life Is in Their Hands" You have accepted the statement of the studio publicity department, which apparently was endeavoring to get out from under what was for them a ticklish proposition

The motion picture which had been planned, and the scenario which had been prepared, were planned wholly to inform the public of the manner in which charlatans impose upon them by the use of the typical methods of charlatans, which have been described from time to time in various publications

When it was announced that this film was to be made, the American Optometric Association, as well as the osteopaths and chiropractors, were circulated and each one of them asked to send to Warner Brothers an individual protest against the making of the film Inasmuch as these groups are organized on a business basis in contrast with the organization that exists in scientific medicine, the result was a considerable number of letters to Warner Brothers protesting against the making of the film and carrying threats of legal action

I may say for the scenario that it was prepared by two competent writers, that there was not a libelous statement in it, and that unquestionably the information that it contained, had it reached any considerable number of people, would have done great good in distinguishing between the competent, ethical doctor and the charlatan

I am sorry to say that your editorial is incompetent, because it is based on inadequate information I hope you will publish this statement, which is sent for that purpose

Very truly yours,

MORRIS FISHBEIN

April 11, 1938

[NOTE We regret that the information regarding the American Optometric Association, the Osteopaths, and the Chiropractors were not available to us when our editorial was written. We surmised the situation however, and the end-results please us nevertheless —EDITOR]

SILICOSIS LESS THAN EXPECTED

Approximately 2 7 per cent of the 12,000 foundry workers in New York State are affected with silicosis, and of this number about 0 7 per cent show signs of tubercular complications, Elmer F Andrews, State Industrial Commissioner, and Dr Leonard Greenburg, Executive Director, Division of Industrial Hygiene, reveal in releasing a report on the most searching study of this industry ever attempted by any agency

Mr Andrews expressed the opinion that while the silicosis hazard in the foundry industry in this State is existent, it is of a mild degree of severity and may be expected to yield satisfactorily to appropriate measures of control He pointed out that the incidence of the disease as disclosed by the study is much less frequent than many previous surveys have indicated He stressed the fact that the foundry industry was selected for investigation not only because its workers are exposed to silica dust, the cause of silicosis, but also because it has the largest number of persons in any *single trade exposed to this dust*

According to the report, 110 cases of silicosis were discovered in the group of 4,066 persons examined Of these, eighty-eight or 2 2 per cent were in the first stage, sixteen or 0 4 per cent were second stage, and six or 0 1 per cent were third stage silicosis Of the 110 cases fifteen or 0 7 per cent showed signs of tuberculosis

culin before and after the disease. However, a change in the type of the reaction was noticed in several None of the mumps patients showed reactivation or exacerbation of their tuberculosis

Of the thirteen cases with scarlet fever, only one showed a spread of the tuberculous process None of the six cases of diphtheria experienced any ill effects so far as their tuberculosis was concerned The children with scarlet fever and diphtheria were not tested with tuberculin.

In the discussion, the author points out that only twelve children of the 118 showed any increase in the tuberculous lesions during convalescence. This closely parallels the experience of similar groups of patients whose tuberculosis was not complicated by acute contagious diseases In the great majority of those who showed increase in tuberculosis, the extension occurred several weeks after the intercurrent disease had subsided None of these remissions occurred in quiescent or apparently arrested lesions showing that the old foci were not disturbed by the intercurrent contagious disease. The remissions seen in the active tuberculous lesions could be safely considered coincidental and unrelated to the contagious disease.

Very little evidence was found to support the contention that measles or any of the other contagious infections have a depressing effect on the body's capacity to react to tuberculin. In the majority of previous studies the Pirquet method was employed for giving the tuberculin test. This may explain the apparent discrepancy, because the Mantoux test which is more precise, was used in all of the author's cases

Summary and Conclusions

1 A group of 118 children convalescing from tuberculosis who developed acute contagious diseases was studied.

2 No definite evidence was found to support the prevalent belief that measles, chickenpox, whooping cough, mumps, scarlet fever and diphtheria have a deleterious effect on tuberculous lesions in the lungs of children

3 No definite evidence was found to support the belief that the above diseases depress allergy to tuberculin in a child with healed or active tuberculosis

4 Further data were discovered to strengthen the contention that exacerbations or remissions are fairly common occurrences during the course of childhood-type tuberculosis and that they may occur in the presence or absence of intercurrent contagious diseases

DANGER AHEAD

A New York judge recently imposed a fifteen-dollar fine for passing a red light on a motorist who admitted illiteracy, notes the *Medical Week* At the same time he criticized severely the system which permits drivers who cannot read or write to operate cars No matter how competently a motorist handles his machine, he is not a safe driver if he cannot read certain warning signs

In technical fields allied to medicine there is a parallel to this situation Many registered physiotherapists consider themselves qualified to practice medicine because they can operate their apparatus, although they are completely unable to read danger signals in a patient's condition or make a diagnosis It is a sad and well-known fact that physicians often employ commercial x-ray and clinical laboratories whose technicians do not know how to interpret the signs set before them

Whether in driving or medical practice, a certain amount of knowledge is necessary besides mastery of an inanimate machine. It is doubtful, however, whether the illiterate motorist is nearly as dangerous as the lay technician who takes to the medical road without being able to read warning signs

---

St Faith's House renders a service to the unmarried mother for a long enough stay to insure her prenatal, confinement, and postnatal care and, after its birth, the care of the baby

It is incorporated under the Department of Social Welfare of New York State and is endorsed by the Judges of the Children's Courts, many of the medical profession and various well-known organizations

To be admitted to the house, a girl must be white, Protestant, and free from disease. Admissions are made directly through the Worker-in-Charge, at St. Faith's House, 53 So Broadway, Tarrytown-on-Hudson (Telephone 258)

A report of the house will be furnished upon request.

made to our psychiatric staff, we could do many of the things that one expects of hospitals or clinics." He has some hopes of being able by diagnosis to segregate the small minority of really dangerous sex offenders but the treatment of the large total number is another matter

This brings me back again to the possibilities of adequate education for marriage in youth and I will close with a last quotation from Commissioner MacCormick "Until the attitude of the people as a whole toward sex is more rational, until it can be discussed more frankly and more intelligently, until people realize more fully what damage repressions and complexes and maladjustments can do to a normal human mind, and until we approach the problem with sustained intelligence rather than in bursts of occasional hysteria, we must expect sex offenses to constitute a major problem for society" *

* MacCormick, Austin H, Honorable "New York's Present Problem," *Mental Hygiene*, p. 4, January 1938.

The Effect of Contagious Diseases on Tuberculosis

An attack of acute contagious disease in a child infected with tubercle bacillus is something nearly every physician dreads It has long been taught that measles, whooping cough and influenza predispose to tuberculosis and aggravate existing clinical tuberculosis If is also commonly said that the acute contagious diseases, particularly measles, depress or obliterate the child's capacity to react to tuberculin These opinions, seldom supported by convincing facts, have recently been challenged J P Nalbant reports on a study made of 118 children convalescing from tuberculosis who developed acute contagious diseases while in the sanatorium

Several writers state that during an attack of measles the tuberculin test becomes negative Some assert that intercurrent infections, particularly measles, stimulate activity in many cases of tuberculosis In one series of thirty-seven cases of tuberculous children who developed measles, the tuberculin test done by the Pirquet method showed that the reaction became negative in all at the appearance of the eruption, but became positive again in half of them by the seventh day Other writers express different views Chadwick, for example, found that a group of tuberculous children who reacted positively to tuberculin showed no change roentgenologically and no change in their tuberculin reactions during and after measles Berghoff studied 596 cases of measles in the army and found only one case of frank active tuberculosis following directly after measles infection

Effect of Contagious Diseases Exaggerated

Scattered studies made in Europe to determine the effect of whooping cough, chickenpox, scarlet fever and measles on the tuberculin reaction, and on active or inactive tuberculous lesions, indicate that the effect of the contagious diseases on tuberculosis has been exaggerated and may be very doubtful This supports the findings of the author in a study made at the William H Maybury Sanatorium, which included forty-three children with measles, thirty-nine with chickenpox, sixteen with whooping cough, thirteen with scarlet fever, thirty with mumps, and six with diphtheria, making a total of 147 cases of acute infectious disease in a group of 118 children convalescing from pulmonary tuberculosis of the childhood-type The ages of the children ranged from six months to fifteen years All had x-ray examinations of the chest a short time before the onset of the contagious disease and directly after the expiration of the quarantine period. Eighty-three of the 118 children had active pulmonary tuberculosis of the childhood-type, the remaining thirty-five had quiescent or apparently arrested disease

In four of the forty-three cases of measles the intracutaneous tuberculin test with Old Tuberculin became negative to a dose to which they were positive before, but were again positive two weeks after the disappearance of the eruption Six cases, showed by roentgenological examination, an increase in the pre-existing tuberculous process but none of these occurred in less than one month after the measles In each instance the exacerbation of the tuberculosis was an evanescent occurrence and all recovered completely in a few months

Two of the sixteen children with whooping cough showed exacerbation of the tuberculous disease In one case this occurred during the course of whooping cough but subsided promptly Three of the cases of chickenpox experienced extensions of their tuberculous lesions none of them showed any change in the tuberculin reaction Of the twenty-five children with mumps, twenty-four were positive to tuber-

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

JEFFERSON COUNTY On March 10 the Woman's Auxiliary of the Jefferson County Medical Society had their monthly dinner meeting at the Black River Valley Club in Watertown Thirty-six members were present.

Mrs Harlow G Farmer, President, presided Dr Charles A Prudhon, Secretary to the Jefferson County Medical Society, spoke on Legislature trends Dr John M Rice, Chairman of the Legislature Committee, spoke on current legislation before the New York Legislature Members were asked to write their representative in the New York State Legislature concerning the bill before the Legislature.

It was decided to write letters approving the Nurse Practice Act, Physicians Lien bill, the Esquirol-Hawkins Radiology bill, and disapproving the Peterson Chiropractor bill, the Health Insurance bill, and the Feld Medical Licensure bill

Mrs Walter Fox Smith, who attended an Auxiliary meeting in Syracuse, read Doctor Goodrich's address on Preventive Medicine entitled "Beauty and Health"

ROCKLAND COUNTY The Woman's Auxiliary of Rockland County held its regular monthly meeting on March 16 at the Hotel St. George in Nyack

In the absence of Mrs R F Sengstacken, Chairman of legislative affairs, Mrs J C Dingman gave a report of the recent recommendations sent by the Auxiliary to the State Legislature relative to subjects pertaining to medical interests

Mrs S W S Toms, who as State Chairman of public relations had attended the recent Executive Board Meeting in Syracuse, gave a report of this meeting

Mrs A. N Selman, President, appointed Mrs John J Rooney, Jr, to serve on the State Publicity Committee during the State Convention in New York City in May

SUFFOLK COUNTY Mrs William Barnhardt of Islip was honored on March 21 at the Sturrup Cup Castle, Oakdale, at a testimonial luncheon given by the Woman's Auxiliary to the Suffolk Medical Society She was presented with an attractive bouquet of roses by Mrs Stanley P Jones who expressed the esteem of the Society for Mrs Barnhardt's long and interested service as past president.

Mrs S K. Oxholm outlined in an interesting manner the history of medicine and surgery She spoke of the highlights through the ages from many years before Christ to the present time.

An amusing recitation was given by Mrs E Raymond Hildreth

Mrs John L Bauer read a delightful poem written by Mrs Barnhardt entitled "God's Poem"

QUEENS COUNTY The fifth anniversary of the Woman's Auxiliary to the Medical Society of the County of Queens was celebrated by a tea on March 23 at the Society Building in Forest Hills

Among those guests who were welcomed by the President, Mrs Elmer Kleefield, were Mrs Frederic E Elliott, President of the Kings County Auxiliary, Mrs Stanley P Jones, President of Suffolk County Auxiliary, Mrs Luther H Kice, Chairman of Legislative Committee of the State Auxiliary, Mrs Henry Hirsch, Recording Secretary of the State Auxiliary, and Mrs Milton B Bergmann, Publicity Chairman of the State Auxiliary

LETTER FROM MRS EDWIN A. GRIFFIN, CONVENTION CHAIRMAN With winter fast slipping away, in a few days we shall look for the return of the birds and the smell of soft damp earth and then our plans shall be for happy days ahead. Yes, we are planning for four very happy days ahead Our State Convention will be held at the Waldorf-Astoria Hotel, New York City, May 9-12 in conjunction with the 132nd annual meeting of the Medical Society of the State of New York. Your State President, Mrs Francis R. Irving of Syracuse met me this week to make plans and we have many good times in store for you whether you are an Auxiliary Member or not. If your thoughts will just turn to the Waldorf-Astoria and if you will keep May 9-12 in mind I am sure you will find many friends, both old and new Interesting meetings to attend and our Hobby Show, which compares most favorably with any to be seen anywhere at any time will occupy an hour or more of your time We have a delegates dinner on Monday night to which we cordially invite all physicians wives and their friends But I shall not tell you all our secrets at the present time Please keep the dates with a big red line around them and come and register with "The Woman's Auxiliary to the Medical Society of the State of New York"

ANNOUNCEMENT

The Annual Banquet of the Medical Society of the State of New York will be held on Tuesday evening, May 10, at 7 P M in the Grand Ballroom of the Waldorf-Astoria, Park Ave and 49th St. Subscriptions will be $5 00 per person (including gratuities) Tickets to be collected at tables An excellent menu has already been arranged Outstanding speakers and distinguished guests will attend Fine music will also be provided including a fifteen-piece orchestra for dancing afterward As it is only possible to conveniently accommodate about eleven hundred, it is important for you to send your subscriptions early This will also facilitate the work of the committee in arranging for the seating for such a large number Will you, therefore, kindly plan now for the number of guests, with names, whom you expect to include in your party, or state preference of persons with whom you wish to be seated Cocktails will be served at the assigned tables in the Ballroom upon individual order, at any time after 6 45 P M

Please forward checks *promptly,* at $5 00 per cover payable to Dr Augustus Harris, 2 East 103 Street, New York City, Chairman Dinner Committee

Convention Exhibits will be illuminated
and open to display until 10 30 P M

To Dr Augustus Harris, 2 East 103 Street, New York City

Enclosed please find check to the amount of $ for covers for the Annual Banquet

My guests will be

I wish to be seated with

Signature

took him to Manaos, in the heart of the Brazil jungle, 1,000 miles up the Amazon He was away less than three weeks, most of his journey being by plane.

Although on a vacation, the surgeon was called into duty about twenty miles from Manaos when he found an Indian with a dislocated shoulder The shoulder had been dislocated a couple of days before and was reduced by Dr Cooper

"Medical conditions in the Amazon valley are very primitive," the doctor said "The people are frightfully jealous of their own national independence and an American can never get a license to practice medicine there."

About ten miles from Para, Dr Cooper visited a colony for leprosy victims and said there were about 1,500 in the camp "Nothing is being done to cure the victims," he remarked. "They are just left in the colonies to die" There are three colonies

Kings County

INDUSTRIAL MEDICINE AND ITS relation to the employe and employer were discussed on March 15 at a meeting of 150 members of the Medical Society of Kings County Speakers were Dr Cassius H Watson and Dr Marion B Sulzberger of Manhattan and Dr Clarence D Selby of Detroit.

THE ALUMNI ASSOCIATION OF THE Long Island College of Medicine will hold their Annual Alumni Day activities on April 30 The following program has been arranged

11 00 In Clinical Hall, Polhemus, "Gastro-intestinal Carcinoma" by Dr Albert F R. Andresen, '07

12 45 Annual Luncheon in the Hospital

1 30 "The Evolutionary Perspective of Syphilis" by Captain Richmond C. Holcomb, M.C., U S N., '96

2 30 Annual Business Meeting

7 00 Annual Dinner of the Association, Columbus Club, Prospect Park West and Union Street. Speaker of the evening, Honorable Frank Hague, Mayor of Jersey City

THE SOUTH BROOKLYN MEDICAL SOCIETY returned to the attack on the WPA methods of treating the sick in public clinics in a report issued on March 12 While hordes of needy sufferers here submit to the ravages of disease rather than face personal treatment in open clinics, the borough physicians protested, they themselves are being squeezed out of practice by the same sort of "unfair competitive tactics" which stirred the wrath of the business world They urge that the authorities abandon the mass treatment scheme by returning the impoverished patients to their family physicians who have intimate knowledge of case histories

Dr John J Jennings, press reference committee chairman of the Kings County Medical Society, admitted to an interviewer that these contentions reflect the attitude of "a fair proportion of all the doctors in Brooklyn."

Personnel of the Works Progress Administration set-up, the medical society spokesman declared, consists in the main of doctors "who have been unable to meet the competition of their fellow medical men and are willing to accept a weekly salary of $29 50 a week"

"The family physician's office is open twenty-four hours a day," states the report. "These medical men represent the best the public may have in medical care.

"Our government instead insists on immediately flip-flopping into its own set-up, spends large sums for buildings, puts a few doctors in charge, a clerical force is created, and then gets to work in an effort to save lives and bring sound health to the needy All this disregards the trained medical practitioner who, without the aid of social service investigators, has intimate knowledge of the families he treats"

The report is the result of a survey by a committee of three, Dr Sylvester McNamara, Dr John J Sheehy and Dr Pasquale J Imperato, prepared in answer to a report issued by the Public Health Service in Washington, which cited "the need and occasion for development of a national health program"

Of the public syphilis clinics the report remarks

"It does not dawn upon the authorities that these thousands of young men and women suffering from social disease feel too ashamed to congregate with others, sitting in line as they wait for their Wasserman tests to be taken, or to be treated for syphilis, knowing that all the others in the room are victims of the same disease, living in the same community They fear these others may gossip and spread their shame about the community"

The Government, according to the report does not take advantage of thousands of private offices where people thus afflicted may go for treatment in privacy Unless conditions are changed, it predicted, there will be a heavy increase in the number of social disease cases resorting to self-medication and quackery

Madison County

DR. OTTO PFAFF, dean of Madison County physicians, and prominently known throughout the state in medical and polit-

Medical News

Albany County

WILLIAM F RIENHOF, MD, FACS, Associate Professor of Surgery at the Johns Hopkins Medical School, addressed the Medical Society of the County of Albany on March 23 on "Carcinoma of the Lung and Allied Conditions"

Bronx County

THE BRONX COUNTY Medical Society, at its meeting on March 16, listened to the following program on Medical Assistance to the Indigent

"Medical Care at the Crossroads," by Dr E C Woods, Chairman, Public Relations Committee, Westchester Medical Society Discussion was by Dr Augustus Hambrook, Chairman, Public Relations Committee, State Medical Society, Dr Jackson Davis, Medical Officer, State Department Social Welfare, and Dr J B Schwedel

Chautauqua County

THE SPRING MEETING of the Chautauqua County Medical Society was held at Dunkirk on March 16, nearly fifty physicians and surgeons from all parts of the county attending the conference at Hotel Francis

Dinner was served and a scientific session and business meeting followed Dr Clive E Hallenbeck presided.

Dr D K. Kitchen of Detroit, Mich, the principal speaker, told of recent advances in the use of endrocrine products in therapeutics of glands of internal secretion A motion picture showing the technic of spinal anesthesia was shown and a general discussion followed

Standing orders for public health nurses, suggested by the State Medical Society, were discussed and adopted

Chemung County

DR. ADOLPH ROSTENBERG, JR, addressed the Chemung County Medical Society on March 17 on allergy and its relation to dermatology, with lantern slides On March 24 Dr Anthony Cipollaro spoke on cutaneous tuberculosis

Cortland County

THE CORTLAND COUNTY MEDICAL SOCIETY met on March 18 at Hotel Cortland. Dr I H Levy presented a paper on "Lesions of Opening of the Stomach, Benign and Malignant." Dr J E Wattenburg and Dr C J Kelley led the discussion

Erie County

RECENT COMPLAINTS OF private physicians concerning alleged abuses of the facilities of the State Institute for the Study of Malignant Diseases are unjustified, The Committee on Economics of the Medical Society of the County of Erie decided on March 7, following a forum meeting in the society's offices

Dr Burton T Simpson, head of the institute, informed the physicians that under present rules no case is admitted to the institute without a letter from a doctor, that cases needing surgery are referred back to family physicians, that no cases are admitted where cancer is not suspected, that more than nine-tenths of the patients are unable to pay for treatment, and that no hopeless cases are accepted.

Dr L Franklin Anderson, Chairman of the committee on economics, presided.

Fulton County

DR WILLIAM T DORAN, of Bellevue Hospital, New York, delivered an interesting paper on "Intra-abdominal Conditions Due to Trauma," at the meeting of the Medical Society of Fulton County, Gloversville, on March 18 The paper was of interest to all, particularly since it was presented in such a practical manner A number of clinical examples with x-ray findings were cited by the doctor He also showed a number of photographs of several cases of unusual rarity that he had had opportunity to see

Following the paper, Dr W J Kennedy, Urologist at Nathan Littauer Hospital, gave a brief discussion of pathological conditions of the kidney and bladder also due to trauma.

The officers of the Society for 1938 are as follows *President,* H H Oaksford, *Vice-president,* J A Shannon, *Secretary,* Louis Tremante, *Treasurer,* J D Vedder, *Board of Censors,* Woodard Shaw, W J Kennedy and S J Colton, *Delegate to State Society,* S C Clemans, *Alternate,* Claude Bledsoe.—Reported by Louis Tremante, *Secretary*

Jefferson County

DR. HOWARD N COOPER returned home on March 18 after a 12,000 mile trip that

Onondaga County

PHYSICIANS MINGLED WITH engineers at the meeting of the Technology club on the roofgarden of the Onondaga on March 14, when a symposium on "Public Health" was presented under auspices of Syracuse section, American Society of Civil Engineers, in conjunction with the Onondaga County Medical society

Dr O W H Mitchell, president of the medical society and professor of public health in College of Medicine, Syracuse university, presided over the discussion Earl F O'Brien is president of the ASCE

Dr Phillip J Raffle, district state health officer, opened the symposium by outlining the work of his department. Dr H Burton Doust, city health commissioner, discussed the operation of his department, recognized as one of the highest standing in the country The third speaker was Anselo F Dappert, principal sanitary engineer of the state division of sanitation

A SPEAKER FROM THE Syracuse Chamber of Commerce public health committee will discuss "Auto Accidents as Related to Health" at a meeting of Syracuse Academy of Medicine, April 19 Announcement of the talk was made by Dr D F Gillette, chairman of the chamber's special committee on health factors in traffic accidents

The group met on March 17 in a further study of how much physical defects contribute to accidents Continued study was recommended since the committee has found official records do not give details on the physical status of drivers involved in mishaps

DR. MARY R. LAKEMAN of Rochester State commander of the Women's Field Army for the Control of Cancer, told fifty upstate women in an Army campaign meeting in the Mizpah Auditorium Syracuse, on March 11, that cancer, now the nation's second greatest cause of death, would be under full control within a generation

The former executive of the Massachusetts State Health Department spoke as leaders of the Army from seven counties mapped plans to raise $2,600 in Syracuse and more than $100,000 in the State during April, to carry on an educational campaign for cancer control The money will be raised by subscription

Clubwomen from the Army's fifth district, including Onondaga, Oswego Oneida, Lewis Jefferson, Madison and Herkimer Counties, attended the session and heard addresses by Dr George Price, chairman of the cancer committee of the Onondaga Medical Society, Dr Nathan P Sears, Dr Donald S Childs and Mrs Alexander S Oberlander, president of the Syracuse Federation of Women's Clubs

Oswego County

DISAGREEMENT BETWEEN MEMBERS of the Oswego Academy of Medicine, serving as members of the surgical and medical staff of Oswego Hospital and the city of Oswego, relative to fees charged for care of welfare patients, sent to the Oswego Hospital for hospitalization, prevailing for the past eighteen months, are on the way to a settlement satisfactory to all concerned, according to accounts in the Oswego newspapers

Mayor Willard J Hall, for the Hospital, over a period of several months, had been negotiating with a committee representing the Academy of Medicine, consisting of Dr J F Burden, Dr J T Dwyer and Dr C Kenneth Elder, and a final meeting was held at the Mayor's office, City Hall, on March 15, when terms of an agreement on fees were worked out satisfactorily

The Hospital will continue to receive $4 per patient day, as it has in the past eighteen months, since the physicians attending welfare patients resigned as members of the Hospital staff Oswego Hospital has had no official staff since the wholesale resignation, but, at the present time, since the resignation a staff has been functioning, under administration of the Academy of Medicine, members of which rotated services in the operating room and wards, on a three months' service basis, much as had been done previously under Hospital direction of the staff

There was no indication, said the Mayor, who also is president of Oswego Hospital, that this system would be changed immediately, and the Hospital organize a new medical and surgical staff

The agreement will somewhat reduce costs to the city for operations on, and care of welfare patients A schedule of fees for operations will be set up, on an equitable basis and it was expected later the Academy of Medicine would ratify the proposition to be adopted by the Welfare Department.

Queens County

AN INTERESTING PAPER BY Frank H Lahey, M D, on gastric and duodenal ulcer, was presented at the meeting of the Medical Society of the County of Queens on March 29, and a paper on diphtheria mortality was presented by Samuel Frant, M D

A JOINT MEETING OF THE Medical Society of the County of Queens and the pharmaceu-

ical circles, was publicly acclaimed Oneida's No 1 citizen for civic leadership and humanitarian work on March 10 as 250 county and municipal leaders and personal friends jammed the Elks Temple in Oneida for the testimonial banquet

The dinner was in commemoration of the fiftieth anniversary of Dr Pfaff's graduation from the New York College of Medicine He began his practice at Turin, Lewis County

Six speakers, including William F Santry, former City Judge, who acted as toastmaster, lauded Dr Pfaff for his work to fellowmen Many congratulatory letters and telegrams from Governor Lehman, Postmaster General Farley, and other national and state leaders, were read

Monroe County

THE MEDICAL SOCIETY OF THE County of Monroe announced on March 16 a program to prevent deaths from childbirth of 100 more babies and 10 more mothers a year in city and county

The announcement followed on the heels of a report that the county has a maternal death rate below the national average

Dr Charles A Gordon, chairman of the State Medical Society's committee on maternal welfare, commended the county maternal welfare committee for this record

Based on a five-year study by county committee members, the new program is designed to secure cooperation of the parents to

1 Use nursing services more

2 Pay more attention to eugenics and less to birth control

3 Realize the responsibility of "pa"ternity as well as "ma"ternity

Local and state health departments, hospitals and dispensaries, the Public Health Nursing Association and the Tuberculosis and Health Association will cooperate in this educational effort Special attention will be given to an attempt to reduce the infections due to blood poisoning and to increase clinic facilities in rural areas

New York County

NEW DEATH CERTIFICATE FORMS on which physicians will be required to make confidential reports in detail on the causes of patients' deaths, are being prepared for use in New York City

Dr John L Rice, Health Commissioner said the forms will be tried out first in Manhattan and the Bronx, but will be instituted shortly in Queens

They were drawn up, Dr Rice said with the aid of the Queens County Medical Society and other county medical groups, and are expected to lead to more frank reports on deaths

The present forms, it was pointed out, have a place on the front for such information, and doctors often hesitated to tell all the truth about what caused a patient's death The new forms, however, have a separate section devoted entirely to causes of death

This section is to be kept strictly confidential, Dr Rice said, and may not even be used in court cases

PRESIDENT NICHOLAS MURRAY BUTLER of Columbia University will speak at the New York Academy of Medicine on April 28 at 8 15 on "Medicine and the Progress of Civilization"

DR CHARLES M MCDOWELL AND DR ORLANDO S RITCH, both graduated from New York Medical College, then called New York Homeopathic Medical College, in 1878, received gold medals on March 9 at a luncheon at the college, York Avenue and Sixty-fourth Street. The medals were inscribed "In recognition of sixty years of faithful service to our alma mater and to humanity" Dr McDowell is professor emeritus of physiology, and Dr Ritch is a trustee

DR EMANUEL LIBMAN, diagnostician and contemporary of the late Dr Harlow Brooks, will read the Harlow Brooks memorial lecture at the meeting of the Washington Square Medical Society on April 28

CONTROL OF SYPHILIS was the topic at the meeting of the Medical Society of the County of New York on March 28 The speakers were Drs David J Kaliski, Thomas Parran, Jr, Surgeon General, George Miller MacKee, and Howard Fox

Niagara County

THE REGULAR MEETING of the Medical Society of the County of Niagara was held March 8 at the Hotel Niagara, Niagara Falls Dr Vincent D Leone, President, presided As chairman of the Subcommittee on Pneumonia and Syphilis Control, Dr E E Gillick spoke regarding "The Control of Syphilis" It was decided that a list of speakers should be prepared to be made available to the public for the syphilis campaign

Dr Burton G Simpson of the State Institute for the Study of Malignant Disease at Buffalo spoke on "The Recent Advances in the Etiology of Cancer"

Reported by Forrest W Barry, M D
Secretary

Hospital News

Dale Carnegie Tells How to Raise Hospital Funds

NO LESS AN EXPERT THAN Dale Carnegie, who wrote "How to Make Friends and Influence People," was Chairman of the Speakers Bureau in the recent United Hospital Fund Drive which scored a smashing victory in New York City He wrote a small four-page folder to help the money-raisers extract the needful from the kind contributors who after all were really the ones who made the campaign a big success It is well worth preserving by hospital officials who may sometime be planning a drive. Here it is, entitled, "How to Win Prospects "

The eight ways to help win people to your way of thinking which I outlined in my book, are the same eight ways to help win gifts for the support of the essential health services protecting the people of New York.

Briefly repeated, these are as follows

1 The only way to get the best of an argument is to avoid it.

2. Show respect for the other person's opinion. Never tell a man he is wrong

3 If you are wrong, admit it quickly and emphatically

4 Begin in a friendly way

5 Get the other person saying "yes-yes" immediately

6 Let the other man do most of the talking

7 Try *honestly to see things from the other* person's point of view

8. Let the other man feel that the idea is his, not yours

As far as gift solicitation goes, these eight general methods of dealing with people may be narrowed down to five specific goals you will be shooting at. The goals will have to be reached one after the other, so I have attempted to list them below

First—Know the facts You know what the hospitals are and what they do You know how they protect the community's health You know the broader program of health protection which is being undertaken through integration of medical social service, convalescent care and home care with the active hospital treatment of the sick. You have made yourself familiar with this information at meetings and by reading the campaign literature. Aren't these facts, which convinced you, the same as will convince your prospect? So, Step One is KNOW YOUR FACTS

Second—Be interested in your prospect You have studied his record to find out how much he should give. This interest in him will, in turn, help interest him in you and your appeal Besides, it is what makes possible getting an early yardstick gift from your best prospect as a challenge to those you see later on. So, Step Two is STUDY YOUR PROSPECTS

Third—Remember the value of time You cannot afford to take a chance on your prospect not being able to see you So you make an appointment. Will not this make him realize the importance of your call? It will also ensure you an opportunity for personal solicitation. Let's call Step Three MAKE AN APPOINTMENT

Fourth—Know what is needed You realize how much the hospitals dig into their own pockets for free care. You know that the 3-cents-a-day plan does not provide funds to meet these extra needs You understand then why they need support. In the same way you can make your prospect realize why the hospitals need his gift and the gifts of the other executives of his company Why they also need a corporate gift equal to $4 for each of the company's employees. Step Four, then is GET BOTH EXECUTIVE AND CORPORATE GIFTS

Fifth—Have full confidence There is no question in your mind about the need of the voluntary hospitals Knowing their value, you have no doubt that the money will be raised

My work in life has been to teach people the confidence they need for success When they have that the battle is nine-tenths won.

You already have this confidence. That makes me, for one, sure of the campaign's success Sure that New York will have the continued protection of its voluntary hospitals So Step Five is LET'S START NOW, AND SEE OUR FIRST, AND BEST, PROSPECT TODAY

Rapid Wall-Washing Device

LABOR HAS BEEN CUT IN HALF, the soap used has been cut ninety per cent, and, best of all, the walls are kept clean as never before, by a simple wall-washing contrivance in use at Evanston Hospital, in a suburb of Chicago It cleans all types of walls, corridors, paneling, washable wall paper, and delicate pastel colors, says Mrs Blanche W Watt in *The Modern Hospital*, and she describes it as follows

tical associations of the county was held at the society's building on April 6

Dr. Adolph George DeSanctis of Manhattan addressed the Rockaway Medical Society on March 10 at the monthly meeting in the Inwood Country Club Dr Louis A Sarrow, the president, presided. Preceding the meeting a dinner in honor of the speaker was held

The open meeting of the Queensboro Surgical Society will be held in the Auditorium of the Medical Society Building on April 28, at 9 P M John E Jennings, M D, F A C S will be the guest speaker

The meeting will be preceded by the Annual Dinner

Rensselaer County

The Community Chest drive was outlined to the Rensselaer County Medical Society at its meeting on March 8, in the Troy Health Center by Louis A Serene, secretary of the Troy Council of Social Agencies

Other items on the agenda included a medical paper, "Posterior Presentations" by Dr John F Connor Discussion on the paper was led by Dr J H F Coughlin, Dr William B D VanAuken, Dr Charles R Lewis and Dr Douglas A Calhoun

The meeting also heard a report from the society's compensation and arbitration committee

Steuben County

With the program dealing chiefly with gynecological technic, the Steuben County Medical Society met in Corning on March 10 for its spring session About thirty-five physicians attended

Following luncheon the business meeting and program was presented in the Corning Club

Mrs Herbert L Beecher of Livonia, district manager for the Women's Field Army for Cancer Prevention described the women's campaign against cancer

The principal talk was given by Dr Chester S Clark of the department of gynecology, Syracuse University, on "Misplacements of the Uterus"

Sullivan County

The Medical Society of the County of Sullivan arranged a course of nine lectures for its members, to be given each Wednesday night beginning March 9 and continuing until May 4 The courses on Dermatology and Syphilology as given for the most part to postgraduate students at Columbia University, are being brought directly to Sullivan County

Four of the lectures are scheduled for Monticello, four for Liberty, one at Loomis and one at the Woodbourne Institute for Mental Delinquents at Woodbourne.

Officers of the County Medical Society are Dr Harry Golembe, *president*, Dr Ralph S Breakey, *vice-president*, and Dr Deming S Payne, *secretary-treasurer*

Warren County

Dr. Norman Jolliffe of the Department of Medicine at New York University and Bellevue Hospital Medical College was guest speaker at a meeting of the Glens Falls Academy of Medicine on March 18 at the Crandall Library He discussed "Clinical Aspects of Vitamin B-1 Deficiency" Much of Dr Jolliffe's work on B-1 has been done in chronic alcoholism centering about a study of the effect of the vitamin on peripheral polyneuritis in this condition.

Westchester County

The Westchester County Medical Society forwarded a recommendation to the State Medical Society on March 15, that in view of the success of the Associated Hospital Service Plan and of the current promotion of other private insurance plans, "it is more than ever desirable that the State Medical Society prosecute with all possible speed its plan for the eventual establishment of a program of voluntary non-profit medical expense insurance for persons in the lower-income groups, and operated under the four basic principles which have been stated and adopted by this society"

The four basic principles referred to were incorporated in a statement adopted by the Westchester County Society in January It was then declared that organized medicine should favor any program to make medical care more available than at present by improved economic arrangements, that lay agencies should confine their functions to the non-medical aspects of any plan for such purpose, that the medical aspects of such a plan should be absolutely and solely in the hands of the medical profession, and that these two functions should be kept clearly inviolate and the status of the medical profession firmly established by suitable legislation.

Although the Westchester County Medical Society has thus endorsed the principle of voluntary non-profit insurance against medical expenses, a spokesman said that the society is more than ever opposed to compulsory health insurance under governmental auspices

affiliation with organized medicine to secure appointment. Some sixty eligible physicians in Erie County, authorized to care for workmen's compensation cases through recommendation by the County Medical Society, are non members of the Society The Membership Committee has instituted a campaign to impress eligible non-members with the fact that their isolation weakens their professional and public relationships The Committee is composed of Dr Allen R. Long, Chairman, and Drs Marvin Block, J G Fowler, J G Kanski, K. P Lyons, and H O Muscato

A SYSTEM UNDER WHICH all physicians would be members of a hospital staff, was urged by Dr Walter S Goodale, superintendent of Buffalo City Hospital, at a meeting of the Lions Club of Buffalo on March 21

The plan would have two motives, Dr Goodale explained. First, to enable the physician to gain a greater knowledge of medicine, and second, to enable physicians practicing in poorer neighborhoods of the city, who lack proper equipment to combat a certain disease, to take their patients to the hospital where necessary treatment could be obtained

The speaker also advocated reimbursement of physicians who donate their services in private institutions to public charges At present, he explained, these physicians are members of the hospital staff, donating their services to conform with an honorary custom that long has been in vogue

•

AMBULANCE DRIVERS EMPLOYED by private hospitals have addressed an appeal to Mayor LaGuardia and Commissioner Goldwater of the Department of Hospitals for amelioration of working conditions which they describe as among the poorest in the city

The plea was directed at the city officials because most hospitals have contracts with the city by which each receives $9,500 for the upkeep of two ambulances

Spokesmen for 162 drivers, who are organized in the Ambulance Drivers' Union, Local 643, International Brotherhood of Teamsters, said that unless promises of improved conditions are received the union would consider a strike vote

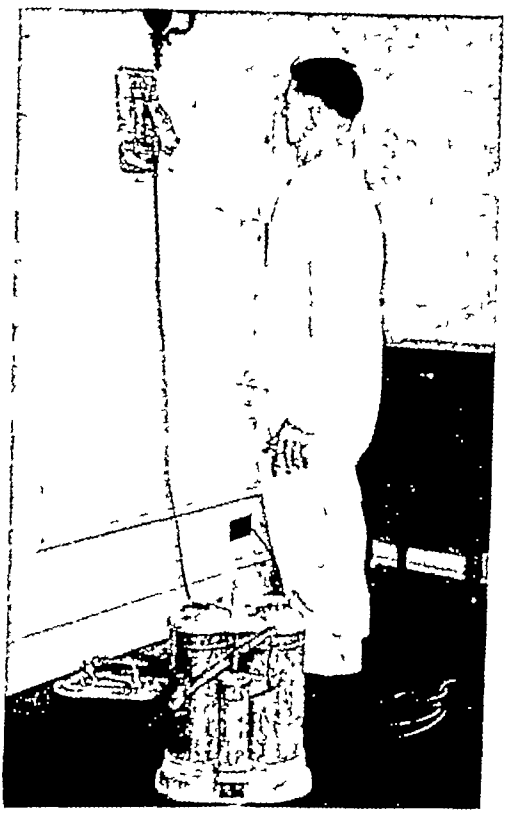
Louis J Orifice, one of the delegation, declared the average pay of drivers is $70 a month, and that some receive less than $60 The average working hours, he said, are eighty-four a week, with twenty-four and thirty-six hour shifts common in many hospitals Provisions for food and lodging for the drivers, he said, are not adequate

RESUMING ITS ORIGINAL custom of holding its Spring ball immediately after Easter, the Woman's Auxiliary of the Nyack Hospital has set April 23 as the date for the ball this year The ball will be held in the auditorium of the Rockland State Hospital, Orangeburg

THE ALUMNI ASSOCIATION of the Kings County Hospital, Brooklyn, announces Alumni Day, May 14 Ex-interns from all over the country are expected Clinics will be held all day at the hospital Annual Dinner, with election of officers, will be at a New York hotel Inquiries addressed to (Miss) Elizabeth Sigeti, Kings County Hospital, will receive immediate attention

MEMBERS OF THE Rockland County Medical Society and 500 employees of the Rockland State Hospital gave votes of confidence to Dr Russell E Blaisdell, superintendent of the State Hospital, on March 14, at their respective meetings Strongly-worded resolutions were adopted in both cases

The Medical Society voted to send its resolution to Governor Lehman and other State officials and the hospital employees delegated a committee of four to go to Albany to add weight to their resolution of confidence in Dr Blaisdell



Charges have originated from sources and from motives which "in the opinion of fair-minded men would not be considered fair and impartial," states the Medical Society resolution, going on to declare that the members in their familiarity with Dr Blaisdell and the hospital methods have seen only the highest professional standards

The employees say in their resolutions

We feel that a grave injustice has been committed against the good name and fair reputation of the institution by the malicious and erroneous statements of a few disgruntled former employes, which have been sensationally published in a New York newspaper

Any employes such as those who made ill-founded accusations, who have been discharged or whose resignations have been requested

The machine consists of two tanks, each holding six quarts One is used for the soap solution and the other for the rinse water Fastened to each tank is a tube of rubber thirty-five feet long A six by twelve-inch trowel is attached to each tube and a gauge and valve are used to regulate the supply of solutions to the trowel Covering the trowel is turkish toweling of double thickness, folded and sewed so that no raw edges are visible. These cloths are easily clamped on and are equally easy to remove, so they may be kept clean at all times The machine is durable, light and easy to move.

When the operator reports for work he brings everything needed for the day, including from thirty to thirty-five trowel covers This is our daily average Before mixing the soap solution the condition of the wall is noted to determine the strength of the solution necessary For surfaces washed once a month to once every six months, we use 1½ to 2 ounces of any good neutral soap to one gallon of water

Before beginning work both tanks are filled, forty pounds of air pumped into each tank, the trowels attached and the gauges and valves adjusted. Less than fifteen minutes is needed for preparation In order to keep a sufficient amount of pressure to force the solutions through the tanks to the trowels, air is pumped into the tanks three or four times during the day Solutions in both tanks are checked frequently to make sure they are clean.

Inexpensive trowel cloths are purchased in dozen lots They stand up well under service and are sent to our laundry daily As compared with wall washing sponges we find that turkish toweling costs less, lasts longer and is easily kept clean

Machine Is Easy to Operate

The knack of handling the equipment may be quickly learned by the intelligent worker We were fortunate, however, in having among our employees a man who had previously had demonstration experience with the machine. This experienced and competent workman can cover from three to five rooms, twelve by sixteen feet, with one or two windows in eight hours In our opinion the ordinarily capable worker could gain enough experience in a few weeks to approximate this speed With our trained man there is no streaking or lap marking and no drop cloths are needed in corridors and public rooms Undoubtedly, a less experienced man would be unable to do the work so neatly at first, but this skill can be acquired.

We have found that this method of washing does not wear the paint surface as much as does ordinary washing by hand, and it has reduced our schedule of repainting at least one-half

The only hand washing we find necessary to do is where the flat, straight-edged trowel interferes with convex or curved corners or where there are many pipes and obstructions in walls and ceilings This type of trowel would likewise not be practical on highly stippled walls

Newsy Notes

THE STAFF OF Millard Fillmore Hospital, Buffalo, of which Dr James H Borrell is President, has adopted and enforced a rule that all staff members shall be members of the County Medical Society This provision is in line with the new By-Laws of the Buffalo Hospital of the Sisters of Charity which requires that staff members shall affiliate with the Medical Society or the Dental Society The Staff of Deaconess Hospital reports ninety-nine per cent membership in the County Society, and other hospitals are considering this requirement—a policy recommended by the American Medical Association Insurance companies and some governmental agencies require

Medicolegal

LORENZ J BROSNAN, ESQ
Counsel, Medical Society of the State of New York

Libel and Slander—Authorship of Article in Medical Magazine

In a case which came to trial a short time ago in one of the courts of the City of New York, interesting questions were raised concerning the publication of scientific articles in a medical journal*

The plaintiff in the action was a duly licensed physician practicing his profession in the State of New York, who brought suit against the defendant publishing company, the owner of a magazine devoted to medical matters The plaintiff sought damages by reason of an article which had appeared in an issue of the magazine entitled "Therapeutic Uses of Collodial Sulphur", which plaintiff claimed was falsely attributed to him Prior to the trial of the action a certain Dr C was brought in as a party defendant in the case.

The case was tried by the Court without a jury and it appeared that the plaintiff was professionally associated with a number of hospitals and that he also was a teacher of internal medicine. He had written a number of articles which had appeared in various medical journals Dr A testified that the article in question had been published in the defendant's magazine under his name but that he did not write or have anything to do with the said article. He claimed that as a result of its publication references to it had been made by friends and professional acquaintances, with the result that he had been held up to ridicule and contempt in his profession

Dr C, called as a witness in the case, gave testimony that he had been the person who had prepared the article referred to and that the plaintiff had had no part in its preparation Dr C. further stated that he had at a previous time asked the plaintiff Dr A, to prepare an article on the subject of collodial sulphur, but that he had refused to do so giving as a reason that the time was not ripe for a definite statement concerning its uses Dr C testified that he was interested in a chemical company, which was sponsoring such a product and that in due time he expected to be appointed to a salaried position with said company and admitted that he had a definite interest in advertising the product and that he had read the galley proofs of the article in question before its publication

The published paper submitted to the Court upon the trial, included among other things a number of case histories cited by the author One such account was to the effect that a certain patient fifty-four years of age, who had been walking with a cane for some time, after four injections of collodial sulphur was "able to dance all night" Another such instance cited in the article was of a patient who, aged sixty-four, suffering from acute sciatica, after twenty-five treatments had been able to "push a baby carriage two miles" A third instance cited in the article was of a man twenty-four years of age, who had suffered from a carbuncle for a few days and had been unable to work, who had returned "to strenuous labor six days after his first injection"

The Court concluded that the plaintiff's cause of action was well founded and granted judgment in favor of the plaintiff, both against the defendant publishing company and against Dr C.

In so deciding, the Court handed down an opinion in the course of which he stated

> The plaintiff did not believe that the product was ready for general application, consequently, he objected to having his name associated with such advertising, and considered the publication contrary to professional ethics The article was falsely attributed to the plaintiff, and it seems to me its advertising characteristics would hold him up to severe criticism in his profession.
>
> The question arises Is the illegal and unauthorized use of plaintiff's name to such an article libelous *per se?*
>
> It follows, therefore, that the article published by the defendant is libelous *per se*, and that no special damages need be alleged or proved
>
> This is not a case wherein exemplary damages may be awarded, and we must concern ourselves with the question of nominal or compensatory damages
>
> It would not be fair to infer in the case under consideration that the plaintiff "had no character to lose." On the contrary, the plaintiff made an impressive witness, appeared to be sincere in the practice of his profession and imbued with the proper respect for medical ethics
>
> Therefore it seems to me he is entitled to compensatory damages, basing same on the

*A v B Publishing Co, 166 Misc. 39

have fully merited their dismissal from service in the institution.

The food is wholesome and sufficient in quantity Working and living conditions of the employes, as well as the living conditions and the treatment of patients, compare favorably with those of any institution in New York State

Improvements

THE BILL OF Senator James J Crawford and Assemblyman Crawford W Hawkins, both of Brooklyn, authorizing the trustees of the Long Island College Hospital to finance a building expansion program was added to the statute books on March 15 Governor Lehman announced his approval of the measure

Hospital authorities, it is understood, plan to construct a large addition to the hospital and college, to be financed by a mortgage operation The measure authorizes the board of regents of the hospital to sell, mortgage or lease any real property in its possession

THE NEW $225,000 FIVE-STORY wing of the Buffalo General Hospital is now completely open for use, Dr Fraser D Mooney, superintendent, announces

The principal addition afforded the hospital is a suite of six new operating rooms, each with a balcony from which medical students may view operations

The rooms are artificially lighted, air-conditioned and sound-proofed. Illumination is such that no shadows are created.

The surgery ward occupies the fourth floor On the fifth floor are accommodations for interns The first floor is given over to a staff dining room, library, examining room, and a waiting room.

CONSTRUCTION OF THE $450,000 addition to the State Institute for the Study of Malignant Diseases in Buffalo, at High and Oak streets will be begun this spring The new six-story hospital will house facilities to care for 104 cancer patients, in addition to clinical facilities

THE NEW 400-BED HOSPITAL at the National Veterans Home in Elmira is now in full use, although dedication is not scheduled until May 15

A NEW BRIDGE AT Ellis Hospital in Schenectady connects the E wing to an adjacent building with over forty rooms, large, airy and sunny, renovated and refurnished for additional patients A large new wing is also now under construction

A NEW WING FOR THE Greenwich Municipal Hospital is recommended by Dr Thomas J Bergin, health officer

At the Helm

THESE HOSPITAL OFFICIALS HAVE BEEN CHOSEN

Herman Ringe, to be President of the Wyckoff Heights Hospital, reelected

Nathan S Jonas, to be President of the Jewish Hospital of Brooklyn, reelected

Mrs Henry P Molloy, to be President of the Woman's Auxiliary of the Victory Memorial Hospital of Brooklyn

Herbert Caldwell, M D , to be chief medical officer of the U S Veterans Facility at Batavia

Hugh D Marshall, to be President of the Greenwich Hospital Association

Dr J J Golub, Executive Director of the Hospital for Joint Diseases of New York, appointed to the Saratoga Springs Authority

DR EDWIN HOWE FISKE confirms a report that he resigned several weeks ago as director of surgery of Kings County Hospital Dr Fiske said he understood that he would continue in the position for another year so that he could retire on a pension but that he would hereafter take no active part in the affairs of the hospital Dr Fiske has been connected with the hospital thirty-six years

He was retiring, Dr Fiske said, to devote more time to writing, to give younger men "a chance" and to be able to give more time to other work, including that at the Holy Family Hospital, Brooklyn, where he is a staff surgeon

He pointed out that the Holy Family Hospital hoped to open its new building soon Long efforts by Dr Fiske culminated in the erection of the present main building of Kings County Hospital

Across the Desk

A Corking Book of Medical Reminiscences

Up in the northern part of New York State, only half a mile from the Canadian border, lives a fine old physician of seventy-six summers who can, "when necessity arises, still operate as of yore, with a steady hand and a stout heart, on a formidable case." He is still practising, "not from financial necessity, but because I love to, with a help-meet loving and lovable, the girl whom I chose as my head-nurse in Bellevue, with children of whom I am proud, with enough grandchildren to make me feel something of a patriarch."

He is Dr William N Macartney, of Fort Covington, and he has written a corking book of reminiscences entitled "Fifty Years a Country Doctor* His little community is made up of Indians on a reservation, French Canadian habitants, farmers, and small-town folks, which guarantees what the newspaper fellows call "local color" and 'human interest stuff" As one reviewer says, "his characters out-Harum David Harum"

"Get Out of My Way!"

If you want a glimpse of the man, take the time he patched up the broken skull of an Indian whose squaw had nearly brained him with an axe Next day when he called he found a youngish man on the front steps who asked

"Is this man going to die?"

"I can tell better when I look at him," replied Macartney

"Was his skull fractured?"

"Yes"

'Did you take some of the bone out?"

"Yes"

"Where is it?"

"In a good safe place"

"You are not very communicative I can make you talk," he said, getting red in the face.

"You're not man enough, you damned whipper-snapper"

"I want you to understand that I am the District Attorney of Franklin County," said he.

"You may be the Great Mogul of Hell for all I know, but if you don't get out of my way and let me see my patient, I'll knock your block off"

The doctor saw his patient

Many of the reminiscences are stories of the Indians and French-Canadians along the border For instance, he recalls the mourning of Antoine Larouche at his wife's funeral A friend met him and said

"Antoine, I was very sorry for you I see at the funeral how bad you was feel for lose your woman"

Antoine inquired, "Did you see me at de church or at de cemetery?' '

"At de church, Antoine."

"Mon Dieu! You should have seen me at de cemetery! I jus' raise Hell at de cemetery!"

Then there was the old Yankee farmer living on "Sand Street," an out-of-the way place. One sleety winter day he had a heart attack, and the doctor came on the run, only to find he had left his stethoscope behind He began to open the man's shirt in front, met another, and, seeing a third, asked, "How many shirts are you wearing, Abner, six?"

"No," said he, "I ain't got only four on"

Finally Dr Macartney got his ear down to Abner's chest, when his wife appeared from the "buttery," saying, "Abner, why don't you take off some of them shirts so the doctor can hear what's agoin' on in your insides?"

Abner grinned "Oh, all the doctor's tryin' to do is warm his ear"

Pneumonia Not a Disease?

But it would be a mistake to think that this fine old country doctor had merely compiled a volume of funny stories Far from it A large part of his book is devoted to his treatment of the diseases encountered in his half-century of practice. Beginning with his chapter on "Diet," on page 187, this summation of a lifetime of experience

Fifty Years a Country Doctor, by William N Macartney, M D, 584 pages, New York, E P Dutton & Co., 1938.

nature of the libel, the social and professional position of the plaintiff and the tendency to injure the plaintiff in the public estimation of his character

In so deciding the Court referred to an earlier case decided by the Court of Appeals * In that case the law of libel applicable in the case presented was summarized by Chief Judge Crane of the Court of Appeals as follows

In order to constitute a libel, it is not necessary for the defendant in its paper to directly attack the plaintiff as an ignorant imposter The same result is accomplished by putting in her mouth or attaching to her pen words which make self-revelation of such a fact One may say of a physician that he is an ignorant quack, or he may print a statement by the physician regarding some operation performed by him or some treatment of a disease which shows him to the profession to be an ignoramus and a bungler Both of these publications would be libelous This publication regarding the plaintiff is an attack upon her profession and livelihood, and is libelous without plea or allegation of special damage.

Suppose the defendant had published of the President or of the Governor of this State an article purporting to have been written by him, in which his views therein expressed were false and contrary to his avowed principles theretofore made known to the public, and further, that it contained statements of fact regarding public finances or prohibition or the tariff, which were grossly inaccurate and absurd and ridiculous in the eyes of those acquainted with governmental matters Would not such an article be libelous?

The law of libel is very simple, and, briefly, is this "Whatever words have a tendency to hurt, or are calculated to prejudice a man who seeks his livelihood by any trade or business, are actionable. When proved to have been spoken in relation thereto, the action is supported, and unless the defendant shows a lawful excuse, the plaintiff is entitled to recover without allegation or proof of special damage, because both the falsity of the words and resulting damage are presumed."

Claim of Improper X-Ray Treatment

A young married woman consulted a physician specializing in obstetrics and women's diseases, and gave a history of having had her appendix removed some years before, having for two years been troubled with excessive menstrual flow and of having undergone a curettage the previous year, since which time the patient claimed she had been in a generally run-down condition

She also complained for the past month she had been flowing excessively with clots at times, and that another physician had ordered a curettage She complained of pain and soreness in the back and legs and pressure on the rectum

The doctor examined the patient and diagnosed a fibroid the size of a small orange in the fundus, the rest of the uterus appearing boggy, cervix dilated about three fingers The doctor considered the possibility of an aborted uterus or a malignant uterus The uterus itself was retroverted The doctor explained to the patient that she probably was suffering from a fibroid tumor, and advised x-ray treatments to stop the flow, and a period of observation to determine whether further x ray treatments or other treatments were necessary A single x-ray treatment was administered to her When a week later she returned for observation, the patient complained of being sick, which she attributed to the use of the x-ray She admitted that her flowing had stopped. The next heard from the patient was some days later when the doctor was called to attend her at home The patient was in bed and having an exaggerated menstrual flow The doctor reassured her that the condition was not unusual Following that, another physician saw the patient and after a conference the patient was admitted to the hospital for observation and curettage, following which she remained in the hospital for about two weeks due to a complication of contracting a cold During the operation the diagnosis of fibroid in the fundus was confirmed, but it was not disturbed The patient, when she left the hospital, was completely recovered but anemic She never returned to the physician thereafter

Some time later an action was begun charging that the physician had negligently and improperly diagnosed the plaintiff's condition as stomach trouble, and had improperly prescribed x-ray treatment therefor It was claimed that at the time the plaintiff was in an advanced stage of pregnancy and that improper diagnosis and treatment caused the plaintiff to suffer a miscarriage and other injuries of an alleged permanent nature

When the case was reached for trial the plaintiff's attorney was not ready to proceed and at his request certain adjournments were granted for the purpose of enabling him to prepare his case for trial Finally the Court granted him no further adjournments, and upon motion of counsel for the defendant, dismissed the action

and observation runs through sixty chapters, to "Tonsillectomy," on page 527 Someone has said that the best postgraduate medical school in the world is the sickroom, and a physician who has had a fifty-year course in this school must have something worth saying

One of his most interesting conclusions is that pneumonia is not a disease Of course this idea is not new Dr Macartney has been maintaining this thesis for more than twenty-five years He devotes pages to it, but one paragraph will give his viewpoint

"I may as well admit that I am unorthodox You are under no obligation to agree with me, nor do I feel under any obligation to apologize for my heresies so long as the mortality remains where it is I maintain that pneumonia can to a large extent be controlled by treatment and that in many cases it can be aborted Morover, I am not only a heretic, but an iconoclast, since I have maintained stoutly since 1911 that pneumonia is not a disease at all Not a disease, but a morbid condition attendant on other affections and infections, a consolidation of lung tissue occurring as a complication in a large variety of infections, diseases, and injuries The term itself is an outworn heirloom from the remote past Etiologically, it includes very many and distinct diseases"

A Lucky Flash of Memory

Some years ago Dr Macartney was hurriedly called to attend a road worker whose carotid artery had been punctured by a sliver of stone. After a wild drive of four miles in a leaping buckboard over a villainous road, he found a fellow workman making compression on the wound, but complaining that "his thumb was getting tired" The doctor got water, antiseptic and instruments ready, then substituted his thumb for that of the laborer It was evident that there was an active hemorrhage from some deep vessel Reading on

No local anaesthetic was at hand, and I had no way of giving him ether I made a swift cut along the line of the sterno-mastoid, turning out a handful of clots Immediately a heavy column of bright arterial blood gushed up and boiled out of the wound, utterly obscuring everything Compression of the carotid from below only partially controlled this There was still an exceedingly active hemorrhage from above through the circle of Willis Additional compression from above with my other hand controlled it, but about this time I ran out of hands To my consternation, when I turned to ask for assistance, I found that, save for my patient, I was entirely alone. They had all fled to the barn which was some distance away I shouted and yelled without avail Temporarily, I felt like a class A idiot.

It seemed to me that something ought to be done about it, but just what I was not prepared to say There was a stout cord within reach, upon which some dishcloths were hanging I knew that, with this about his neck, I could control the hemorrhage but had a feeling that the coroner might be captious Then I recalled having seen in the Wood Museum in New York a specimen showing a ligature around the carotid artery applied by Dr Charles Phelps Confronted with a ruptured carotid aneurism, he had held an aneurism needle between his teeth, threaded it with his free hand, successfully tying the carotid above and below, single-handed This gave me an idea

Lacking a handled needle, I got out a large, full curved Hagedorn needle, meanwhile controlling the hemorrhage with a packing of gauze in the wound compressed with my left hand With my right, I buttoned up my coat, which in my haste I had not stopped to remove. I wove the needle through my coat front and found that, by swelling out my chest pouter-pigeon fashion, I could hold it with sufficient firmness to thread a stout ligature through it. With my one free hand I passed this needle just above the clavicle close to the trachea, bringing it out again well back toward the lateral processes I intended to include everything but the trachea and no doubt succeeded Using my teeth and my free hand, I tied this mass ligature snugly, puckering up the skin and all the included tissues I then reintroduced the needle above, following the same line of procedure I made an earnest attempt to include the base of the tongue, the hyoid bone, the phrenic nerve, and all the odds and ends that might be in that vicinity With both ligatures tied, I removed the packing, found the wound dry and the bleeding fully controlled

With a little easy dissection, I found a punctured wound of the carotid, ligated it on either side, removed the mass ligatures, put in a small silk drain and closed the wound. Luckily, I got a primary union throughout and my patient lived happily ever after Of course, such things don't really happen, but this did I cite this case as an example of what we occasionally encounter, hoping that it may serve a useful purpose This patient owed his life to a happy recollection of the ingenious expedient adopted by Dr Phelps.

REVIEWED

Laboratory Manual of General Physiology By T Cunliffe Barnes, D Sc. Octavo of 116 pages, illustrated Philadelphia, P Blakiston's Son & Co, Inc, 1937 Cloth, $1 00

This manual, by the author of the *Textbook of General Physiology*, is intended for a year's laboratory work in the elementary general physiology of animals It has no special virtue aside from the fact that it has a large number of experiments to choose from, the experiments to be performed and the sequence being matters for each instructor to decide As the author points out, most of the experiments claim no originality, but are taken from other laboratory manuals They are presented in brief fashion, and for the greater part require supplementary reading and explanation for which adequate references are given Many of the references are from the author's textbook

The topics considered include experiments on (1) animal behavior, (2) physical and chemical principles (test tube experiments), (3) irritability, or the response of the organism to external environment, (4) the permeability of living cells, and (5) events occurring inside the organism, i e the *milieu intérieur* in the sense of Claud Bernard

J Raymond Johnson

The Baby's First Two Years By Richard M Smith, M D New and revised edition Octavo of 121 pages, illustrated Boston, Houghton Mifflin Company, 1937 Cloth, $1.75

Dr Smith is a sensible pediatrician of much experience His book has been rewritten and brought up to date It is good, and can be conscientiously recommended to the mother who needs it

Walter D Ludlum

Synopsis of Genitourinary Diseases. By Austin I Dodson M D Second edition Duodecimo of 294 pages, illustrated St Louis, The C V Mosby Company, 1937 Cloth, $3 00

This book covers in a concise manner the subjects of urological practice The author is professor of genitourinary surgery at the Medical College of Virginia, and we imagine the book has grown out of his lecture notes It contains almost everything a medical student should know about this field of medicine. The author has not included the technic of urological surgery, but the indications for special examinations and for surgery are always clearly given.

The text is amazingly up to date and includes the latest therapeutic claims made If the therapeutic agent is very new, as for example sulfanilamide, the author has added the literature references

The illustrations deserve a word of praise. They are well drawn, clear and informative, much more so than blurry photographs of pyelograms would be

Altogether, this is an ideal little book for the student and for the general practitioner who wants to read up on genitourinary diseases

Heinrich L Wehrbein

Biological and Clinical Chemistry By Matthew Steel, Ph D Octavo of 770 pages, illustrated Philadelphia, Lea & Febiger, 1937 Cloth, $8 00

This volume was written expressly for the preclinical medical course in physiological chemistry The increasingly higher standards of the medical curriculum make almost mandatory that the usual physical and biochemical course be accomplished before the student has much appreciation of clinical medicine This specific necessity of blending clinical and pathologic with theoretic is well met. Routine subjects are elaborated by material ordinarily furnished in later courses Beyond the usual experiments, clinical laboratory methods are given practically and in a manner to interest the student in his own metabolic processes Despite its scope and application, the material is carefully and concisely presented References are almost exclusively English and are modern A new text, it meets a demand and should be a welcome addition to the field

Irving M Derby

Some Fundamental Aspects of the Cancer Problem. *Symposium* Sponsored by the Section on Medical Sciences of the American Association for the Advancement of Science. Edited by Henry Baldwin Ward Quarto of 248 pages, illustrated New York, The Science Press, 1937 Cloth, $2 50

This publication by the American Association for the Advancement of Science, comprising thirty papers read at a symposium in December 1936, gives a broad and diversified survey of cancer research

Heredity and constitutional factors are shown to be influenced by environmental changes and play an important role both in the development of cancer and in its localization The importance of chemical agents and sex hormones in initiating, stimulating or inhibiting tumor formation is well presented.

The metabolism of cancer is thoroughly reviewed, and the book contains papers showing the carbohydrate, protein and inorganic salt changes in the metabolism of cancer The metabolism of radium and its

biologic action on cancer tissue is admirably discussed HARRY MANDELBAUM

The Diagnosis of Nervous Diseases By Sir James Purves-Stewart, K.C.M.G. Eighth edition. Octavo of 842 pages, illustrated. Baltimore, William Wood & Company, 1937. Cloth, $10.00.

A work that has passed through eight editions must have an interesting history attached to it, and that is true of this book. It is written by a prominent medical figure who has devoted most of his efforts to neurology.

The book consists of twenty-six chapters with an index and numerous references and illustrations. Its object is to introduce the student and medical practitioner to neurology. It has had a wide circulation and a fine reception from those who are interested in this subject. As expressed in the preface, *the main scheme has remained* the same throughout all the revisions, namely, the description of clinical facts as observed in everyday neurological practice and indicative of their diagnostic significance.

The revision was made necessary to include newer facts and principles as acquired in the general progress made in this field. The book as a whole is an attractive volume that has been of interest to students and neurologists in the past, and will continue to be so in the years to come. It is highly recommended especially to those who are seeking the foundations of neurology.

IRVING J. SANDS

The Thinking Body. A Study of the Balancing Forces of Dynamic Man. By Mabel Elsworth Todd. Octavo of 314 pages, illustrated. New York, Paul B. Hoeber, Inc., 1937. Cloth, $4.00.

This book treats of the physiological mechanics of the human body. It has to do not only with why we have joints but how we use them. It has to do with the upright posture, locomotion and muscle balance. It deals with the physiology of the skeletal body.

Most of us were taught a great deal about the anatomical relations of the various parts of the skeletal body and very little of the purpose of the skeletal body. We were taught the meaning of words but not the construction of the sentence. In this book the author endeavors to explain the function and purpose of the skeletal body and how it does the elaborate things it does. In doing this, balance, stress and strain, and thrust must all be considered along with coordination and rhythm.

In giving this work to the medical profession the author has made a basic contribution in a field that is rarely recognized by the average doctor, and one in which much work is still to be done.

JA. C. RUSHMORE

Maternal Deaths—The Ways to Prevention. By Iago Gladston, M.D. Octavo of 115 pages. New York, The Commonwealth Fund, 1937. Cloth, $.75.

The prevention of maternal mortality is a subject in which "all doctors and all the people" should be interested. Unless the public is interested in reducing the number of deaths associated with childbirth, the doctors will never be able to accomplish the desired results. Education is "the keystone of the arch of success" in reducing mortality in general and maternal mortality in particular.

This small volume contains a concise discussion of the problem, and offers proposals for doctor, nurse and layman to reduce the high death rate coincident with childbirth. The author does not claim originality, but frankly states that he has only attempted to correlate known facts. How well he has succeeded can only be known by a close study of the booklet. It seems almost incredible that so much understandable material and standardized facts could have been packed into 110 pages.

The booklet is highly recommended for doctors, nurses, affiliated organizations and laymen, and we venture the opinion that, if its distribution could be sufficiently extensive throughout the country, our maternal mortality would be materially reduced within a very short time.

HARVEY B. MATTHEWS

Recent Advances in the Study of Rheumatism. By Frederic J. Poynton, M.D. and Bernard Schlesinger, M.D. Second edition. Octavo of 380 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc., 1937. Cloth, $5.00.

This small volume, a second edition, covers practically every aspect of the rheumatic state. Under this heading are included acute rheumatic fever, subacute and chronic states of the same disease, chronic arthritis, fibrositis, and allied states. The authors comment on a criticism of their first edition, that it carried "an atmosphere of doubt and indecision." The reviewer would champion the stand of the writers, and point out that one of the charms of their book is its lack of dogmatism in a disease the etiology of which is still not known. Poynton and Schlesinger have done much to correlate clinical and laboratory truths. Their book is not one of factless generalizations, but true to the well-recognized British tradition of exactitude in medical research, it takes noth-

ing for granted The work is a veritable storehouse of knowledge on the subject, and should be heralded as one of the very best.

GEORGE E. ANDERSON

Latent Syphilis and the Autonomic Nervous System By Griffith Evans, M A, F R C S Second edition Octavo of 157 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $3 00

In this comparatively small book the author has listed numerous cases of thyroid disease, allergy, asthma, dysphagia, dyspepsia, abdominal complaints, with or without adhesions, and finally, cancer from his own practice that he has definitely linked up to latent or heredo-syphilis

It would be difficult to prove a fallacy in his arguments connecting these conditions in the light of much that we do know regarding syphilis, especially when we consider how much is still unknown One may dispute the diagnosis in many instances, and may also hold that the response to therapy with iodides, bismuth and mercury is not, in itself, sufficient proof of syphilis

No matter what attitudes one takes toward the diagnosis of the specific cases, the author has rendered a service in calling attention to the manifold possibilities of syphilis as an underlying cause in a large number of obscure maladies

The reviewer feels the time spent in reading this book will be used to good advantage

E ALMORE GAUVAIN

A Practical Treatise on Diseases of the Skin for the Use of Students and Practitioners. By Oliver S Ormsby, M D Fifth edition Quarto of 1334 pages, illustrated Philadelphia, Lea & Febiger, 1937 Cloth, $12 00

Oliver S Ormsby is recognized as one of the country's outstanding dermatologists His textbook on dermatology and syphilis is well known as a standard work on the subject for students and practitioners

This fifth edition of his book has been thoroughly revised and brought up to date, and includes twenty new diseases In fact, all advances in dermatology have been incorporated

The first chapters are devoted to the elements of dermatology Subsequent chapters take up the subject according to the old classification of skin diseases which to the reviewer's mind is much simpler than the new

The chapter on x-ray therapy unfortunately is very short, and the reader will have to consult more detailed works for full information on this subject The same criticism is made of industrial dermatoses which is an important subject today, and should receive more attention

Dermatological literature has been carefully reviewed, and should be of value to the dermatologist, who will appreciate the exacting labor of gathering such data.

The book is printed in exceptionally clear type on a fine paper with a hard glossy surface making it a pleasure to read. The illustrations are numerous and remarkably clear The individual lesions stand out distinctly This is a valuable feature of the book

Ormsby's treatise on Diseases of the Skin has always been a sound and practical textbook The fact that this is the fifth edition is evidence of its popularity and value.

ALFRED POTTER

Fractures and Dislocations for Practitioners By Edwin O Geckeler, M D Octavo of 252 pages, illustrated Baltimore, William Wood & Company, 1937 Cloth, $4 00

This generously illustrated book makes no pretense of being a complete study of fractures and dislocations, but merely promises a condensation of the subject without the omission of essential details It stresses the important fact that proper early care by the practitioner may influence favorably the end results, and emphasizes only accepted present-day methods in immediate treatment.

Although the author takes occasion to refer to the dictum of "Treat them where they lie," the question of transportation might, with profit, be considered more seriously, and then dignified with a special reference in the index We respectfully suggest that the author, in his second edition, modify or qualify the statement he makes in speaking of deformity from angulation (malunion) "This altogether too common complication is inexcusable." There seems to be a lot of finality in the last word of the quotation The list of references is found at the close of each chapter, a definite convenience to the reader and to those seeking additional information We believe that a book of this type serves a useful purpose This one should have a special appeal to the practitioner

Occupational Therapy

Treatment by occupational therapy has developed rapidly within the past two decades It has become a specialty requiring skilled technicians and a diversity of facilities, which in practically every case can only be supplied by well-administered institutions

Many comments have been made by prominent physicians and surgeons concerning the merits of this form of therapy

Dr Thomas W Salmon, before his death, prophesied, "Occupational Therapy will some day rank with anesthetics in taking the suffering out of sickness and with antitoxins in shortening its duration. The greater part of distress in chronic diseases is mental, and Occupational Therapy is thus far our only means of dealing with this factor"

Dr C Floyd Haviland, who was President of the American Occupational Therapy Association at the time of his death, once said that Occupational Therapy was the most important and valuable method of treatment that had been introduced in mental hospitals in twenty-five years

A leading school in Occupational Therapy, defined the treatment—"Occupational Therapy aims to furnish a scheme of scientifically arranged activities which will give, to any set of muscles or related parts of the body in cases of disease or injury, just the degree of movement and exercise that may be directed by a competent physician or surgeon, stimulating heart action, respiration and blood circulation accurately as prescribed, and at the same time it yields some of the joy and satisfaction that wisely selected, wholesome occupation provides in normal life. It thus takes it place with nursing, medicine, and surgery as one of the important departments of medical art"

For the type of case requiring occupational therapy, an institution equipped for this type of treatment should be selected by the physician recommending a patient to a sanitarium or private hospital A good choice can always be made from this section of your JOURNAL

NOTES FROM OUR ADVERTISERS

Parke, Davis & Company Elects New President and New Finance Chairman

Dr A William Lescohier was elected President of Parke, Davis & Company, and Norman H F McLeod Chairman of the Finance Committee, at a meeting of the Company's Board of Directors held in Detroit on March 1 Both men have been actively connected with the Company for about thirty years Dr Lescohier has been General Manager and a Director since 1929, and Mr McLeod a member of the Board since 1921 and Secretary and Treasurer since 1923

Dr Lescohier succeeds Oscar W Smith, who had been President of the Company for sixteen years until his death on February 7 of this year Dr Lescohier was born in Detroit, a few blocks from the laboratories of which he now becomes the chief executive. After graduating from high school he worked a year or two in the laboratories and then enterted Detroit College of Medicine In 1909 following his graduation from college, he became a member of the Parke-Davis Research Staff giving special attention to biological problems In 1918 he was named Assistant Director of the Research and Biological Laboratories in which capacity he was in charge of the production of serums vaccines antitoxins, and other biological products In 1925 he was made Director of the Department of Experimental Medicine and in 1928 he was appointed to the position of Assistant to President. In 1929 he was elected General Manager, which position he has occupied since that time

Mr McLeod continues as Secretary and Treasurer of the Company as well as a Director in addition to his new post as Chairman of the Finance Committee. He was born in London Ontario, and after graduating from high school embarked on a banking career, taking a position with the Canadian Bank of Commerce. Coming to Detroit in 1898 he became connected with the Detroit Stove Works where he remained until 1906 In that year he joined Parke, Davis & Company as Traveling Auditor and in this capacity he travelled all over the world visiting the many laboratories and branches of the Company In 1917 he was appointed Chief Auditor In 1921 he was elected to the position of Treasurer and made a member of the Board of Directors In 1923 he was made Secretary and Treasurer of the Company

Carriage and Culture

A man and his wife with greying hair sat in the lobby of a large hotel watching the young people arrive for an evening party

"Some very fine gowns there," said the man

"Yes, but the girls don't know how to carry them," replied his wife. "Not one girl in ten here tonight knows how to walk That was one of the things we had to learn when I was at boarding school You can always tell a cultured, well-bred girl by the way she carries herself Nine-tenths of these girls walk in a slouchy, sloppy way that marks them at once as below par socially"

A graceful step, combining elegance and harmony with ease of action and attitude, creates a favorable impression instantly, and it can be learned by any young woman with proper instruction. It is one of the things invariably taught in the best girls' schools and, combined with many other elements, produces the girl who is "well turned out" and is able to take her place in any sphere of society

Then, too, who can deny that fine habits of walking and carriage have their effects on habits of the mind? The man who steps with firm, strong tread will naturally develop a strong, decisive way of thinking and acting The girl who moves with grace and harmony will acquire the social ease of a cultured woman

Education means more than books It takes in the whole life and training of the growing boy or girl, and our best schools neglect no part of it.

The School-Child's Breakfast

Many a child is scolded for dullness when he should be treated for undernourishment. In hundreds of homes a "continental" breakfast of a roll and coffee is the rule. If, day after day, a child breaks the night's fast of twelve hours on this scant fare, small wonder that he is listless, nervous, or stupid at school A happy solution to the problem is Pablum, Mead's Cereal cooked and dried. Six times richer than fluid milk in calcium, ten times higher than spinach in iron, and abundant in vitamins B and G, Pablum furnishes protective factors especially needed by the school-child. The ease with which Pablum can be prepared enlists the mother's co-operation in serving a nutritious breakfast. This palatable cereal requires no further cooking and can be prepared simply by adding milk or water of any desired temperature. Its nutritious value is attested in studies by Crimm *et al* who found that tuberculous children receiving supplements of Pablum showed greater weight-gain, greater increase in hemoglobin, and higher serum-calcium values than a control group fed farina
